" 6. We hope that it will be possible to obtain all the moorum required for the Back Bay scheme in the vicinity of the Kandivli quarries and bring it down from time to time as each section of the reclamation is completed, and we would emphasise the fact that as the deliveries will be spread over five years, or probably more, it should be possible by judicious arrangement to transport the moorum without undue interference with the transport of the stone."

Mr. Lewis to Sir George Buchanan. 22*nd July*, 1921.

" As far as the moorum is concerned, I think that the total quantities will be much less than we have allowed for. In the first place, it would not be any use putting moorum over the areas to be devoted to gardens, parks, &c., for nothing but the very hardiest things will grow on moorum, which always contains a good proportion of stones. Then on spaces to be devoted to house building, it seems rather unnecessary to place moorum over the spaces actually covered by the houses. All foundations will have to be taken down to bed rock and the floors will probably have to be suspended on girders, so that the utility of having two foot of moorum over the areas, other than those on which the roads will be laid, seems very doubtful."

Mr. Lewis to Meik & Buchanan. 28*th July*, 1921.

" I have to acknowledge receipt of your letter of the 7th July, 1921, referring to the material to be dredged from the harbour and the quantity to be used for moorum topping.

" I have noted your remarks and do not propose to go further into the subjects until we find by experience what is the character of the material we have to deal with.

" As regards the moorum, I had come to a very similar conclusion as to the extent to which it would be required, as you will see from various letters that I have written to Sir George Buchanan."

Letter from Sir George Buchanan to Sir Lawless Hepper. 8*th June*, 1922.

" In the matter of dredging it seems to me that for some reason of his own Lewis has made up his mind to delay operations as long as possible and to begin reclamation at Marine Lines instead of at Colaba."

Letter from Sir G. C. Buchanan to Mr. O'Rorke. 5*th July*, 1922.

" Mr. Meik and I have been discussing the dredging problem and although if good material is found in Back Bay it will be very useful for the Marine Lines end of the reclamation we cannot see that it will be practicable to dredge from Back Bay for use at Colaba or indeed for the bulk of the work.

" The samples sent by you are not particularly good and you do not mention if there is any sand overlying the hard moorum bed."

Sir G. C. Buchanan to Mr. O'Rorke. 13th June, 1922.

" In the matter of dredging, you observe that a detailed survey of Back Bay is required to determine the possibility of dredging there instead of in the harbour as this year's preliminary operations showed there was a large area of dredgable deposit of better quality than that available in the harbour. We certainly never understood that there was any suggestion that all the material for reclamation could be got from Back Bay."

Sir George Buchanan to the Chief Engineer. 11th December, 1922.

" With reference to the informal conference on the 8th instant on the subject of dredging at which were present yourself and Messrs. McMurray and Halcrow, I think it may be as well to record briefly what occurred.

" (1) To begin with I pointed out that the successful reclamation of the enclosed area by pumping material dredged from the sea bed was the crux of the whole scheme. I said that the general plan of operations proposed by Mr. Kidd, viz., dredging from the harbour side of the Colaba Peninsula and pumping through pipe lines across the peninsula had been accepted and arrangements made accordingly. Further that we were aware that you had been investigating the prospects of obtaining materials from Back Bay itself and we agreed that a portion of the area near Marine Lines might most usefully be so reclaimed, but that your idea of reclaiming the whole area by dredging from Back Bay was a deviation from the original and sanctioned project which required very grave consideration, the responsibility resting with my firm.

" (2) It is understood that you have fears as to the suitability of the material in the harbour although Mr. Kidd took a great number of borings and expressed himself as entirely satisfied with the result and Mr. McMurray observed that too much credence should not be given to borings as from his experience at Sewri borings were found to be unreliable.

" I remarked that in my judgment the first thing to do was to ascertain the precise nature of the material in the harbour by a practical test and we discussed the various methods short of beginning the reclamation, viz., by grab dredger, the " Kalu " or by a bucket dredger borrowed from the Port Trust, and finally, Mr. McMurray suggested that the new large grab dredger being built for the Port Trust and expected out in a few months and which had to be tested somewhere might be requisitioned for the work. It was then agreed to negotiate with the Port Trust for her use.

" (3) With reference to Back Bay it is understood that you are continuing your investigations and it was suggested you might obtain from home a heavy Priestman grab using it with your own crane and barge.

" (4) Your programme of work contemplates beginning dredging operations in the season 1924-25 and I emphasised the tremendous importance of starting before that date and said it had certainly been our intention to lay the first pipe line across the peninsula at the earliest possible date and get the dredger to work. It was then agreed that the dredger must begin work not later than the end of 1923 monsoon."

132. From the correspondence it would appear that in the first instance the Bombay Port Trust were only concerned with the possible effect on the channels and currents of the harbour of the removal of large quantities of material and the first intimation we had that there was to be any curtailment of the area selected by Mr. Kidd was conveyed to us in a letter from the Chief Engineer, dated 7th September, 1921, forwarding the correspondence with the Bombay Port Trust and the Royal Indian Marine on the subject. The Port Trustees in addition to curtailing the area observed that they had been advised they should be compensated for the removal of the soil, &c., from the bed of the harbour. The action of the Port Trust came to us as a great surprise. Mr. Kidd in his report, dated 3rd August, 1912, stated, " It has been assumed that no royalty will be payable for the removal of the mud and clay from the harbour," and as the Government of Bombay had accepted Mr. Kidd's scheme and forwarded it to the Government of India with the remark that all doubtful points had been settled, one might be excused for thinking that the Government of Bombay had long ago investigated any rights or supposed rights of the Port Trust or Indian Marine.

133. In a note to the Director of Development, a copy of which accompanied the chief engineer's letter to us dated 7th September, 1921, he pointed out that the reduction

of material due to the restrictions demanded by the Port Trust and the Royal Indian Marine amounted to 15,572,896 cubic yards, and he suggested that this quantity should be obtained by extending the dredging area out into the harbour which would, however, entail the purchase of additional pipe line.

134. The extracts from the correspondence also show that our anxiety as to the quality of the material was largely connected with the depth of moorum it would be necessary to lay on the pumped filling for the purpose of making the reclaimed area fit for use. Otherwise we had and we still have no doubt that the material is available in the harbour in abundance for the working of the dredger. The Chief Engineer was obsessed with the idea that possibly all the material could be found in Back Bay, and in his report, dated October, 1922, accompanying his project estimate he remarked :—

> " There is a possibility which is being investigated of material being obtainable from Back Bay, but this point is not yet decided, and it is considered desirable to make provision for the trenches and the shore pipe line should it be necessary owing to the investigation giving negative results."

135. The Chief Engineer's programme of operations did not contemplate beginning dredging until 1924-25. We strenuously combated that idea, with the result that dredging began in 1923-24, but in our opinion there was no reason why dredging should not have been started in 1922-23. With regard to dredging in Back Bay we did not initiate that proposal, but welcomed the idea that as the dredger " Kalu " happened to be available she should be employed to augment the work to be done by the " Sir George Lloyd."

136. We relied on the statement made by the chief engineer as to the quality and quantity of the material in Back Bay, but as events have turned out the borings taken by Mr. Thomas under the supervision of the chief engineer have proved wholly unreliable.

137. As regards the dredger " Sir George Lloyd," we hold the opinion that whatever the class of material (short of hard rock and moorum) no better dredger could be procured for the purpose of the scheme, and criticisms on the mechanical efficiency of the dredger are beside the point, because up to the present the dredger has had no opportunity of showing what she can do.

138. I do not propose in this statement to discuss in detail the working of the dredgers during the two seasons when I was in Bombay. A great deal has been said about soft clay, unctuous clay and hard clay, but the fact remains that there is, I firmly believe, an ample supply of suitable material to feed the dredger if she is properly handled—Mr. Brims, the dredging superintendent, has said that the dredger could do her specified output for possibly a month on end, and if for a month, why not for six months. He also said he accepted Mr. Kidd's soundings, &c.

139. Mr. Girdwood had no fault to find with the dredger and said the cutter would remove any material in the harbour, down to a certain depth, presumably until the hard was reached.

140. The human factor is, however, all important and until proper team work is instituted along with a 24 hour day and a bonus on output the results are bound to be unsatisfactory.

Summary.

141. My considered opinions on the scheme and on the events that have taken place since the work began are as follows :—

(1) There was no undue haste shown by anybody in proceeding with a work which was begun in 1865, had been discussed and rediscussed for years, and for which no fewer than 18 different sets of plans and estimates had been prepared since 1887.

(2) Certain sections of the community in Bombay have always exhibited violent hostility to the scheme, and this was intensified with the slump in land values which has occurred during the last year or two.

(3) The Governor of Bombay (now Lord Lloyd) was justified in his attempt to break through the traditions of the Public Works Department and get the work put in hand as soon as possible after it had received the sanction of the Secretary of State, and the procedure adopted was a very usual one. All great schemes, however well planned, require perpetual reconsideration and revision to meet new problems, and this work was no exception to the rule.

(4) In the matter of the estimates, I insist that my original estimate of 367 lakhs was reasonable and reliable and that Mr. Kidd's estimate of 1912 was excessive. I resent the suggestion made by a member of the Committee that my estimate was made low in order to obtain administrative sanction or to show a

profit on dealings in land, and in this connection it must be borne in mind that even on the 702 lakh estimate the Government of Bombay prepared a statement in which an ultimate profit was shown amounting to 369 lakhs of rupees. Estimates for engineering works in the East advanced between 1912 and 1919, but the great advance was between 1919 and 1922, largely on account of the sudden rise in the price of labour as well as in all materials.

The estimate of the chief engineer in 1922 for 702 lakhs should have 136 lakhs deducted to make it comparable with my estimate for 367 lakhs, and I believe a contractor freed from Government restrictions would have completed the work and made a profit on the chief engineer's estimate. Moreover, I still think that the work can be completed within a reasonable margin of that estimate.

The estimate of 1,100 lakhs prepared by the Special Advisory Committee under the chairmanship of Sir Lawless Hepper was admittedly " prepared to order " and was not an engineer's estimate. It would be interesting to know precisely the reason for its preparation and publication.

(5) Regarding my responsibility, I have no desire to evade any responsibility or unduly to blame anyone else. During the course of this enquiry I have been subjected to attack not only by witnesses but by members of the Committee. I quote below the statements made by members of the Committee along with my explanation.

4.8.26. *Sir F. Hopkinson.* Witness: *Sir Lawless Hepper.*

Q.—Sir George Buchanan says that for years he has been struggling against Government extravagance and inefficiency. Is not he responsible for extravagance and inefficiency?

A.—Exactly.

13.8.26. *Sir F. Hopkinson.* Witness: *Mr. H. S. Elgee.*

Q.—Is it not a fact that if anything has gone wrong with the provision of plants, the control and conduct of the works out here, it is to be attributed in the end entirely to Sir George Buchanan. Was not he the chief engineer in direct control of the whole scheme?

A.—Yes.

Q.—In fact, he is just in the position of a contractor and the chief engineer is in the position of a contractor's agent?

A.—Quite so.

Q.—If a contractor tells you to do a work, as his agent, you are responsible for carrying on the work only as he has ordered you?

A.—Yes.

16.8.26. *Sir F. Hopkinson.* Witness: *Mr. C. K. Chitale, R.B.*

Q.—I used the wrong term just now, namely, consulting engineers, Messrs. Meik and Buchanan were not consulting engineers—they were the engineers controlling the whole work. So far as the control of the work was concerned, *they were in an almost identical position to contractors*?

17.8.26. *Sir Frederick Hopkinson.* Witness: *Mr. H. S. Elgee.*

Q.—On the 18th May, 1922, he (Sir George Buchanan) wrote another letter on the same terms saying that " We are still unconvinced that you require three of these machines at once, estimated to cost over £12,000, nor do we understand why you want 20 tons lifting power when the very heaviest of the protection blocks shown on our last drawing, No. 3259, is only 15 tons." It was for Sir George Buchanan to say, " I do not think these are necessary, and therefore I shall not supply them?"

A.—He could have done so.

Q.—If he had been in close touch with the work, surely he could say that without putting the responsibility on somebody here?

A.—I think so.

5.8.26. *Sir M. Visvesvaraya.* Witness: *Sir Lawless Hepper.*

Q.—As regards expenditure for a huge work of this magnitude, responsibility must be that of the Director of Back Bay Reclamation works.

A.—I am prepared to go as far as this. In connection with the work, it was necessary, from time to time, to let out contracts for the supply of material or for loading or for unloading stones. They were not large contracts, they were petty contracts and strictly speaking, in the terms of that agreement, I think, all the tenders on every occasion were sent to the engineers as an ordinary matter of working and having regard to the fact that Sir George Buchanan was sometimes in Australia and sometimes in Africa and at other various places, it was not practicable to send all cases of tenders for contracts that used to arise. But it may be said that in those cases I was responsible for that expenditure on them, but having tacitly accepted the situation, I think, it might be said that he was responsible.

With reference to the statements that I was in the position of a contractor and the chief engineer that of contractor's agent, or that I was responsible for extravagance and inefficiency, I would in the first place point out that I am not a contractor and I would then ask Sir Frederick Hopkinson whether he or any other contractor would undertake the smallest responsibility on the relations that actually existed between Sir Lawless Hepper and the Development Directorate on the one hand and myself and my firm on the other, viz. :—

(1) We had no power to appoint or dismiss staff or workmen. When the chief engineer whom we had nominated completely broke down through ill-health we protested, and again protested, but found it absolutely impossible to secure his removal or transfer. Would any contractor take on a work if he was told that under no circumstances whatever could he get rid of his chief engineer?

(2) We had nothing whatever to do with the employment of labour, rates of pay or the letting out of the numerous sub-contracts of all descriptions; nor were we consulted about the purchase of materials and stores in Bombay. Sir Lawless Hepper himself fixed the contract for the cement and he had a special supply department which provided stores and materials for all the work being carried out by the Development Directorate including the Back Bay scheme.

Sir Lawless Hepper erred when he said that tenders were sent to the engineers as an ordinary matter of working. I can only recall to my mind two occasions on which we were advised, and for our information only, that contracts had been placed; one was in the case of the cement and the other was in the case of some pipes for the dredger which were manufactured in Bombay.

Sir Lawless Hepper has made the remark that Sir George Buchanan was sometimes in Australia and sometimes in Africa and it was not practicable to send all cases of tenders for contracts that used to arise. What an extraordinary statement! I was not carrying out our duties single-handed. I was not even the engineer. My firm were the engineers and we had an office and staff in London actively engaged in carrying out the whole of our business.

(3) With reference to plant ordered in England, we received indents and carried out instructions. On one occasion we advised against the purchase of three steam shovels and Sir Frederick Hopkinson remarks that it was only necessary for Sir George Buchanan to say, " I do not think these are necessary and therefore I shall not supply them." That statement is absolutely incorrect. The matter was placed before Sir Lawless Hepper as the head of the Development Directorate and he passed an order that the cranes were to be purchased and there the matter ended.

(4) When I visited Bombay it was as an adviser. I had no power to say to any man on the works, " Do this or do that," as I was in no sense an executive officer. Sir Lawless Hepper was the supreme executive head of the Development Directorate. Sometimes he took my advice and sometimes he preferred the advice of his own Chief Engineer. Moreover, I had never any intention of being anything but an adviser and our fees were based on that arrangement. Had I taken charge, in the sense that Mr. Kidd proposed to take charge, I should have required corresponding fees.

(5) The provision of adequate and efficient staff was always difficult. The first year that dredging started I arrived in Bombay and found one man alone in charge of the large dredger, and on my asking what would happen if that man got an attack of fever, or any other complaint, I was

told that the dredger would have to stop work until he got well again, and it was only on my urgent representation of the case that sanction was accorded to sending a cablegram to London to get out an assistant dredging master.

(6) We were never supplied with the usual engineering details of cost, in fact I doubt if anyone ever knew what the work was costing.

(6) The creation of the Development Department and Directorate I consider, in the light of events, to have been a mistake. The Governor of Bombay (now Lord Lloyd) hoped that he would institute a new department with fresh blood, freed from the restrictions and red tape of other departments, but when he disappeared from the scene, and with him the only driving force in Bombay, the Development Directorate degenerated to an ordinary Government Department, slavishly following other departments and hide-bound by rules, regulations and restrictions.

It was a public works department being carried out on exactly similar lines to the recognised Public Works Department, and subjected to precisely the same rules and regulations, but without its experience. One branch only of the Development Directorate's activities have been examined, and I suggest valuable information would be obtained by inquiring into the expenditure and results obtained in the other departments.

(7) Regarding the Back Bay scheme, the position at present is that the constructional works as designed have proved an unqualified success. Grave doubts were expressed in Bombay as to the possibility of building at reasonable cost a wall strong enough to resist the force of the sea, and I was brought out to Bombay one year especially to observe the force of the waves, but the sea wall, as built, has resisted successive monsoon storms, and will, when the works are completed, provide a handsome sea promenade.

The filling in of the reclaimed area by the dredgers has certainly not come up to expectations. A great deal has been said about the quality and quantity of material in the harbour and the efficiency of the dredger, but very little consideration has been given to the human element in the working of the dredgers. My view is that there is an ample supply of suitable material in the harbour, and that the dredger can perform all that it was required to do under its contract and specification, but that the human element has failed completely, and under existing conditions I do not see how it can possibly do otherwise. My advice is to free the work from the incubus of Government control, get rid of the whole staff before next working season, and invite tenders from contractors for the completion of the entire work. Mr. Merrett, the Assistant Dredging Master of the dredger " Sir George Lloyd," in the course of his evidence, summed up the situation admirably. When asked in what respects the dredging in Bombay differed from work done elsewhere, he replied : " One is run by a private company and they want their pound of flesh. If you do not turn over the percentage, you have to make room for someone else."

(8) Lastly, there has been a disposition in Bombay to treat this large work (probably as large a dredging proposition as the world has seen) on a par with the building of a house or other cut-and-dried operation, and the moment anything went wrong there was condemnation of all concerned and an outcry to stop work.

This, if I may say so, is a most narrow and parochial view. The work might be regarded for India as a national undertaking and should be completed. In this particular case there have been overwhelming reasons connecting with the state of the world for the original estimate being increased. All estimates for works were similarly increased, and it would be of interest to know what increase has taken place in the estimates for the building of New Delhi, but to take one example out of many of works carried out long before the War. The original estimate for the Manchester Ship Canal was in the neighbourhood of £5,000,000, whereas the actual cost was nearer £15,000,000. Now that the work is completed you hear no complaints from the City of Manchester—which is every day reaping the benefit of this great undertaking.

I emphatically assert that the Back Bay Reclamation Scheme inaugurated by Lord Lloyd is not a failure, and there is no reason why it should not be brought to a triumphant conclusion.

The slump in land values which at present obtains is not going to last for ever, and the day will yet come when Lord Lloyd's foresight and energy in the enterest of Bombay will be recognised and gratefully appreciated.

GEO. C. BUCHANAN.

ORAL EVIDENCE.

Sir H. Courthope-Munroe, K.C.—I understand that, by the courtesy of the Committee, I am allowed to appear here to a limited extent to represent Sir George Buchanan. I appear with my friend, Mr. Melville. I understand that after you have examined Sir George, if there is any matter which he desires to go into a little more fully, or if there are any matters which have been dealt with by the Committee which he thinks want clearing up, the Committee will allow me to put further questions. I understand that to that extent only I am allowed to take part in the evidence.

Chairman.—That is exactly right, Sir Harry.

Sir George Buchanan; called and examined.

Chairman.—The statement you have been good enough to prepare for the Committee will be printed in its entirety as a preface to your evidence, Sir George. Before I commence examining you there are one or two small matters in relation to your statement which I would just like to clear up. On Page 1, the first line, you say "When I first examined the project in 1918." Does that mean "1919"? It was on the 7th May, 1919, that you got a telegram?

A.—Yes, that is so; it is 1919.

Q.—Then may "1918" be corrected to 1919? Then will you read on? You say "The date of the first scheme was 1865." We have got it from official documents that in fact the date was 1863.

A.—I accept that.

Q.—Will you therefore correct "1865" to 1863, just to get the record right. Then on Page 19 you say "A meeting was held in Mr. Carmichael's room in the Secretariat at which were present the Hon. Mr. Carmichael, now Sir George Carmichael, Sir Stanley Reed, Mr. Billimoria, representing Tata Sons, Ltd." As there is a Mr. Billimoria, on this Committee, it might be clearer if you would put "Mr. A. J. Billimoria, partner in the firm of Tata Sons, Ltd."

A.—Yes, I quite understand.

Q.—Do you consent to that correction?

A.—I do.

Q.—There is another matter on Page 112. I will hand you this document and ask you to look at the underlining in green. If you turn over the page you will see the question which you set out in your statement.

A.—Yes.

Q.—Now will you substitute "Sir F. Hopkinson" for "Chairman" on Page 112 of your statement?

A.—Certainly.

Q.—Just satisfy yourself first?

A.—Yes. I will do that.

Q.—With those four corrections the statement might be released. I think it will be more convenient to take you through your statement almost page by page. Will you turn to the first page? When you first examined the project in 1919 did you first of all make yourself acquainted with the history of previous reclamations in Back Bay?

A.—I did.

Q.—We have been told that Bombay is built upon seven islands, and Lord Lloyd in his evidence has referred to reclamation going back to the early part of the 18th century?

A.—Yes.

Q.—Did you read the evidence of Sir Stanley Reed?

A.—I have seen his evidence.

Q.—Did you notice whether or not he indicated that Bombay owes it distinguished position to successive reclamations?

A.—Yes.

Q.—The joining up of various islands and making solid ground, and the driving back of the sea along the actual sea front?

A.—Yes.

Q.—Is Sir Stanley Reed a gentleman of large experience in Bombay matters?

A.—I have always understood so.

Q.—He was the Editor of "The Times of India" for very many years, was he not?

A.—Yes.

Q.—And associated with many public affairs in Bombay?

A.—Yes.

Q.—He was a man who might be presumed to be reasonably likely to form a good judgment?

A.—Yes.

Q.—The first scheme which you deal with is what we now know as the 1863 one. That was a scheme to reclaim 1500 acres of the foreshore?

A.—Yes.

Q.—Therefore not dissimilar in extent to the reclamation scheme which we are now investigating?

A.—A little larger.

Q.—Larger as 1145 acres is to 1500 acres?

A.—Yes.

Q.—You say that owing to financial difficulties that company was voluntarily wound up. I think we have got it from Sir Stanley Reed that the company in fact did make some reclamation between 1863 and 1866?

A.—Yes, I have always understood so.

Q.—Which he said was of immense advantage to Bombay?

A.—Yes.

Q.—And the company failed, not by reason of any inherent weakness in the feasibility of the scheme, but because of the North and South War acting on the industries of India and bringing down the Asiatic Banking Corporation?

A.—That is so.

Q.—The company had got on deposit 90 lakhs in the Asiatic Banking Corporation, and its failure caused the Development Company to go into liquidation. Then you deal with 1887. The Government of Lord Reay proposed a scheme. Then again in 1897 the matter comes up under Lord Sandhurst. Then the Bombay Improvement Trust became interested in reclamation, and in addition to that there was in 1904 the Military Lands Committee. It is all set out in your statement, Sir George, and is set out correctly.

A.—Yes.

Q.—In 1905 did the Bombay Public Works Department propose four alternative projects?

A.—Yes.

Q.—And was it in 1905 that it was first suggested that reclamation should be effected by pumping across the peninsula from the harbour into the area to be reclaimed?

A.—Yes, I understand that was the first occasion.

Q.—And a year later, in 1906, there was, I think, a revised scheme dealing with 973 acres in Back Bay and 121 acres in Colaba?

A.—Yes.

Q.—So far we have got: 1887, Lord Reay; 1897, Lord Sandhurst; the Bombay Improvement Trust; the Military Lands Committee; 1905, the Bombay Public Works Department; and then in 1907 Lord Lamington appointed a Commission. So that up to that time from 1863 to 1907, had the matter been under discussion by a large number of bodies, looked at from a good many angles?

A.—Yes.

Q.—Now I come to February, 1908. In that month did Messrs. Lowther & Co. submit a scheme of a very ambitious nature to reclaim 3576 acres or 2945—one or the other?

A.—Yes.

Q.—And they offered their services to make surveys and investigations?

A.—Yes.

Q.—On the 27th October, 1910, did they put forward a proposal to reclaim 1272 acres at a cost of 358 lakhs?

A.—Yes.

Q.—When putting forward that estimate, did they state that they had been given all data in possession of Government?

A.—Yes including a series of borings in the harbour.

Q.—Was it also their recommendation that Government should do the work through the agency of a contractor on certain terms of remuneration?

A.—Yes.

Q.—On the 21st January, 1911, there comes an important letter from the Secretary of the Government of Bombay to the Secretary of the Government of India?

A.—Yes.

Q.—Is the substance of that letter to this effect—that Messrs. Lowther & Kidd had previously carried out the execution of the work in relation to the Government Dockyard in Bombay; they had intimate knowledge of local conditions; and, on Page 4,

"The reclamation will be effected by means of suction dredgers working in the harbour on the east of Colaba where the presence of an ample deposit has been ascertained, and delivering the clay at the site of the reclamation—the most efficient and economical method of carrying out reclamation on a large scale"?

A.—Yes.

Q.—Did the letter further remark that if general approval were given about 1,000 acres would be attempted to be reclaimed, and that they would require to have the necessary surveys made and estimates prepared?

A.—Yes. There is this point: "expressed his willingness to prepare designs and working drawings." Up to then they had not been prepared.

Q.—True. Then the letter says: "Immediately on receipt of the general approval of the Government of India and of the Secretary of State to the proposals submitted"—that is, the Bombay Government were urging that this reclamation should go through on the lines proposed by Mr. Kidd?

A.—Yes.

Q.—It is on page 4 of your statement. I will read it: "Immediately on receipt of the general approval of the Government of India and of the Secretary of State to The proposals submitted, the Bombay Government would cause the necessary surveys to be undertaken and estimates to be prepared, when the whole question would be thoroughly re-examined from a financial point of view, and the most promising scheme submitted to the Government of India. Concluding, the letter went on to say that enough had been said to show that a scheme of reclamation would not only provide for an urgent need of the city of Bombay, but would also prove a sound financial undertaking of the nature of a productive public work which the Bombay Government regarded with great confidence. The Government of India was, therefore, requested to submit the proposals to the Secretary of State for his general approval, as the Governor in Council was anxious the actual work should be commenced with the lest possible delay."

A.—Yes.

Q.—Then a period of nine months elapsed before the Government of India replied. On page 5 of your statement the Government of India are quoted as saying:—"Before any representations could be made to the Secretary of State it had to be made clear that the works would be reproductive, and for that purpose there was practically no data available. The Government of India did not wish to question the accuracy of the skilled engineers who had advised the Government of Bombay, but their figures had not been placed before the Government of India, and all that could be said on a general review of the case was that large estimates of that type were particularly liable to be exceeded, and that even in Bombay experience of reclamation on an open sea front of the type proposed was limited. On the proposal that the scheme, if undertaken, should be executed by Government in preference to private agency, the Government of India was not convinced, on the information before it, that the scheme, if undertaken, should be executed by Government in preference to private agency, and therefore asked that the matter should be further investigated. Finally, the Government of India asked what would be the cost of the detailed surveys and estimates, as these would be necessary before the scheme could be recommended to the Secretary of State"?

A.—Yes.

Q.—Then that is followed by a letter from the Government of Bombay to the Government of India on the 6th December. In that letter it was set out that the firm of Lowther and Kidd had offered to execute a detailed survey and investigation of the site for 1 lakh 57,500 rupees—a little over £11,000?

A.—Yes.

Q.—That is, an estimated cost of survey plans and drawings so much plus professional fees so much?

A.—Yes.

Q.—Then the Government of Bombay pressed upon the Government of India the desirability that that should be done, and at the middle of page 6 you set out an extract as being one of interest, and I will read it: "The cost of the execution of a reclamation was first estimated by the officers of the Public Works Department, and the estimate thus obtained showed that the prospect of financial success was most promising. The Governor in Council felt, however, that complete reliance could not be placed on these figures, as no officer of the Department had practical experience of work of this highly special nature. Mr. Kidd, a partner in the firm of Messrs. Lowther Kidd, who possessed all the experience and knowledge required, and who was then in Bombay in connection with the extension of the Government Dockyard which was being carried out by his firm, was struck by the exceptional opportunity afforded by the stretch of rocky foreshore visible at low tide, and offered to make a preliminary investigation of a project for reclamation,

at his own expense." Then on page 7, at about the tenth line, there comes a very important passage which we shall have to discuss later: "In Mr. Porter's letter under reply"—that shows that Mr. Porter was the writer of the letter of the Government of India, does it not?

A.—Yes.

Q.—"It is stated that experience of reclamation by suction dredging is "limited" in Bombay. I am, therefore, to point out that the large reclamations being carried out by the Port Trust afford exceptionally complete data for estimating work of this kind." Then they refer to the fact that Mr. Kidd's figures were a sufficiently close approximation to the cost of the work to justify a further investigation of the scheme, and they clearly indicate that the scheme may be expected to be productive. "Mr. Kidd's figures may be accepted with safety as a sufficiently close approximation to the cost of the work to justify the further investigation of the scheme, and they clearly indicate that the scheme may be expected to be productive. Mr. Kidd's detailed estimates could not be supplied to the Government of India, as they are not officially in possession of the Government of Bombay, but an abstract estimate was so supplied. The Governor in Council has closely examined the figures and is convinced that they have been drawn up with due care and are sufficient for the immediate purpose in view, namely, to show that the reclamation scheme will be a reproductive public work and as such deserves detailed investigation." Then this letter, which is a very long one, continues. "An alternative method of procedure is to employ an expert for the investigation and the preparation of the estimates, and to call for tenders for the execution. This alternative did not commend itself to Government, because it would not provide so satisfactorily for their control of the work. Further, Government are well aware that economy in this class of work can be attained only by securing that the suction dredgers and other plant required shall be of the best design. The difficulties which have arisen with the Port Trust dredgers serve as a warning on this point. It is also necessary that most careful consideration should be given to the arrangements for carrying out the work and to the order in which it must be undertaken, and this is more properly the work of the contractor than of a consulting engineer." At page 9, on the 3rd August, 1912, Messrs. Lowther Kidd submitted their detailed report, did they not?

A.—Yes.

Q.—That was for the reclamation of 1,145 acres?

A.—Yes.

Q.—The report was accompanied by ten sheets of drawings, photographs, bills of quantity, schedules and actuary's report. A very large portion of the report (to which, of course, we will have to refer in detail later) was devoted to discussing the extent and character of the deposit in the harbour and the suction dredger machinery; and the first matter to which Mr. Kidd appears to have devoted his attention is Back Bay. He says: "Material for Filling. The first point to receive attention was the nature of the sea bed to the westward of the proposed reclamation." That is Back Bay, is it?

A.—Yes, that is Back Bay.

Q.—"As, obviously, if sufficient material of a suitable character could be obtained there, it possessed great advantages over any other possible source. This was quickly disposed of as the conditions are a very irregular rock bottom containing pockets or thin layers of loose sand in insufficient quantity within practicable distance and—for a great part of the year—a heavy ground-swell prevails which renders the work of dredgers dangerous, and frequently wholly impossible." Therefore, we have Mr. Kidd unequivocally condemning Back Bay as an area for dredging?

A.—Yes.

Q.—Then he deals with the question of the harbour: "The next source was clearly that part of the harbour bed adjacent to the western shore of the harbour and contiguous to the proposed reclamation. This, provided the material was suitable and available in sufficient quantity, presented conditions perfectly favourable in respect of sea exposure. Survey operations were consequently directed to ascertain the extent and character of the harbour bed over an area measuring 17,400 feet long by 9,000 feet wide. This was accomplished before the advent of the monsoon and conclusively established the existence of an extensive convenient area of mud and clay, yielding within the area prospected more than three times the quantity of material required for the scheme now proposed." Then he submitted drawing No. 5 and said "A system of boring by hydraulic tubes was devised which proved to be perfectly reliable as well as rapid in action"?

A.—Yes.

Q.—Then he refers to the character of the deposit, silt overlying a deep bed of blue clay. "For the purpose of filling and making up land the mud is sufficiently suitable." That is, the mud superimposed on the clay?

A.—Yes.

Q.—" And the clay eminently so." " The clay, which is stiff and unctuous, hardens into perfectly solid ground in a very short time. As far as possible in course of execution of the works the clay would be preferred, not only because of its greater suitability for making land, but also because for dredging purposes its stiffer and more tangible character enables a higher percentage of solid material to be transported by the pumps." " For making up land in the proposed reclamation the material has to be obtained from a greater depth and delivered to a greater distance than has hitherto been accomplished elsewhere." " As a result we have made provision for a very high class plant, and the working costs have been estimated accordingly. The machinery we would employ will be designed and guaranteed to effect the removal of 2,000 cubic yards of silt or blue clay per hour from a maximum depth of 70 feet below low water." I am only making passing references to this, but might I ask you this? Is there anything in Mr. Kidd's report which throws the least doubt on the feasibility of the scheme?

A.—No, I do not think there is anything in Mr. Kidd's report which throws any doubt whatever on it.

Q.—And whilst asserting the existence in sufficient quantity of dredgable material, he adds a phrase which may have attracted your attention—that is, the phrase on Page 10 which you set out " A system of boring by hydraulic tubes was devised which proved to be perfectly reliable as well as rapid in action." Did it strike you there that he was talking about something which at first at all events had been in the nature of an experiment?

A.—All he wanted to know was where the hard material came to.

Q.—That is not an answer to my question. My question was this. When you saw that passage " A system of boring by hydraulic tubes was devised, &c.," did not that rather suggest that Mr. Kidd was embarking on something in the nature of an experiment?

A.—If you take it in that way, yes.

Q.—I am asking you how it struck you. Did that passage strike you at all that Mr. Kidd was possibly embarking on an experiment?

A.—Knowing how it was done, I should not have called it an experiment.

Q.—Did it occur to you that it might be prudent to take a few check borings to see whether Mr. Kidd was right in his views?

A.—No. I considered that Mr. Kidd's borings were ample; in fact, I had never seen a scheme with greater detailed information in respect of the material. I was quite satisfied with it, and I am still quite satisfied with it.

Q.—Was your own report, dated September, 1919, brought over to India by you or sent through the post?

A.—I took it with me to India.

Q.—You took it with you to India and presented it to the Government. In your report you do undoubtedly assert your confidence in Mr. Kidd's borings?

A.—Yes.

Q.—But you yourself of course had no personal knowledge of the character of the sea bed in the harbour?

A.—I would not say that, because I had a very general knowledge of the sea bed.

Q.—I will come to it a little later, but I think you have said that you had no personal knowledge of the character of the sea bed. You had never taken any borings?

A.—I had never taken any borings.

Q.—Beyond what Mr. Kidd put in his report, had you any information at all?

A.—Yes. I had studied the Sewri reclamation.

Q.—How had you studied that—what documents or what people?

A.—I discussed it frequently with the late Chief Engineer to the Port Trust.

Q.—Is that Mr. Messent?

A.—Yes.

Q.—Did Mr. Messent ever give you any figure of the performances of the " Kalu " and " Jinga "?

A.—No, I do not think he did. I do not remember any detailed figures.

Q.—The " Kalu " and " Jinga " had been working, had they not, from 1908 to 1913 in the Sewri reclamation?

A.—Yes.

Q.—Did you consider that the nature of the sea bed in the Sewri area was the same as that in the harbour?

A.—I always understood it was the same, yes.

Q.—From whom did you understand it?

A.—I discussed it frequently with Mr. Messent. I went over the Sewri reclamation works. I was constantly down there.

Q.—When did you go over the Sewri reclamation works?

A.—I must have gone over them several times. I was several times in Bombay between 1901 and 1924. I always knew what was going on. Mr. Messent was a very old friend of mine.

Q.—I am asking about Sewri for the moment, because, you see, the evidence up to now has really all been one way. It may be wrong, but it has been all one way, namely, that the character of the deposit in the Sewri Mazagon reclamation is all mud, very little clay and no rock, and that the material in the harbour is of quite a different character altogether?

A.—I do not agree.

Q.—So be it. In fact, if it had occurred to you advisable that check borings should be taken, they could have been taken when you handed in your report in November, and for three or four months after that, could they not?

A.—Yes.

Q.—From November you get for some months a complete certainty of calm weather?

A.—Yes.

Q.—And within a week or ten days check borings could have been made?

A.—They could. I did not think it was necessary.

Q.—I see your point, but I am asking you whether they could have been made? You were there from November, 1919, when you handed in your report, for how long—two or three months?

A.—I arrived in Bombay on the 19th May and I left Bombay on the 31st May.

Q.—I have jumped for the moment to November 1919. You will probably be able to tell me from your recollection. It was in November 1919 that you handed in your report?

A.—Yes.

Q.—How long did you stay there after handing in your report?

A.—I should think three months.

Q.—I am not pinning you down?

A.—Something like two or three months.

Q.—In that two or three months you could have arrived with certainty at the nature of the sea bed, could you not?

A.—I considered I knew it absolutely.

Q.—I follow that.

A.—I could have done it, yes.

Q.—I see your point, but still you could in fact have arrived at it with certainty by December of 1919?

A.—Yes.

Q.—Now I go back to your statement on page 12: " On the 7th August, 1912, the Bombay Government forwarded for the consideration of the Government of India Messrs. Lowther & Kidd's report and observed that the drawings might be considered as complete working drawings, which would give sufficient information for examination of the designs and for the immediate commencement of the work; the investigation had been most carefully made and might be accepted as exhaustive. The report was clear and complete all doubtful points had been settled, and the revised estimate might be accepted as completely trustworthy and ample. It was further stated that in presenting this project to the Government of India the writer was to say that his Excellency had the fullest confidence in the ability and expert knowledge of Mr. Kidd who had worked it out in detail; but in case it should be desired to obtain further expert opinion he was to suggest the names of Mr. A. W. Robinson, Montreal, who was prabably the greatest living expert in the world on reclamation by suction dredging, and who was consulted as such by the Egyptian Government, and of Mr. C. S. Meik, the eminent consulting engineer of 16, Victoria Street London, whose opinion on sea protection work might be accepted with confidence."

So Mr. Robinson is being put forward as the greatest living authority on suction dredging?

A.—Yes.

Q.—And Mr. Meik, who at a very early date after this became partner with you, is put forward as a great authority on sea protection work?

A.—Yes.

Q.—" The letter concluded that it was the earnest desire of His Excellency the Governor in Council that this project should receive the serious consideration of Government as highly productive work, an early prosecution of which was necessary for the growth and prosperity of the City of Bombay, and that it might be recommended for acceptance by the Secretary of State."

A.—I would like to emphasize that the letter from the Bombay Government says " The investigation had been most carefully made and might be accepted as exhaustive. The report was clear and complete, all doubtful points had been settled, and the revised estimate might be accepted as completely trustworthy and ample " I think that is worthy of emphasis.

Q.—I did read it, but you are quite at liberty to emphasize it, and I am glad you have done so. It is a matter we have to consider. That revised estimate was 325·61 lakhs, was it not?

A.—Yes.

Q.—And the Government of Bombay was pinning its faith and pledging itself as decisively as a Government could to the propriety of that estimate?

A.—Yes.

Q.—Then you say " The decision of the Government of India on the letter from Bombay was to postpone consideration of the scheme," which is a habit which Governments have, is it not?

A.—Yes.

Q.—" But to appoint a strong, fully representative committee to consider the general question of the future development of Bombay city."

A.—Yes.

Q.—That is rather an important moment. You see, up till now right from 1863 onwards, nothing had been discussed except the reclamation of Back Bay and just the 127 acres in Colaba. Now we get the Government of India coupling with that the general question of the future development of Bombay City?

A.—Yes.

Q.—If, as a result of the deliberations of this committee, it should be decided that the reclamation of Back Bay was desirable, a beginning would be made by following the suggestion of Messrs. Lowther and Kidd; that is, to first take in hand the reclamation of an area of 84 acres, the cost of which was estimated at 37 lakhs." Messrs. Lowther and Kidd had suggested, had they not, that there could be an alternative reclamation of a small strip of 84 acres?

A.—Yes.

Q.—And they put the cost of that at 37 lakhs. It was on that that the Government of India fastened, and said: " Well, if the committee recommend, begin on that small area." Up to this point, is it putting it correctly, in your opinion, to say that the attitude of the Government of Bombay throughout was that of a Government very desirous of having the reclamation?

A.—Undoubtedly.

Q.—And the attitude of the Government of India very cautious?

A.—Yes.

Q.—In 1916, that is five years later than Mr. Kidd's report, the late Mr. Russell was then Secretary to the Government of India in the P.W.D., and he recorded these views in March, 1916. You set them out, but the point I wish to emphasise is on page 16 : " Generally, however, the estimate seems to have been prepared with great care, and probably contemplates this." That is that certain material would settle. "Altogether in its technical aspect the work appears to be quite feasible, and presents no insuperable difficulties with every likelihood, as far as can be judged, of being carried out at its estimated cost of Rs. 325 lakhs."

A.—Yes.

Q.—That, therefore, is the considered opinion of Mr. Russell, the Secretary to the Government of India in the P.W.D., approving Mr. Kidd's plans as regards feasibility and approving the estimate? That is right, is it not?

A.—Yes.

Q.—" The sufficiency of material has now been finally settled." You would like that point emphasized?

A.—Yes.

Q.—" And the closeness of the three estimates, namely 6·7, 5·8, and 5·86 per square yard of gross area reclaimed, coupled with the fact that a reliable firm of engineers is ready to execute work at the last-mentioned rate may be taken as indicating that the estimate under consideration is probably as reliable as can be expected." So that, in its broad details, Mr. Kidd's scheme had also the approval of the Secretary of the P.W.D. of the Government of India?

A.—Yes.

Q.—Down to the bottom of page 16 is there any other matter in Mr. Russell's memorandum that you would like me to mention or to discuss with you?

A.—I take it that I shall have an opportunity later on of going into greater detail?

Q.—We must do so, of course. I should like you to understand that I am now trying to get all the introductory matter quite clear. After that, of course, we shall have to go straight through the various facts. I am now just prefacing this, so that people may understand exactly what was, according to your statement, the position of the Government of Bombay in relation to the scheme, the position of the Government of India, the position of Messrs. Lowther and Kidd, and all the people who took a prominent part in it.

A.—Quite so. I do not think there is anything which I particularly want to emphasize in this. I might say, with reference to page 15, that Mr. Kidd's project was supposed to be a complete working project.

Q.—Undoubtedly. I read that at the bottom of the page.

A.—I would also like to draw attention to the fact that Mr. Russell's remarks, at the top of page 15, " Without a great deal more detailed information as to the number, cost, and capacity of the dredgers, length of pipe-line, necessity or otherwise of a short delivery line, it is impossiblle to criticise the rate."

Q.—Yes, but it goes on to say, " but I should say that the rate of Rs. 23 should be ample ".

A.—Yes.

Q.—I had better read the whole of your paragraph 16, I think. " In November, 1912, the Government of Bombay appointed a Committee of prominent and representative citizens to investigate the financial features of the scheme, and to answer a series of questions dealing with the need for reclamation, the probable demand for building sites, the effect upon the value of existing landed property in Bombay, and other important matters. This Committee reported on the 22nd January, 1913, and concluded their remarks by saying that they wished to lay stress on the fact that the scheme was not only financially sound, but that it would add to the beauty of the City, and after some years would add considerably to the resources at the disposal of the Improvement Trust in its efforts to reclaim insanitary areas." So there, again, we find the reclamation of Back Bay linked up with the housing problem?

A.—Yes.

Q.—Then the Government of Bombay, on the 11th March, 1913, returned to the attack, and wrote to the Government of India pressing that sanction should be given to the work, and you say, " The Government of India, however, was still unconvinced and expressed the opinion that a strong representative Committee should be invoked to consider the future development of Bombay City in all its bearings, and expressed the view that if the Committee were in favour of the Back Bay scheme, a beginning should be made with a strip of land measuring 84 acres." Do you mind turning back. Is that the same Committee about which we were talking a few minutes ago at the bottom of page 13? Is this a repetition of the bottom of page 13?

A.—No, I think that is a new Committee.

Q.—That Committee, again, had their attention called to the 84 acre scheme of Mr. Kidd?

A.—There had been very many committees.

Q.—Then you say " The Bombay Development Committee was accordingly appointed by Government of Bombay resolutions dated October and November, 1913, and their report was issued in April, 1914. This report contained no specific recommendation to undertake reclamation in Back Bay on a large scale but suggested that an area of 100 acres should be reclaimed in order to provide accommodation for certain urgently required public buildings." Then, in the next two or three years, there were several schemes. The matter was not allowed to rest at all, and on the 15th September, 1916 the Government of Bombay pressed the Government of India to allow them to reclaim 220 acres, did they not?

A.—Yes.

Q.—Then the Government of India said " No, that is not in accordance with the decision arrived at in 1913 "; and they said they could only consider a much more modest scheme and only entertain it if the Government of Bombay could show that it could be financed out of provincial resources. Is that how it stood?

A.—Yes, that is how it stood.

Q.—That is the history up to the end of 1916. Then we come to the very important date of December 1917. In December 1917, did a group of Bombay gentlemen interest themselves in this question of the reclamation?

A.—Yes.

Q.—Were they Sir Sassoon David, Sir Shapurji Broacha, Sir Fazalbhoy Currimbhoy, Sir Vithaldas Thakersey and Sir Lallubhai Samaldas? That was the first syndicate?

A.—Yes.

Q.—I do not know, Sir George, whether you are in a position to tell us whether those gentlemen were very influential and prominent citizens of Bombay?

A.—I am not in a position to say so as a matter of fact, but it was generally understood that they were.

Q.—It rather sounds like it, does it not?

A.—Yes.

Q.—And not only prominent citizens, but very enterprising and very hard-headed citizens?

A.—Yes.

Q.—And they proposed to carry out the Kidd scheme for the reclamation of the 1,145 acres, did they not?

A.—Yes.

Q.—What they wanted was a concession, and they assured Government that all the necessary capital could be provided?

A.—Yes.

Q.—In the same month did Messrs. Tata Sons, Limited, also come to the front?

A.—Yes.

Q.—Did they want to have an option to consider whether they would undertake the development also?

A.—Yes.

Q.—Neither the first group nor Messrs. Tata Sons, Limited, were, I suppose, doing this for philanthropy, were they?

A.—No. I do not think it was ever suggested they were philanthropists.

Q.—There may have been a certain sentiment about the improvement of Bombay, but it is obvious from what you put in your statement, and from the evidence which we have had, that they were of opinion that there was money in it?

A —Undoubtedly.

Q.—And that the reclamation could be done according to Mr. Kidd's estimate, and that the result would be a profit to whoever undertook it? That is right, is it not?

A.—I do not think they ever gave any guarantee that they thought it could be done according to Mr. Kidd's estimate. They were not carrying out Mr. Kidd's scheme. They said that if the option were granted to them they would at once engage the requisite engineering staff to prepare a scheme of their own. I do not think they were contemplating following Mr. Kidd.

Q.—Will you look at page 18 of your own statement—" and they said that they intended to carry out the work according to the intended programme of Messrs. Lowther, Kidd & Co."

A.—Yes, the intended programme. I did not mean that they were going to pick Mr Kidd's scheme.

Q.—They were not going to be slavishly bound, but they were going to reclaim an area of 1,145 acres by suction dredging, presumably, and they believed that they could make it pay?

A.—Yes.

Q.—That they would not only reclaim the land, but would make it pay?

A.—Yes, and that if they were given the option they would at once engage the requisite engineering staff to prepare a scheme.

Q.—Then the opposing groups combined into one, did they not?

A.—Yes.

Q.—And the matter was discussed with Sir George Carmichael. At this time Lord Willingdon was the Governor, was he not?

A.—Yes.

Q.—He had, in January, 1918, about 11 months to remain in office before the arrival of the new Governor?

A.—Yes.

Q.—Was the effect of the discussions with Sir George Carmichael, with the Sassoon David and the Tata group that Government resolved to have a report by an independent engineer?

A.—Yes.

Q.—Before they had come to that decision, were Messrs. Lowther and Kidd themselves anxious to do the work as agents for Government?

A.—They were.

Q.—We need not take this in great detail, but they had been pressing from 1914 for Government to entrust the work to them?

A.—They had.

Q.—It is only business?
A.—Yes.

Q.—Mr. Kidd, I think, had left the firm of Lowther & Kidd and had joined the firm of Messrs. Armstrong, Whitworth & Co.?
A.—Yes.

Q.—And later Messrs. Armstrong, Whitworth & Co. were not indisposed to do certain reclamation work?
A.—They sent in a definite proposal.

Q.—On page 24 you set out a letter of the 9th December, 1918, signed by the Secretary to the Government of Bombay Public Works Department, addressed to the Government of India, saying " that the Bombay Government had always recognised that before the estimates prepared by Messrs. Lowther & Kidd in 1912 could be adopted, it would be necessary to have them scrutinised by an independent expert on the spot; for these reasons they desired to have the scheme examined by the best expert whose services could be secured. His report would enable them to calculate with greater approximation what the value of the concession was likely to be. The expert, said the letter, should be one who had experience in harbour and reclamation, and the knowledge of recent developments of dredging and pumping appliances." Then it deals with the fee.

A.—I would just like to point out to you, Mr. Chairman, that I say in paragraph 26, on page 24, that the Joint Secretary to the Government of Bombay addressed a letter to the Government of India——

Q.—I will ask you to wait for a moment. I have read you the letter of the 9th December, 1918. I prefer to get the story in chronological order. I will come back to that letter. For the moment let us consider the letter of the 9th December, 1918, in which the Government of Bombay were asking for the services of the best expert who could be secured. Then, on the 24th January, 1919, some six weeks later, Sir W. G. Armstrong, Whitworth & Company, Limited, were offering to do some work, as " they observed that in connection with the scheme they desired to emphasise " —this is the point you want, is it not?—" that by far the most important item governing the ultimate total cost was that of dredging, which arose from the fact that in no part of the world had any similar work been executed under anything like the same conditions as to depth from which material had to be obtained combined with distance to which it had to be delivered."

A.—Yes. What I wanted to point out was that the Government of Bombay were hardly consistent in their letter of the 9th December, 1918, in saying that before the estimates prepared by Messrs. Lowther & Kidd could be adopted it would be necessary to have them scrutinised by an independent expert, because in their letter of the 7th August, 1912, they said " that the drawings might be considered as complete working drawings, which would give sufficient information for examination of the designs and for the immediate commencement of the work; the investigation had been most carefully made and might be accepted as exhaustive. The report was clear and complete, all doubtful points had been settled." I say that that letter is inconsistent with the letter dated 9th December, 1918.

Q.—In December, 1918, the gentleman who was Joint Secretary (and it is the Joint Secretary who is writing) would not be Joint Secretary in 1912?
A.—No, they were different personalities.

Q.—You do not object to the letter of the 9th December, 1918, do you, asking for the best expert whose services could be secured; because it was by that means that you came to do the work.
A.—No, I do not object.

Q.—Now we come to an important date. The letter which I have just read of the 9th December, 1918, was written at the time when Lord Willingdon was on the eve of leaving Bombay?
A.—Yes.

Q.—And on the 25th January, 1919, which is the next date you mention, Lord Lloyd had arrived as Governor?
A.—Yes.

Q.—At the bottom of page 24 you say " On the 25th January, 1919 (by which date Lord Willingdon had been succeeded at Bombay by Sir George Lloyd) the Secretary of State for India asked the Government of India by telegraph whether the latter agreed with the Government of Bombay that the expert to be selected should be an independent person," and then he dealt with those matters which had been under discussion with Messrs. Lowther & Kidd. Then on the 5th March, 1919, the Government of India gave a history of the scheme, and stated that it was in agreement with the Government of Bombay that, with a view to a settlement of this long outstanding question, the project

should be examined by the best expert available so that an authoritative opinion on the scheme might be obtained, and the closest possible estimate of cost be framed. Then you quote, " The expert selected, the Government of India thought, should be one who had large experience on harbour and reclamation works, and knowledge of the most recent dredging and pumping appliances, and, as suggested by the Government of Bombay, should be entirely independent of any of the firms that had applied, or were likely to apply for the concession." Then we come to the telegram of the 8th April, 1919. The Governor of Bombay sent this telegram to the Secretary of State. It has been read more than once, but I must just give a summary of it to make the story intelligible. The Government of Bombay say, " Back Bay Reclamation Scheme: Government of India has asked you to send out best expert available to examine and make final report on above. Government of India has also asked us to send all plans to Delhi for transmission to you in order that expert may study them before departure. (1) I think this procedure involves unnecessary delay," that is, the sending of plans. This appears to be a personal telegram from Lord Lloyd, does it not? It says " I " think. " I have consulted the Government of India and Sir Claude Hill concurs in proposing you should send expert out at once to arrive Bombay not later than the third week of May." Then it is suggested that certain persons could advise regarding choice of experts, and now comes the mention of your name for the first time: " Failing your ability to find expert in short time available my Government would agree to using Sir George Buchanan, whose services would probably be available and whom the Government of India recommend. (6) My telegram has been drafted in consultation with the Government of India and is being communicated to them. (7) Please telegraph immediately whether expert can be found in time to arrive by middle of May, or whether we should proceed with Buchanan." Lord Lloyd's attention was called to that telegram, but he was not able to tell us who it was made the recommendation or in what manner the recommendation had been made. Do you happen to know at all?

A.—No; I do not think I can enlighten you on that point.

Q.—It does not matter; it is immaterial. On the 7th May, 1919, you got a telegram. You are then at Simla?

A.—I was then a member of the Government of India Munitions Board.

Q.—But you were at Simla?

A.—Yes.

Q.—" My Government are desirous of securing your services at once to examine and report upon the Back Bay reclamation scheme. All plans and data are here, but it would involve your being in Bombay before the break of the monsoon, and for as long afterwards as you found necessary for the preparation of your report. Please telegraph informing me whether you will undertake the work, and in a following letter suggest terms." That is a telegram from Sir George Lloyd to yourself?

A.—Yes.

Q.—Then you say: " The foregoing brings the history of the case up to May, 1919. I have gone into the matter in some detail in order to show that so far from the scheme being prepared in secrecy and forced upon an unwilling people by an arbitrary Government every possible opportunity for years had been given for free discussion, and that no less than 18 different projects had been discussed."

A.—Yes.

Q.—" The Government of India certainly showed no disposition to rush the matter, and in a letter from Mr. Montagu, then Secretary of State for India, to the Viceroy, dated 7th November, 1918, occurred the following paragraph: ' I still feel a little anxious about the Back Bay reclamation scheme in Bombay. My views are that it should be put forward as a valuable contribution to the housing difficulty in Bombay, but my views are very strongly, on the evidence before me, that if it is undertaken it should be undertaken as a Government enterprise and not given to any concessionaires.' "

A.—Yes.

Q.—To try and locate that letter, that letter was just 12 months after the Sassoon-David syndicate and the Tata syndicate had revived the matter by asking for a concession?

A.—Yes.

Q.—That must obviously have been known to Mr. Montagu, and must have been in his mind?

A.—Yes.

Q.—As to whether, amongst other things, the matter should be undertaken as a Government enterprise or be handed over to some concessionaire?

A.—Yes.

Q.—Then on page 27, paragraph 31, you say: " When I received the telegram already quoted from Lord Lloyd I was a member of the Government of India Munitions

Board; but the War was over and I was on the point of terminating my duties with the Munitions Board, so I telegraphed my acceptance of the offer." You telegraphed your acceptance, and then you say: "In a letter from Simla dated the 12th May to Sir George Lloyd I made the following remarks: 'The work is of a kind with which I am familiar, as I designed and carried out the very large river training and land reclamation scheme on the Rangoon River, while I was also responsible for initiating all the reclamation works at Basra which have transformed the river front on the Shatt-al-Arab.'" Had you up to this time any previous personal experience of reclamation on an open sea front?

A.—I do not quite understand you.

Q.—What do you not understand? Had you up to this date, 1919, any previous practical experience of reclamation upon an open sea front?

A.—If you put it in that way I say, No; but I should like to say something about that later.

Q.—In the letter you say you carried out a very large river training scheme. "River training" means, does it not, directing the river into some desired channel?

A.—Yes.

Q.—That was at Rangoon. I think the result of that work, taking it shortly, was that it was completed by you in 1913, and in 1916, three years later, Sir Harvey Adamson spoke in terms of the highest appreciation of your work in Rangoon?

A.—Yes.

Q.—And you received the honour of knighthood for that work. Then in 1916 you were employed in Mesopotamia and, as you say, initiated all the reclamation works at Basra which have transformed the river front of the Shatt-al-Arab. In 1917 you received the K.C.I.E.?

A.—Yes.

Q.—Now, continuing the letter, on page 28, you quote: "I have seen Sir Thomas Holland to-day, and I have arranged to leave Simla for Bombay on the 17th instant. I have at present only a superficial knowledge of the Back Bay scheme, but I assume that plans, cross-sections and borings are available (as there would certainly not be time to have these prepared before the monsoon) and that the reclamation is proposed to be effected by dredging outside a retaining wall marking the limit of reclamation and depositing inside the wall. In that case, one of the principal problems would be to decide on the best type of dredger, and whether at the present greatly enhanced price of these machines the scheme would be practicable from the financial point of view." You will not mind my suggesting that you could hardly have given more excellent advice? At that moment the thing which had to be considered was the best type of dredger, if you were going to rely on dredging, was it not?

A.—Yes.

Q.—Secondly, it would be your duty to consider whether you could advise the Government of Bombay to carry on the scheme in view of the enhanced prices of dredgers, boosters, pipe lines, and everything of that character?

A.—Yes.

Q.—Therefore, you must have had it in your mind when you wrote the letter that it was possible that the cost of the machines might be prohibitive, and that you would have to advise the Government not to carry out the scheme?

A.—Yes.

Q.—I think you arrived in Bombay on the 19th May, 1919, and saw Sir George Curtis; and on the 21st May you received a letter from the Governor, Sir George Lloyd, saying he was glad you had consented to undertake the Back Bay scheme, and that he thought the whole scheme depended upon the mammoth dredger, its cost, and when it could be sent out, and that he believed this was the biggest dredging scheme ever contemplated, and as such would, he was sure, interest you?

A.—Yes.

Q.—Then on the 23rd May, two days later, you wrote to Sir George Lloyd saying you had gone through all the plans and papers and had been able to form an idea of the work required, and as far as the sea wall was concerned there was no engineering difficulty: "But, as I thought would be the case, the crux of the whole scheme lay in the provision and successful working of the dredger or dredgers, and that under those circumstances the sooner I get home to tackle the dredging problem with builders of dredging plant the sooner I shall be able to decide on the best action to take." Therefore, you suggested you should go home on the 31st May?

A.—Yes.

Q.—Will you just look at the passage: "The crux of the whole scheme lay in the provision and successful working of the dredgers or dredgers"?

A.—Yes.

Q.—Was not really the first thing that had to be ascertained with certainty that you had in the harbour a material of a depth and character suitable for dredging?

A.—Yes; and I was quite satisfied.

Q.—I am putting it to you that that would be the first thing to ascertain, obviously?

A.—Yes.

Q.—If no material, no dredging proposition?

A.—Obviously.

Q.—If it should happen that although there was the material it proved to be unsuitable for the dredger, naturally the scheme would fail either wholly or in part?

A.—Yes.

Q.—We are now in May of 1919, but even as late as February of 1922, three years later, after the dredger had been ordered, were you saying: "Much depends on the nature of the matrial dredged, and that can only be definitely ascertained when actual dredging begins?"

A.—That is so; but I take it I shall have an opportunity of explaining that letter later.

Q.—Certainly.

A.—We need not go into details at the present moment. I accept that.

Q.—I am coming back to that. Would you take a copy of your reports, as we might just follow this through. Have you seen that little book before? (*Small book handed to the Witness.*)

A.—No; I have not seen it.

Q.—They are your reports on your visits to Bombay in connection with the Back Bay Reclamation Scheme. I suppose you have a copy of your report of the 11th February, 1922?

A.—I have.

Q.—These have been provided for official use. I assume them to be correct, but if they are not correct you will point out anything which is wrong. I will just take you through the various references as to the quality of the material that occur in this book, and then I would like, and I am sure the Committee would like, you to give us your explanations.

A.—These are my annual reports?

Q.—Yes. Would you turn to page 8 of that? I am just going to give you the references and then I will ask you a question on them. You say on page 8: "Much depends on the nature of material dredged, and that can only be definitely ascertained when actual dredging begins"?

A.—Yes.

Q.—I will just tell you what my suggestion is. My suggestion is, if that was your state of mind in 1922 it must also have been your state of mind in 1919, must it not?

A.—No; I do not agree.

Q.—Why not?

A.—I can explain that; but it was not my state of mind in 1919.

Q.—What had happened then?

A.—I would like to go into the question of clays, but were there any other references you desire to make?

Q.—Yes; a great number of them. Will you turn to page 12: "Wall construction will be easier and speedier than I anticipated, and the only uncertainty concerns the exact nature of the material to be dredged from the harbour and used as filling"?

A.—Yes.

Q.—That is the 11th February, 1922?

A.—Yes.

Q.—By that time the dredger was ordered, and more than £350,000 worth of plant independently?

A.—Yes.

Q.—Taking the dredger and plant up to this date, the cost was somewhere in the neighbourhood of £655,000?

A.—Yes.

Q.—I will just take you to another reference on page 25: "It has always been realised that the successful reclamation of the area enclosed, by pumping through pipelines material dredged from the sea bed, is the crux of the whole scheme." Then on page 29, paragraph 6, there is this: "In May, 1921, the Chief Engineer in letters to us raised the question as to the suitability of the material in the harbour for reclamation purposes; he said it had been very unfavourably reported on by experts, and he discussed the possibility of obtaining more suitable material in Back Bay. In our

letters dated the 22nd June and 2nd July, 1921, we quoted the specific statements on the subject made by Mr. Kidd in his report dated 3rd August, 1912, and said that we were unable to accept, without much more information, the pessimistic report as to the unsuitability of the material in the harbour and that it was impossible to come to any conclusion until a dredger had been actually at work for some time on the spot?

A.—Yes.

Q.—Having handed in your report in October, 1919, a dredger on the spot could have reduced this uncertain factor to absolute certainty, could it not, between October and December?

A.—There has never been any uncertainty in my mind as to the suitability of the material for dredging. May I read some notes I have made on that point?

Q.—Shall we just finish this, and then you can read the note, but probably you would like to see the whole of these references to which I wish to direct your attention. The next is on page 30, that is in November, 1922: "I again visited Bombay and was accompanied by Mr. W. T. Halcrow (now a member of my firm). The Chief Engineer had been proceeding with his investigations in Back Bay since my last visit, and on the 8th December, 1922, I convened a conference on the subject of dredging, at which were present the Chief Engineer (Mr. Lewis), Mr. Halcrow, Mr. McMurray, of Messrs. Simons & Co., and myself. During the conference the Chief Engineer again expressed his fears about the suitability of the material in the harbour for reclamation purposes and proposed to abandon the harbour and reclaim the whole area from Back Bay." At one time during that conference did you agree that if sufficient first-class material could be obtained from Back Bay it would be better to use it than the mud and clay in the harbour?

A.—I do not think I ever agreed to use the material from Back Bay. I do not think I ever made an unqualified agreement. The use of the material from Back Bay was not initiated by me, and I do not remember an unqualified agreement.

Q.—I have a memorandum signed by yourself dated Bombay, 16th December, 1922, and it is clearly the memorandum on which you are basing this report, and it says: "The general question of dredging was discussed." Up to this time had there been no dredging at all?

A.—No.

Q.—The dredger had arrived in March, 1922, and was laid up?

A.—Yes.

Q.—This is your own note: "It was agreed that if sufficient first-class material could be obtained from Back Bay without undue risk to the pipe-lines and dredgers, it would be better to use it rather than the mud and clay from the harbour." That was a complete reversal of the scheme, if it had been embarked on, was it not?

A.—Yes.

Q.—Originally your plan was that the "Sir George Lloyd" would go into the harbour?

A.—Yes.

Q.—She would have a pipe-line up to 5,000 feet if necessary?

A.—Yes.

Q.—She would dredge the harbour bottom down to 70 feet if necessary?

A.—Yes.

Q.—And she would pump the material through her 5,000 feet of pipe-line?

A.—Yes.

Q.—Where it would be picked up by the booster, the "Colaba," and pumped along either 5,000 feet or a less number of feet on to the proposed reclamation?

A.—Yes. What was the page in this little book where your last quotation was from?

Q.—I am reading now from a big volume entitled, "The Back Bay Reclamation Scheme," page 65. I am reading from the volume of correspondence. It is the memorandum of the 16th December, 1922, signed by yourself, of a meeting in the Chief Engineer's office. Paragraph 3 says this: "The general question of dredging was discussed. It was agreed that if sufficient first-class material could be obtained from Back Bay without undue risk to the pipe-lines and dredgers, it would be better to use it rather than the mud and clay from the harbour. There was, however, no indication at present that large quantities could be obtained from Back Bay, and therefore the plan must be proceeded with to use the harbour material. Mr. Halcrow suggested the dredger 'Sir George Lloyd' be commissioned and the first pipe-line laid, but only a small area now practically ready at the 'Colaba' end of the reclamation: The plant would be ready in three months and leave two months for experimental pumping." "Experimental pumping" means not merely getting the crew into condition, but it means experimenting as regards the nature of the material that you would be dealing with, does it not?

A.—No.

Q.—Surely it must. Look at the few lines above? The proposal before you was to go into Back Bay and have nothing to do with the harbour?

A.—Yes.

Q.—The reason was that the material in the harbour had been unfavourably reported on?

A.—Yes.

Q.—Mr. Halcrow then says: " Well, get the ' Lloyd ' into commission, and have two months' experimental pumping?

A.—Yes.

Q.—Was not that to find out what sort of stuff you would pump?

A.—It was not to find out whether the dredger could pump the material.

Q.—Was not it to find out the kind of material which constituted the bed of the sea?

A.—Well, yes, taking it in that way, I suppose it was.

Q.—There had been a statement made by Mr. Lewis that a Mr. Mitchell had reported very unfavourably on the stuff in the harbour?

A.—Yes.

Q.—One of the purposes of this meeting of December, 1922, was to discuss what was to be done about the dredging?

A.—Yes.

Q.—Mr. Halcrow put forward the suggestion that the ' Lloyd ' should be commissioned, and you should try to find out in two months what the material really consisted of. " This was considered to be pressing things too much, and Sir Lawless Hepper again asked Mr. Lewis if he could not fix up his barge with a crane and grab which were dismantled some weeks ago to make tests, as Mr. McMurray had received information that the new grab dredger was not likely to arrive before April. Mr. Lewis promised to see what could be done, but did not think he could grab deeper than 15 feet deep in the sea bed. This, however, would give samples of the least suitable material." Anyhow, is it fair to say that in December, 1922, neither you nor Mr. Halcrow, nor Mr. Lewis, nor Sir Lawless Hepper, nor anyone was able to say what was the nature of the sea bed which it was proposed to dredge?

A.—No, I would not say that at all. I should say that we knew the nature of the material, but we did not know how it would dry out. May I explain a little about this phrase " stiff and unctuous clay "?

Q.—I will just finish this. You will have every opportunity at any time you want to make any statement you please. We want all the help you can give us.

A.—My point is there is a complete misunderstanding between us on the subject of the material in the harbour.

Q.—Then page 32 of this little book contains another reference in your reports. I am just giving you the references to the various mentions of material in your reports: " It was an agreeable surprise to see that what was being pumped consisted largely of a hard, compact clay with which we had reason to be quite satisfied "?

A.—Yes. As a matter of fact later on we were not satisfied with it, but that is another point.

Q.—True. Then the next passage is at page 37: " The ' Sir George Lloyd ' and ' Colaba ' were designed to discharge 2,000 cubic yards of soft clay per hour through 10,000 feet of 42-inch pipes. Last season the material actually dealt with was not soft clay, but silt and stiff clay, with some sand and stones "?

A.—Yes.

Q.—Does not that point to the fact that you met material of an unexpected character?

A.—No. In the light of experience we ascertained that the dredger was dredging too deep. She ought not to have gone down where she was.

Q.—" Which, although much better than soft clay from the point of view of suitable material for reclamation, is heavier and more difficult to pass through the pipe-line "?

A.—Yes.

Q.—" Until considerably more work has been done, it is impossible to say of what the bulk of the material to be dredged would consist." That was in 1924?

A.—Yes.

Q.—Is not that a definite statement that even then it was impossible for you to say what the bulk of the material to be dredged would consist of?

A.—No; we knew that the material was soft silt, and what is known as stiff unctuous clay, but we did not know how much soft clay we would get or how much stiff unctuous clay. We knew that we should get ample material, either soft clay or stiff unctuous clay. We knew that we should not have to dig down into the hard stones and clay. A

large portion of the area that Mr. Kidd had proposed, where there was more stiff unctuous clay than silt, had been taken away from us, and we did not know how much stiff, unctuous clay we were going to get, or how much soft silt. Mr. Kidd in his report had said either the silt or the clay is suitable for reclamation purposes, but that the clay was better than the silt. Very well then. We found we could not get as much of the clay as of the silt. The whole discussion was with reference to the quality of the silt for making land, not in any way connected with the capacity of the dredger for dredging it. Shall I now read my notes?

Q.—Let me just finish this passage. You say: " Until considerably more work has been done it is impossible to say of what the bulk of the material to be dredged will consist "?

A.—Yes.

Q.—That is your report?

A.—Yes.

Q.—" But I think it is safe to assume that we shall not get to the full output of 2,000 cubic yards per hour, and that fact must be faced. If we get two -thirds of the estimated total output, we shall be doing well; but naturally the time required to complete the work, and the cost of the pumping, will be increased "?

A.—Yes; that was at a certain date; but in the light of experience we do not say that now. In the light of experience we shall neglect this. We say: Do not go digging away in this heavy stuff. It makes a very good filling but you can get any amount of filling higher up without going down into the clay and sand and stones.

Q.—Where have you ever said that? I do not recognise that as having been said in any instructions which you sent?

A.—Yes; we have repeated the instruction latterly. This was about the very beginning of the dredging operations. I was only in Bombay during two dredging seasons, and then only for a short time, but we have considerably more experience now than we had then. Our latest instructions to people in charge of the dredgers was that they were not to go ignorantly and stupidly digging into the hard ground. We said if they got into the hard ground—and, of course, we know that there is hard ground below the stiff unctuous clay, they should at once lift the ladder and go anywhere round about where there are millions of yards of suitable material. Our point now is in the light of experience there is all the material—in fact, the material is ideal—for filling the reclamation and the dredger is suitable. We are satisfied on these two points: (1) that the dredger can dredge the material; (2) there is the material. That is in the light of our experience to-day.

Q.—Can she dredge the material at a uniform rate of 2,000 cubic yards per hour?

A.—Well, I have not been out there recently.

Q.—What is your opinion?

A.—I should say, yes.

Q.—Then in December, 1924, you were saying: " I think it is safe to assume that we shall not get to the full output of 2,000 cubic yards per hour, and that fact must be faced."

A.—Yes. Now in the light of experience we think that this soft silt which has been so much talked of can make suitable reclamation, and we are not going to dredge this heavy material. We should leave it alone. If you were to use your dredger on anything at all except this bottom layer of clay and stones, the dredger cuts it all right but naturally it is heavier material and you would not get your 2,000 cubic yards. But we shall not do it. If you keep to where there is suitable material then you can dredge as much as you like.

Mr. Billimoria.—Where do you say, " Do not do it "? Is there any letter or correspondence or document in which you say that?

A.—Yes, there are documents on the subject—I think I can produce them—in which we have said, " Lift your ladder and do not go messing about there."

Q.—Dated 1926?

A.—Well, I can produce the letters.*

Mr. Billimoria.—If you please.

The Chairman.—For the moment we are discussing the harbour, are we not?

A.—We are discussing the harbour; we are not discussing Back Bay.

Q.—That is right. I want to put a figure or two to you. In December, 1924, as you were saying, you thought it safe to assume that you would not get the full output of 2,000 cubic yards an hour, and the dredging would be going on well if you got two-thirds of that output?

A.—Yes.

---

* See Appendix V.

Q.—In fact, the history is, is it not, that in the first season she began operations on the 8th December, 1923?

A.—I will take that.

Q.—And throughout that season she did an average pumping of 1,020 cubic yards per hour. You have seen the figures?

A.—I have seen the figures, but really I take with great reluctance any figures which have been produced in Bombay.

Q.—Will you repeat that answer?

A.—Really I take with great reluctance any figures which have been produced in Bombay. In reading this evidence I am quite sceptical about any figures which have been produced for the Committee in Bombay.

Q.—At all events, the figures produced before us in Bombay are vouched for by Sir Lawless Hepper, Mr. Lewis and Mr. Elgee, and a number of other witnesses, and point to the fact that the " Sir George Lloyd " dredged 1,020 cubic yards per pumping hour during the season 1923-1924?

A.—Yes.

Q.—That during the season 1924-1925 she did 856 cubic yards per pumping hour, which is a considerable drop, and during the season of 1925-1926 she did 959 yards. Those three figures give an average of 941 cubic yards per hour, which is less than 50 per cent. of her output?

A.—Assuming those figures are correct, you mean?

Q.—Yes.

A.—Assuming they are correct, it does not necessarily imply that there was anything the matter with the dredger. Supposing you went to the Motor Show and brought a Rolls-Royce car, and you took it home, and we will suppose that not you but anyone handed it over to your wife who had only driven a Ford, and she went out with the Rolls-Royce and she could not get speed or anything out of it : you could hardly blame the Rolls-Royce Company if there was a complaint. I maintain that the dredger has never been worked.

Q.—Let us see how that analogy holds. You say a man buys a Rolls-Royce, and hands it over to his wife who had never driven anything but a Ford. Did you nominate Mr. Lewis as the engineer?

A. I did nominate Mr. Lewis.

Q.—Had you complete confidence in Mr. Lewis when you nominated him?

A.—I had complete confidence in him when I nominated him.

Q.—Did you nominate Mr. Speirs as dredging master, or did you get Simons & Co. to nominate him?

A.—I did.

Q.—Had you complete confidence in Mr. Speirs?

A.—At that time I had complete confidence in him.

Q.—He was a very good man?

A.—Yes.

Q.—Did you nominate Mr. Brims?

A.—I nominated Mr. Brims.

Q.—And approved of, and quite rightly pressed the appointment later on of Mr. Elgee?

A.—That is quite true.

Q.—I am trying to work out your analogy.

A.—But I did not nominate Sir Lawless Hepper.

Q.—But Sir Lawless Hepper did not work the dredger, did he?

A.—No.

Q.—Taking the actual conduct of the work, first of all there was Mr. Lewis, who should be the driving force, and secondly there was Mr. Speirs, the dredging master, and the crew?

A.—Yes.

Q.—With confidence in the dredging master and confidence in Mr. Lewis, ought not the dredging people to have got a better result than less than 50 per cent.?

A.—I do not think so. They did not work 24 hours a day, for one thing. Mr. Brims went out with orders to work 24 hours a day. They could not get their staff.

Q.—The point we were on was the quality of the material?

A.—Yes.

Q.—As to whether right the way down to December, 1924, nobody, neither you, Mr. Halcrow, Sir Lawless Hepper, Mr. Brims, Mr. Speirs, nor anybody, knew really what the dredger was going to come up against as soon as the dredger began to work?

A.—No. I beg your pardon. We knew what the material was, but we did not know how it was going to dry out. Perhaps I had better read my notes now on clay.

Q.—Do, please. It is not contained in your statement I understand?
A.—No, but I will give it to you.

Q.—Will you read it?

A.—" There has been so much talk during this inquiry about soft clay, stiff and unctuous clay and hard clay, and the unsuitability of the dredger for the material being dredged in the harbour, that one really gets on reading the evidence a little bewildered. I obtained such information as I possibly could about this material before I specified the dredger for soft clay. I had frequently been over the Sewri Reclamation with Mr. Messent, the late Chief Engineer of the Port Trust. I had also inspected the Bombay Dock works when under construction. I had to make use of land at Sewri, and personally examined it in connection with storing materials. I had frequently discussed reclamation works with Mr. Messent off and on for years past, and he was a friend of mine of 30 years' standing. From all the information I could obtain I diagnosed the material as soft, and I maintain that that is a correct diagnosis. I was, indeed, really rather surprised at Mr. Kidd, with his knowledge of the material, going to the extent of taking such a large number of borings. The very way in which the borings were taken satisfied me that there was at all events no hard rock or moorum above a certain level. Our great trouble and apprehension in Bombay was that we should not get enough of the stiff, unctuous clay, and would have to be content with the silt overlying the clay—we knew that there was silt, and we knew that there was clay. Mr. Kidd had said that both the silt and the clay were suitable for reclamation purposes. The Port Trust and the Indian Marine had deprived us of dredging over a large area where Mr. Kidd's borings had proved there was clay in abundance. The question which exercised my mind and the mind of the engineers in Bombay more than any other was whether this silt above the clay would dry out satisfactorily. A Mr. Mitchell in Bombay had given most pessimistic accounts of the time the material would take to dry out, and I began to be anxious whether, in the absence of the stiff unctuous clay, the silt would really be serviceable. My reason for advocating a test of the material and asking Mr. Lewis to borrow a dredger for experimental purposes was solely based upon this fact and had nothing whatever to do with the suitability of the material for dredging. Mr. Lewis obtained some of the silt and clay and deposited it within a small enclosed area. I carefully examined it on my return to Bombay before the dredging operations started. It seemed to me to dry out well, and I was quite satisfied; but Mr. Mitchell the pessimist came along and told us that the first rains would reduce it to a semi-liquid condition. When the dredger actually started work we were very pleased with the result. The material was clay and stones and sand, which was dealt with quite well by the dredger, and hardened out so quickly that in a couple of days the reclaimed ground could be walked over. The material was most excellent for reclamation purposes, and it was being well cut by the dredger, but it was not the stiff unctuous clay, and quite obviously, if there was nothing but this clay, sand and stones, although it made most excellent material for reclamation, you would not get the same output out of the dredger as you would with stiff unctuous clay. In the light of experience we came to the conclusion that this clay and stones and sand, which were the bottom strata, should be left alone, and it would be preferable, as soon as that was reached, to raise the ladder of the dredger and move on to the silt and clay. In fact, the complaint in one of our letters that the dredger was dredging in unsuitable material was with reference to the fixed determination of the dredging staff to work in stones, sand and clay when there was an abundance of other and more suitable material available.

Q.—What date is that letter; have we got it?
A.—I can give you the date; it is quoted.

Q.—Is it quoted in your statement?
A.—I think it is in my statement, but I can give you the date of it.

Q.—Is there any letter in which you tell them that they are working too deep?
A.—There is, and we can produce that.*

Q.—You will let me have that later?

A.—Yes. It has been stated that I used the words " hard clay " several times in my report; but when one writes one does not do so with the idea that words will be examined years afterwards with a microscope; if that were the case everyone would cease writing altogether. I knew the clay was not hard in a dictionary sense of the term—unyielding to the touch, solid. I used the term in reference to and in comparison with soft silt which did not harden at once on being deposited and in which a man would sink to his middle. In my report dated 14th February, 1924, I said: " I believe that the result up to date has been quite satisfactory; the material in the harbour had proved much harder than we were led to suppose, and the actual reclaimed land can be seen and walked upon by anyone who chooses to go to Colaba. The word " harder " obviously

* See Appendix V.

refers to the quality of the reclaimed land. Further, whatever I said or did not say we know for a fact that the clay is not hard clay. That was also stated definitely by Mr. Kidd in his evidence, with which I concur. If I may I should now like to come to the suitability of the dredger " Sir George Lloyd " which was designed for soft clay, to cut a stiff unctuous clay which Mr. Kidd assumes was in abundance. Mr. Kidd in his evidence said that he had satisfied himself that this stiff and unctuous blue clay is the same all over the harbour. He also said that the dredger " Jinga," the Port Trust dredger, had her best figure of output when she was working for the most part in blue clay, and he says that he was an eye witness of the successful cutting of the stiff unctuous blue clay at the Sewri reclamation when the " Jinga " working in blue clay discharged through 3,465 feet of pipeline at the rate of 1,480 cubic yards per hour. Now it is worthy of note that the dredger " Jinga " which did so extraordinarily well in this stiff unctuous clay was designed to work in soft clay. The " Sir George Lloyd " was also designed to work in soft clay, and has, I understand, the same cutter as that in use on the " Jinga." It seems to follow that if the " Jinga " did such excellent work in this stiff and unctuous blue clay, there is no reason why the " Sir George Lloyd " should not follow suit. Mr. Kidd also says in his evidence that he is satisfied that the material is available in sufficient quantity in the harbour, and that dependence can be placed upon the surveys made in 1912 for dredging in 1919, and that he is perfectly convinced that reclamation can be done to-day more cheaply by dredgers properly worked than by any other method. I concur entirely with Mr. Kidd in these conclusions. Mr. Kidd also had some interesting remarks to make on the magical effect of a bonus, and he relates how when he operated the Port Trust dredger for his own purposes he got outputs very much in excess of the very best outputs that had ever been obtained in the Port Trust operations, and he attributed these results solely to the fact that he had paid the crew a bonus on results. Personally, I have not the slightest doubt that the dredger is designed for soft clay which is the same as stiff and unctuous blue clay. I am satisfied that there is an abundance of material—that in the light of all the experience we have now got—in the harbour for reclamation purposes; but I am quite certain that under the existing organisation you will never get the output from the dredger.

Q.—I will return a little later to that; but your view as expressed here that the dredger is correctly designed for soft clay or stiff unctuous clay is in direct opposition to Mr. McMurray, is it not?

A.—I have never studied Mr. McMurray's evidence.

Q.—It is worth while looking at it. It will repay study.

A.—Mr. McMurray said that the dredger was designed for soft clay?

Q.—I will read you the extracts a little later, but I want to take this in passing. Is it not also in opposition to Sir John Biles' view?

A.—Sir John Biles was never in Bombay. I do not know what Sir John Biles said, but he was not out in Bombay.

Q.—Have you looked at his evidence?

A.—I cannot say that I have read the evidence. I have glanced at it.

Chairman.—I will refer a little later to the passages.

Sir Harry Courthope Munroe.—I have a supplemental statement which was got out last night which has a few additions to the statement you have already had.

A.—I have not got a copy of that. These are only some notes which I made for myself which I thought might be useful in the course of the examination, and naturally I will hand them in from time to time.

Chairman.—Going back to your statement, you speak of the letter of the 23rd May, 1919, but I think you omitted from your statement a passage of importance, namely, the statement: " That the best dredgers in the world were made by one or other of four firms in the Clyde district." Do you remember that?

A.—Probably. I agree to that.

Q.—One of the firms that you had in your mind would be Messrs. Simons?

A.—Yes.

Q.—Mr. McMurray is their London representative?

A.—Yes.

Q.—And a partner?

A.—I do not know what his position is.

Q.—Is he a man who has a very good knowledge of dredgers?

A.—Yes; he has as good a knowledge of dredgers as any man.

Q.—Sir John Biles said in his evidence that there were very few people who would pit their opinion against that of Messrs. Simons. Is that about right?

A.—For the particular type of dredger?

Q.—In dredging matters?

A.—No; for a particular type of dredger.

Q.—I think he said it generally—that generally Messrs. Simons were a firm whom very few people would care to pit their opinion against, meaning that Messrs. Simons as dredger-builders were people of eminence, experience and good judgment.

A.—Yes.

Q.—Do you agree with that?

A.—I agree with that.

Q.—There is a letter to which I must refer of the 25th of May from the Governor of Bombay to Sir George Buchanan. It is an important letter. It is quite short. Have you got the original here?

A.—Is that in my statement?

Q.—No; you do not mention it. I can summarise it and recall it to your recollection. We have had it read in evidence. It is a letter in which Sir George Lloyd said that he wanted you to tell him whether the project was feasible and whether prices made it a reasonable proposition, and that if you said it was not, he would abandon all idea of that project and turn to something else. Do you remember that?

A.—Excuse me; I think that was an interview. I do not think that was a letter.

Q.—I assure you it was a letter. I will find it in Lord Lloyd's evidence. I want to bring that out because it has been said that Lord Lloyd was definitely committed to the scheme, and that nothing would push him away from it. That letter ought to come out in fairness to Lord Lloyd, and you ought to express some opinion about that letter.

A.—Well, the gist of the letter, such as it is, is given in my statement at page 29.

Q.—I must read the letter. You may take it that there was a letter of the 25th May, 1919, in which Lord Lloyd told you that if you advised against it he would finally abandon the whole thing and would turn to some other project without another ten days' discussion. Does that recall it to you?

A.—I do not remember the letter. I remember the interview, because at page 29 of my note I have said: "On the 28th May, 1919, I had an interview with Sir George Lloyd. Sir George Lloyd discussed with me my terms of reference, asked me a number of questions, and said that the Back Bay scheme had for years past impeded progress in Bombay." He would give me his entire and absolute confidence, and if I said the scheme was impracticable he would turn it down at once and start on something fresh; but once my opinion was given he would refuse to allow any other expert to report; and he asked me not to let him down. That was the interview, but I do not remember the letter.

Q.—We have had the letter, and I will find it. That interview, when he asked you not to let him down, satisfied you that you had his full confidence, did it not?

A.—Certainly.

Q.—His full confidence?

A.—Yes.

Q.—If you wrote a report saying: "This is a feasible scheme. This can be done at such-and-such a price," you knew that Lord Lloyd would accept that as decisive and final and go ahead with the scheme?

A.—Yes.

(Adjourned for a short time.)

Chairman.—The letter which I mentioned before the adjournment is dated 25th May, 1919, and is in reply to your letter of the 23rd, which you have set out in part at page 29 of your statement: "My dear Sir George. Thank you for your letter of May 23rd. I should wish to leave the date of your departure entirely to your own discretion, and if you think that the enquiries and final report which I am asking you to undertake will be hastened rather than delayed by your getting to England at once, please make plans accordingly. All I am anxious for is to know as early as possible whether a Back Bay scheme is feasible, and, on present prices, is a desirable enterprise. If not to abandon it finally and turn our energies in other directions, or if it is found practicable to get on with the job without another ten days' discussion. I shall hope to see you on Wednesday next and discuss the matter fully with you." Do you recollect that letter?

A.—I seem to recollect that letter, but I do not seem to have got it among my papers.

Q.—It is an extremely business-like letter, is it not?

A.—Yes.

Q.—It goes to the two points—whether the scheme was feasible, and, on present prices, a desirable enterprise. It really follows out what you had said a little time before

when you had taken the two points up—whether it was practicable, and practicable at the prices then ruling?

A.—Yes.

Q.—Then he says " If not to abandon it finally "?

A.—Yes.

Q.—Do you read that letter as an indication that Lord Lloyd at this date, 25th May, 1919, was not in any way pledged to the carrying through of the Back Bay scheme?

A.—I do.

Q.—That if you had advised against it that would have been absolutely final, and, as he says, he would have turned his energies into other directions?

A.—Yes.

Q.—He says he wants to get on with the job without another ten days' discussion?

A.—Yes.

Q.—He may have had in his mind Mr. Rudyard Kipling's lines, that " the more we work and the less we talk the better results we shall get." It is not a bad working rule in life, even with Committees, is it, Sir George?

A.—I agree, Mr. Chairman.

Q.—Now, you concluded just before the adjournment by referring us to the substance of your interview with Lord Lloyd on the 28th May, 1919?

A.—Yes.

Q.—In which he places himself entirely in your hands and asked you not to let him down?

A.—Yes.

Q.—In writing a report the duty, of course, of every professional man is to put the pros of the scheme and the cons of the scheme fairly forward?

A.—Yes.

Q.—You set out whatever advantages you conceive the scheme has, and equally you must set out in full prominence the disadvantages. Is that so?

A.—Yes.

Q.—And the difficulties?

A.—Yes.

Q.—And the uncertainties?

A.—Yes, the uncertainties.

Q.—Of course, neither Sir George Lloyd nor Mr. Curtis, or anybody in Bombay, would be likely to be aware of the immense technical difficulties?

A.—No; if I may interpose a few words here, Mr. Chairman, I was not initiating a scheme which had not been previously considered. I was examining and reporting on a scheme which had already been accepted by the Government of Bombay, and which they had sent up to the Government of India for sanction, about which they said they had absolutely no doubt.

Q.—True. At the same time they were referring the matter to you as the final authoritative expert, were they not?

A.—Well, my terms of reference——

Q.—Wait a moment. Were not they referring the matter to you as the final authoritative expert?

A.—Yes.

Q.—In Lord Lloyd's own letter he makes it clear to you that if you pronounce against it he will turn his energies into other directions?

A.—Yes.

Q.—Will you continue?

A.—I agree, Mr. Chairman. I would again emphasise that I was not initiating a scheme which had not been considered before. I was examining and reporting on a scheme which had already been accepted by the Government of Bombay in terms, really, which you would have though might even have convinced the Government of India, but they did not.

Q.—That is putting the position quite exactly; that is right. It was because the Government of India were still unconvinced that they said " Let us have someone on whose decision we can rely "?

A.—Yes, but were not the Government of India unconvinced more especially on financial grounds?

Q.—In a moment we will come to the terms of reference and have a look at them. Did you, at the interview of 28th May, page 29, or at any other interview, tell Lord

Lloyd that the nature of the material could only be ascertained when the dredger actually began to work?

A.—No.

Q.—You must have known that, must you not, when you went to the interview?

A.—No.

Q.—Let us see what information you had. This was 28th May—two days before you were leaving for England?

A.—Yes.

Q.—By that time you had concluded your enquiries?

A.—Yes.

Q.—You had, of course, read Mr. Kidd's report at that time?

A.—Yes.

Q.—And you had seen his description of the clay?

A.—Yes.

Q.—You had seen that he had taken 1,314 borings and had recorded 1,159?

A.—Yes.

Q.—And you had seen plan No. 5?

A.—Yes.

Q.—What information had you between 28th May, 1919, and February, 1922, which led you, in February 1922, to say that the nature of the material to be dredged could only be ascertained when the dredger began to work? What had happened in the interval?

A.—The only thing that had happened in the interval was that Mr. Mitchell had expressed the opinion that this silt would not dry out. There was never any question as to whether the dredger would dredge the material or not. It was nothing to do with the dredger. When the Indian Marine and the Port Trust deprived us of a large area of land, we were left with a superfluity of silt, and the question arose whether this silt would dry out and make satisfactory filling. We now think that it will, but there were insistent statements in Bombay that this stuff would remain always in a semi-fluid condition, that it would not make good filling. I used to go down and look at the Sewri reclamation and examine that.

Q.—But did not the Sewri reclamation come to an end in 1913?

A.—The Sewri reclamation came to an end in 1913, but the land was still there.

Q.—The reclaimed area?

A.—Yes.

Q.—On plan No. 5 recording the 1,100 borings there are in each circle three sets of figures, are there not?

A.—Yes.

Q.—One is the silt?

A.—One is the silt.

Q.—So that a study of plan No. 5, if Mr. Kidd's borings were correct, would show you exactly the quantity of superimposed silt with which you had to deal?

A.—Yes.

Q.—When did you first begin to be uncomfortable about the silt as a possible material for reclamation?

A.—We have to go farther on into the statement for that.

Q.—Can you just indicate it to me, and I will pass away from it?

A.—On page 97 of the statement you will find there is correspondence initiated by Mr. Lewis.

Q.—That Mr. Mitchell had reported adversely?

A.—Yes.

Q.—On the 12th May, 1921, you write to Mr. Lewis " Mitchell's poor opinion of the material for reclamation is certainly disconcerting, but it cannot be any worse than the material used at Sewri "?

A.—Yes.

Q.—So that by the 12th May, 1921, you were disconcerted by Mr. Mitchell's opinion?

A.—I was disconcerted by Mr. Mitchell's opinion about the silt.

Q.—We are on silt now, Sir George. Ought it not to have occurred to you—or might it not have occurred to you—when you were studying Mr. Kidd's plan No. 5, that you would have a great deal of silt to deal with before you got at the clay?

A.—Yes, but we were going to put the silt at the bottom and the clay at the top.

Q.—Quite true. Therefore you did regard, in 1919, the silt as a material worth dredging?

A.—Yes.

Q.—It had to be dredged. You could not get to the clay?

A.—It had to be dredged, but in the light of events we are now quite satisfied with the silt.

Q.—You mean since the sealing of the sea wall?

A.—Not necessarily since the sealing of the sea wall. We will bring evidence later on.

Q. Are we going to have the pleasure of seeing Mr. Halcrow?

A.—Mr. Halcrow and Mr. Settle.

Q.—So be it. The first season's dredging, for some reason or other, was said to give an output of 1,020 cubic yards per hour instead of 2,000, and that matter was brought to your attention, was it not?

A.—Yes. Well, as I say, I do not accept any of these figures, but we will take them.

Q.—At all events let us put it generally. Was it brought to your attention that the output of the dredger in the season from 8th December, 1923, to April or May, 1924, was very disappointing?

A.—It was, yes.

Q.—Did you tell Mr. Cowasji Jehangir, Sir Lawless Hepper, and other gentlemen, that the first season's working must always be regarded as experimental?

A.—It depends on what you call experimental.

Q.—I am asking you first of all the question, did you in fact tell Mr. Cowasji Jehangir, Sir Lawless Hepper, Sir Leslie Wilson, the present Governor of Bombay, and other gentlemen, that the first season's dredging must always be regarded as experimental? You can explain afterwards.

A.—Yes, I will agree to that.

Q.—That being so, that was a fact which, of course, you would have known on 28th May, 1919, when you had the interview with Lord Lloyd. It was not a new fact to you?

A.—No.

Q.—Did you tell Lord Lloyd that the first season's working must be regarded as experimental?

A.—No.

Q.—Did you tell him that the cost of the dredging and filling must be an uncertain quantity until you had had actual experience?

A.—No, I did not think it would be an uncertain quantity.

Q.—Did you not? You thought it even as late as 1924, did you not? Look at page 39: "So far as I can see Mr. Lewis's figures are generally acceptable, except that the cost of dredging and filling must be an uncertain quantity until we have had experience of this season's work"?

A.—Yes. By "uncertain quantity," you have to take into consideration the hours of working and—well, everything connected with the working of the dredger.

Q.—Your estimate in your report of October gave the figure of eight annas per cubic yard, did it not?

A.—Yes.

Q.—That was an all-in figure for supplying the plant, supplying the dredger, the booster, the pipe lines. reconditioning of vessels, engagement and payment of crew?

A.—Yes.

Q.—All the operations necessary to dredge the silt and clay from the harbour, transport it across the peninsula and put it on the reclamation?

A.—Yes.

Q.—And I think in your report you expressed yourself as confident that your figures could be relied upon?

A.—Yes, I think they were based on reliable data.

Q.—How was it, if you were confident in October, 1919, that the figure for dredging and filling was eight annas a cubic yard, you were found saying in 1924 that the cost of dredging and filling must be an uncertain quantity?

A.—Because I was not so confident of the general arrangements. We were not working 24 hours a day.

Q.- As regards 24 hours a day, you never recommended that in your report, did you, Sir George?

A.—Not in my report, but when Mr. Brims went out, he went out with instructions to work 24 hours a day. He gave it in his evidence.

Q.—One of the matters that would always give a reduced output in the first year would be the necessity of training the crews, would it not?

A.—Yes. It would depend on whether you could get trained crews.

Q.—Anyhow, it is one of the uncertainties. You might be able to get a trained crew; on the other hand, you might have to train the crew?

A.—Yes, you might have to train your crew.

Q.—Was that a matter which you mentioned to Lord Lloyd at all as one of the uncertainties that might reduce the output in the first year?

A.—I did not discuss with Lord Lloyd all the contingencies that might possibly arise. I thought that the dredger was a practicable proposition. I still think, with proper working, it is and should always have been a practicable proposition.

Q.—With regard to these matters which I have mentioned——

A.—May I just interpose one remark here? When I went out to Bombay in the first year of the dredging, I found one man at work on the dredger. I said, " What is going to happen if that man falls sick? "

Q.—You mean Mr. Speirs?

A.—I was told, " Well, the dredger will have to stop work if that man goes sick." Surely that is an uncertainty? If you have all these uncertainties, what are you going to do about your prices, or anything else? That was the beginning of the dredging season.

Q.—That was December, 1923?

A.—Yes.

Q.—In your capacity as expert adviser, and supervisor of the work, did you make any representation to anyone with regard to that?

A.—I constantly made representations.

Q.—On that one point?

A.—Certainly I did, on that one point.

Q.—You wanted an assistant dredging master out, did you not?

A.—Yes.

Q.—And did they, in fact, get one?

A.—In fact they did get one.

Q.—The first year's working anyhow, must have been a failure, must it not?

A.—No. I do not see why it should have been a failure.

Q.—Do you not? They were only working one shift?

A.—From that point of view, certainly.

Q.—The first season's working must have given a very reduced output. Let us put it in that way?

A.—Yes, certainly, only working one shift.

Q.—I think the committee would very much like to know from you whether when you found one shift working, you discussed this matter with Sir Lawless Hepper, and said " You must get a second shift on at once." What did you do with regard to it? You see the position is this,is it not.? Sir Lawless Hepper has disclaimed any technical knowledge. He says " I was a mere administrative head." You were on the spot. You were seeing that there was only one shift, contrary to your advice. What did you do to force them to get a second shift trained?

A.—I was always faced with a *non possumus*. Certainly I discussed it with the dredging superintendent. Certainly I discussed it with Sir Lawless Hepper, but, as I say, we were always faced with a *non possumus*.

Q.—That puzzles me a little. You will forgive my trying to get at this. We want your help about it. You see you said in your report " This reclamation will be done in this manner."

A.—Yes.

Q.—" The dredger will pump 2,000 cubic yards per hour for 15 hours a day for 170 days of the working season working double shift."

A.—Yes.

Q.—The whole essence of the thing depended on double shift, did it not, according to you?

A.—Yes.

Q.—On at least double shift?

A.—Yes.

Q.—You went out there. You were the man whom Lord Lloyd said would, it was fairly obvious, be selected. Whatever you had said would have had to be obeyed I should have thought?

A.—Oh, no, Mr. Chairman.

Q.—Let us hear what difficulties you had in the matter. If you had said to Sir Lawless Hepper " You must get a double shift trained at once " and if Sir Lawless

Hepper had raised difficulties, ought not you to have told the Government of Bombay that you could not remain as engineer to the works?

A.—Yes, I might have resigned, certainly. But I was not carrying out——

Q.—Would not the slightest hint of your resignation have made everybody in Bombay do anything you wanted them to do?

A.—No, Mr. Chairman, I do not agree with that at all.

Q.—What would have been the position of Sir Lawless Hepper, who had assumed office on the strength of your report that the dredger was to work double shift, if he had said " Oh, we cannot get a double shift." ? He would have had to have got it, would he not?

A.—No, he would have said he could not get it.

Q.—Very well.

A.—I would like to produce the various letters in which we have urged them to get it.

Q.—Are they in your statement?

A.—I am not certain whether they are in my statement, but there are letters in which we have said " Will you get a double shift "? In the second year's dredging we sent out a cablegram saying " We must have a double shift, have you got the staff? "

Q.—But that was the second year?

A.—Never mind. The chief engineer replied, forwarding five references which he had made to the Development Department, to which he had had no reply at all, and in which he had asked that arrangements should be made.

Q.—I do not think we have got that correspondence?

A.—I will see that you have it.*

Q.—Thank you very much. We have just touched on the question of the first year's working being experimental, and on the reduced output owing to the possibility of having to train a crew, and matters of that kind. Are any of those difficulties indicated in your report?

A.—In my report of 1919?

Q.—Yes?

A.—No. You do not in a report indicate every possible contingency or difficulty which you may come across in the course of working. You cannot possibly know a lot of them.

Q.—But surely the object of an expert is that he should have had experience of similar works, and that he should know these things?

A.—It is admitted that this is the largest dredging proposition that has ever been done. Naturally, from time to time you would be up against new contingencies. It was not like building a house. You cannot foresee everything. You cannot foresee every small thing which is going to happen.

Q.—I am only on the broad things. You must have known in 1919, when you were writing your report, that the first season's work was likely to be experimental. Indeed, I think you have told us so. Ought not it to have been put in the report—just a passage saying something like this: " In all these big enterprises unexpected matters occur. For instance, the first season's working may be largely experimental because of the fact that we may be only able to get an untrained crew; we are not aware of the strength of the tides and many other difficulties,"—something of that sort?

A.—I can see circumstances where it would not have been experimental, where the dredger would probably have done most excellent work for the whole of the season. I admit that under the circumstances which existed in Bombay the dredger did not do the full output, but I do not admit that those were normal circumstances. I say that under other circumstances with competent and energetic men, they would have got additional output. I say, on page 116 of my statement: " Mr. Merritt, the assistant dredging master of the dredger ' Sir George Lloyd,' in the course of his evidence summed up the situation admirably. When asked in what respects the dredging in Bombay differed from work done elsewhere he replied: ' One is run by a private company, and they want their pound of flesh. If you do not turn over the percentage you have to make room for someone else.' " Under other circumstances, with a bonus on output and continuous working, those dredgers would undoubtely at all events have come up to such an output that there would have been no complaint about them.

Q.—I will return to that when we are dealing with the character of the material. Going back to page 29 of your statement, on the 29th May you wrote to the Joint Secretary of the Government of Bombay, Public Works Department, as follows: " With respect to the proposal to obtain my professional opinion and advice on what is know as the Back Bay Reclamation Scheme, I have read the terms of reference, and beg to reply as follows. I have examined the site on several occasions, and have satisfied myself that the survey and borings made by Mr. Kidd are sufficient to enable me to write my report." How had you satisfied yourself that the surveys and borings were sufficient?

---

* See Appendix VI.

A.—I do not think you ought to read those together, Mr. Chairman. I have examined the site on several occasions. I have been all over the site. By saying that I had satisfied myself about the survey and borings made by Mr. Kidd I did not mean that I took any borings. I had satisfied myself because I had got his.

Q.—I accept that interpretation of it. " By satisfying yourself " you meant, " I am satisfied in my own mind "?

A.—I am satisfied in my own mind.

Mr. Billimoria.—Is that the impression which an ordinary reader of that letter would get, Sir George—that it was in your mind that you were satisfied?

A.—We do not always write letters with a view to people being impressed with them later on.

Chairman.—I think, Mr. Billimoria, that is a reasonable interpretation.

A.—" I have examined the site on several occasions, and have satisfied myself about the survey and borings."

Q.—We have now arrived at the point when you had received Mr. Kidd's estimate of 1912?

A.—Yes.

Q.—You notice that on page 2 of that report he says: " The clay which is stiff and unctuous hardened into perfectly solid ground in a very short time "?

A.—Yes.

Q.—Stiff clay is one thing and soft clay is another?

A.—Stiff clay——

Q.—Stiff clay is stiff clay?

A.—Stiff clay in this sense is soft clay; it could not be anything but soft clay; it might be stiff and unctuous.

Q.—You say that stiff clay in the passage I have read from Mr. Kidd's report really means soft clay, is that it?

A.—Yes.

Sir Frederick Hopkinson.—And that it cannot be anything else?

A.—It cannot be anything else.

Chairman.—In the passage in your report where you refer to it as hard clay does that mean soft clay?

A.—I dealt with that in the note that I read before lunch.

Q.—Let us see if we can get it right because I have not had an opportunity of reading that carefully. Do you mean then that the phrase in your report, " hard clay," was a mistake, and that you used the wrong adjective?

A.—I used it in a different sense. I used it with reference to the hardness with which it would dry out. I did not use it with reference to the hardness in which it was in the ground.

Q.—You say that you used it with reference to the solidifying properties it would display after being reclaimed?

A.—After being reclaimed. I never for one moment used it with reference to the state in which it was in the ground.

Q.—Let us see about that. The passage in your report is : " The soft mud will form the bottom layer of filling and the hard clay which lies below the mud over the area to be dredged will be superimposed on the clay "?

A.—Yes.

Q.—That is the passage, is it not?

A.—That is the passage.

Q.—Are you quite right when you state that you have never used the phrase " hard clay" with reference to the clay as it was in the bed of the sea?

A.—Quite certain, because I am absolutely certain that it is not hard clay.

Q.—Have you ever described the clay in the bed of the sea as being compact hard material?

A.—Never to my knowledge as hard compact material. Certainly if you go deep enough down into the earth you will find any material, but down to Mr. Kidd's borings there was never anything hard.

Q.—Will you turn to page 32 of document No. 18 : " In forwarding the findings of the Conference to you "—that must have been the meeting of the 9th January?

A.—Yes.

Q.—It says : " At a conference on dredging operations held in the Chief Engineer's office on the 9th January, the following conclusions were arrived at." we can pass over those conclusions.

A.—Yes.

Q.—Then it says: " In forwarding the findings of the conference to you I observed in the covering letter dated 10th January, 1924, that after the grave doubts which had been expressed at various times as to the suitability of the material in the bed of the harbour for reclamation purposes, it was an agreeable surprise to see that what was being pumped consisted largely of a hard compact clay with which we had reason to be quite satisfied." Does not that mean a compact clay because for centuries it had been pressed in on itself?

A.—No, that means, as I explained before lunch, that they were then dredging below the clay on to the hard material. Subsequently we told them that they were not to dredge on to that hard material. If they came across it they were to lift their ladders. May I put it in this way: *There* is the silt, *there* is the clay, and below the clay, as is shewn on all Mr. Kidd's borings, you get to moorum, hard clay, stones, silt. (*The Witness drew a diagram*).

Q.—That is right?

A.—As I tried to explain, that makes most excellent filling. The dredger cut it without any difficulty at all, but you would not get your whole output from it.

Q.—Surely you never anticipated that they were going into the moorum, did you?

A.—We do not want to go into the moorum. We later on told them to go out of the moorum.

Q.—The evidence that they have given is that they never tried to get into the moorum because the moorum was composed of rocks, stones, and all sorts of things. Here clearly at page 32 you are not referring to moorum at all, are you?

A.—Yes.

Q.—" It was an agreeable surprise to see that what was being pumped consisted largely of a hard compact clay with which we had reason to be quite satisfied."

A.—Certainly; it was an agreeable surprise. Here we had been told by the Bombay pessimist that we should get nothing but silt, and that the silt would not dry out, and we saw excellent material coming through the pipes. It was one of their best season's work, but there were stones and sand with it. Later on, as one of my witnesses will tell you, when he went out there we insisted that to get the output they must get up from this and get on to the clay and the silt. I maintain that they were dredging at that time down below Mr. Kidd's silt and clay into the clay stones and silt in which although it is very good for reclamation you do not get your full output.

Q.—If you will take the paper in your hand which you have drafted out, No. 1 we might call the silt?

A.—Yes.

Q.—No. 2 is the clay and No. 3 the moorum?

A.—Yes.

Q.—One layer above the other?

A.—One layer above the other.

Q.—Will yon please read at page 32 and tell me whether the material to which you were referring there, a hard compact clay, did not come out of No. 2 and not out of No. 3?

A.—No, it must have come out of No. 3.

Q.—Why do you say that it must have come out of No. 3?

A.—Because we know the facts of all these borings. Where he took his borings he could not have gone into clay and stones; it must have been No. 3.

Q.—Did you at one time express the hope that there would be a great deal of hard clay to be found in the dredging?

A.—As I say——

Q.—Will you answer the question first. Did you at one time express the hope that there would be a great deal of hard clay found in the dredging?

A.—Very likely I did, but what did I mean by it?

Q.—How was a dredger designed to cut soft clay going to deal with hard clay?

A.—Because the hard clay was with reference to the hardening out. We have got samples of the material, and I still say that the soft clay is the material there, that the dredger was properly designed for soft clay, and that there are millions of cubic yards ready to be dredged. I should like to show you some examples.

Q.—We have one here somewhere. If you have any samples that you would like to show us we should be most happy to see them, not necessarily now, but at any time you like?

A.—Yes, we have got samples.

Q.—Are they as heavy as that sample? (*Sample of hard clay handed.*)

A.—Yes, that is the material below the unctuous blue clay.

Q.—That is what you would say was in compartment No. 3 of your diagram?
A.—Yes, I would say that that was in compartment No. 3.

Q.—Let us keep that in our minds. Compartment No. 1 is silt, compartment No. 2 clay, and compartment No. 3 moorum, rock, stones. Mr. Kidd uses an alternative word for silt. He calls it mud, does he not?
A.—Yes.

Q.—Do you accept that?
A.—You can call it mud, yes.

Q.—It is the recent washing down from the monsoon rains through the rivers, is it not?
A.—Yes. You can call it silt or mud; it is immaterial to me.

Q.—On the 25th July, 1919, which would be when you were half way through your report, you wrote a letter to Mr. McMurray in which you spoke of the material as "clay"?
A.—Yes, as clay.

Q.—A day or two before that, according to Mr. McMurray, you had had an interview with him at which you had discussed the general design of the dredger?
A.—Yes.

Q.—Do you remember that?
A.—Yes.

Q.—Had you told him at any time that the dredger would have to work in material that Mr. Kidd had described as stiff clay?
A.—As stiff unctuous clay.

Q.—Yes.
A.—We did not want any better material than stiff unctuous clay.

Q.—That is not my question. I am asking you whether, at the interview with Mr. McMurray, you said to him, "You have got to build a dredger which will do 2,000 cubic yards per hour in stiff clay"?
A.—We discussed it with Simons & Co. in Glasgow.

Q.—Let us get it by steps. At the first interview with Mr. McMurray you did not tell him that you wanted a dredger that would do 2,000 cubic yards per hour in stiff clay?
A.—No, I did not want to dredge stiff clay.

Q.—I am using Mr. Kidd's phrase?
A.—Yes, but I say Mr. Kidd's stiff unctuous clay and soft clay are the same. Mr. Kidd has told you in evidence that the dredger "Jinga" got a better output in the stiff unctuous clay than she did in anything else, and that the "Jinga" was designed for soft clay. The cutter of the "Jinga" is the same as the cutter of the "Sir George Lloyd." If, in the case of the "Jinga," which was designed for soft clay, it did better work in this stiff unctuous clay than in anything else surely the "Sir George Lloyd" dredger also designed for soft clay with a similar cutter, ought to do equally well in this stiff unctuous clay.

Q.—You must have studied the lamentable figures of the "Kalu" and the "Jinga"?
A.—I attribute the lamentable figures of the "Kalu"——

Q.—Will you please answer my question first. We will have to come to those figures later. The figures of the "Kalu" and the "Jinga" are lamentable, are they not, as regards output?
A.—I have not studied them in detail.

Q.—I will take you through them, and we will see what sort of performances the "Kalu" and the "Jinga" did when they got to work. They are lamentable figures if they are true?
A.—I can quite understand them, and I can appreciate what Mr. Kidd says, that when he took one of the Port Trust dredgers and worked it properly, and paid a bonus to the crew, he got a far, far better output than the Port Trust had ever had at their very, very best. I attribute it to the working of the dredger.

Q.—When did you ever mention to the Government of Bombay, or to Sir Lawless Hepper, that they should pay a bonus?
A.—I mentioned it in one of my early annual reports, but the Government of India were so opposed to paying bonuses of any description to anybody that I looked upon it as almost hopeless to think that they would. They never do pay bonuses.

Q.—That is to be found in one of these annual reports, is it?
A.—It is in one of the annual reports.

Q.—I will find it later.

A.—It is not a specific request for bonuses for the dredger. It is simply stating that the disadvantage that the Government has in carrying out works in comparison with a contractor is because they cannot give any encouragement for good work.

Q.—Did you think, in 1919, that you would not get 2,000 cubic yards per hour unless a bonus were paid to the men?

A.—I did not know, in 1919, under what conditions the dredger was going to work.

Q.—As technical adviser to the Government of Bombay, do not you think that you must have put that forward as one of the necessary conditions of employment?

A.—I was not carrying out the work.

Q.—You were technical adviser?

A.—I was technical adviser.

Q.—You say that you mentioned this question of stiff clay at Renfrew. Mr. McMurray has put that interview round about the third week in August, I think. Would that be about right? At all events it is before the letter of the 12th September. Was the interview to which you are referring before the 12th September?

A.—It was on the 29th August.

Q.—What did you say to Messrs. Simons & Co. about its being necessary for the dredger to work in stiff clay?

A.—What happened was this——

Q.—Will you deal with this one point for the moment?

A.—I remember a long discussion on the subject of the material to be dredged. In my letter I had used the word " clay," which is rather indefinite. We read Mr. Kidd's description of the material. Mr. McMurray gave his experience in working the " Jinga " and the " Kalu " which were specified for soft clay, and we considered the material in the harbour to be more or less the same as at Sewri. Colonel Brown, who is I think dead, said that obviously what we wanted was a dredger to cut soft clay, the same kind of dredger as they had had at Sewri. I agreed, and I still maintain that it was the correct designation for the dredger, a dredger to dredge soft clay.

Q.—Were not you greatly astonished when you read Mr. McMurray's evidence?

A.—I have not read his evidence yet.

Q.—Have you not?

A.—Not the whole of it.

Q.—I will take you through some of the material passages in a moment. The letter of Messrs. Simons & Co. on 12th September, which you appended to your report, specifies a dredger designed for soft clay?

A.—Yes.

Q.—And you were content, of course, to let that description pass?

A.—Yes.

Q.—First of all he puts great insistence upon the fact, with which, of course, you do not disagree now, that his firm only promised to deliver a dredger to give 2,000 cubic yards per hour in soft clay?

A.—Yes

Q.—You and he are agreed about that?

A.—Yes.

Q.—Did you notice in that evidence that he disclaimed any possibility of the dredger being able to do that amount in hard clay?

A.—I quite agree. Naturally she would not do 2,000 cubic yards an hour in *this* sort of stuff. (*Indicating sample of hard clay.*)

Q.—Is there any distinction to be drawn between stiff clay and hard clay?

A.—Yes. *That* is hard clay. (*Indicating sample of hard clay.*) Naturally the dredger would not do 2,000 cubic yards an hour in this, but she would do 2,000 cubic yards an hour in stiff clay, which is synonymous with soft clay.

Q.—Stiff is synonymous with soft?

A.—I would like to show a sample of my clay.

Q.—Do you know of any other material in this world in which stiff is synonymous with soft except clay? I thought they were two opposing ideas. I thought that stiff meant one thing and that soft meant another?

A.—No, not when you are dealing with material under water. A stiff clay is a clay that is like hard cheese or butter. You can cut it easily with a cutter. That is what I call stiff clay. You could not have anything better than stiff unctuous clay, stiff greasy clay for a dredger designed to cut soft clay. You could have nothing better in this world than stiff unctuous clay. Mr. Kidd has told you, as I have said before, that the dredger " Jinga " was better (he uses the words) in stiff unctuous clay than in anything

else. Mr. Settle brought these samples back. Here is a bit of the stiff unctuous clay. (*Producing sample.*) May I have a little water?

Sir Frederick Hopkinson.— Of course the Committee has seen the clay as it exists to-day on the Reclamation.

Chairman.—We sent a man in for about 25 yards to get some, and he very nearly got drowned.

Sir Frederick Hopkinson.—That is in the mud?

A.—Even *this* stuff (*indicating sample of hard clay*) the dredger deals with well.

Q.—Would you mind telling us what you are going to do?

A.—I merely want to see what in a few minutes time this is reduced to. This water will show you what it is like in the ground.

Chairman.—Does *that* come from No. 1, No. 2 or No. 3 (*indicating sample of hard clay*)?

A.—That is No. 2.

Sir Frederick Hopkinson.—May I see the dry sample that you have produced?

A.—Yes. (*Same handed.*) (*The Witness placed a piece of the sample of hard clay in a glass of water, and in another glass of water a piece of the sample which he had produced.*)

Chairman.—Have you also noticed with regard to Mr. McMurray that he says that if he had had to specify for a dredger to deal with hard clay he would have had to put forward a very much bigger and indeed unworkable dredger and one much more costly?

A.—Yes, but he was not asked to design a dredger for hard material.

Q.—In your letter of 25th July you asked for a minimum rate of 2,000 cubic yards per hour. Did you notice in the reply of 12th September that they do not offer you a minimum rate, but they say "at the rate of 2,000 cubic yards per hour"?

A.—At the rate of 2,000 cubic yards per hour.

Q.—There is a distinction, is there not, between a request that a machine shall do a minimum rate of 2,000 cubic yards per hour and an offer that it shall do at the rate of 2,000 cubic yards per hour?

A.—Yes. I think you will find somewhere in the correspondence a statement that the pump will do a great deal more than 2,000 cubic yards per hour.

Q.—Not in any document that formed part of the contract with Messrs. Simons & Co.?

A.—I did not make the contract with Messrs. Simons & Co.

Q.—I think you will find that Messrs. Simons & Co. are very canny, and all that they were offering you was a dredger that would do at the rate of 2,000 cubic yards of soft clay per hour?

A.—Yes. I was going to say that nothing will make me change my mind. I have seen the dredger, and I have seen the material. If I were to start to work all over again I should not specify for any dredger other than a dredger to dredge soft clay for that material that is in the harbour. If I had it all to do again I would not have a different dredger at all. I would have the same dredger designed to dredge soft clay as is working there now.

Q.—Did you want a trial of the dredger at Bombay?

A.—No. I think I mentioned it, but it is so very unusual. I cannot recall a single instance of a dredger ever being tested thousands of miles, or even hundreds of miles, away from the builders' yard. I mentioned it, but I never seriously expected that I should get a test in Bombay. I did not want it.

Q.—Did you know that the "Kalu" and the "Jinga" had been taken out and given a trial at the site?

A.—I was told that they were. I do not know what the particulars are. I was told they were given some sort of test, but it is a thing that we never do. I do not know of any other instance of a dredger being tested on the site. I have heard that the "Jinga" and the "Kalu" had some sort of test, but I do not know any other instance whatever of the builders giving the guarantee hundreds or thousands of miles away from the yard. There may be such cases, but I certainly do not know of them.

Q.—Curiously enough, Messrs. Simons & Co. were the builders of the "Kalu" and of the "Jinga," and they did, in fact, take both those vessels out to Bombay, and they did an eighty hours' test of each?

A.—Yes.

Q.—In your letter of 25th July you had stated that you would be satisfied with a test on the Clyde?

A.—Yes.

Q.—Mr. McMurray has told us a very singular story. He says that when you had your interview in August at Renfrew you re-opened this whole question about a test on the Clyde, and pressed very hard for a test at Bombay; is that true?

A.—No, I never pressed for a test at Bombay. I mentioned it, as you may say, *en passant*: "Give us a test at Bombay," but it was instantly rejected. I never regarded it as serious. I was quite satisfied with the test on the Clyde. I never wished a test at Bombay. It never seriously entered into my mind that I should get a test there. I have had dredgers before, and I have never wanted a test for the dredgers on the spot; it is unusual.

Q.—Mr. McMurray has told us in evidence that extends over two or three pages that there was quite a considerable discussion about this matter at Renfrew. He says at Renfrew again you re-opened it, and you did want a test on the site; they were emphatic, and they would not give you a test on the site, would they?

A.—I remember some discussion about a guarantee, but I certainly never pressed for a builders' trial in Bombay. All the dredgers with which I have ever had to do, or about which I have had knowledge, were tested in the neighbourhood of the builders' yard. I am told that the Bombay Port Trust specified for some sort of guarantee in Bombay, but that is, I think, a unique case; at all events, I was satisfied with delivery in Bombay, and trials on the Clyde, and that is the usual procedure.

Q.—The only point I want to make is this: Mr. McMurray, to your knowledge, understood Bombay conditions, did he not?

A.—Yes.

Q.—When he refused to have anything to do with a trial at the site at Bombay did not that make you a little suspicious or doubtful?

A.—Not at all.

Q.—It would be only a question of money, would it not? The dredger and plant cost £655,000?

A.—Yes.

Q.—You could have said to Mr. McMurray: "We want a trial at Bombay. What is your price for a trial at Bombay?" They were going to work her out to Bombay?

A.—Yes.

Q.—Why should not they test her out there? It can be nothing more than money, can it?

A.—There are plenty of places in the world with analogous cases where they did not want to have guarantees. It never occurred to me as necessary, and I still think it was not necessary.

Q.—The under-current in Mr. McMurray's evidence, which can be brought out with a little care is that Mr. McMurray was going to give you no test in Bombay Harbour, because he knew perfectly well that he had come across clay in Bombay Harbour which the "Sir George Lloyd" might cut at only 500 cubic yards per hour. Between now and Monday will you look into Mr. McMurray's evidence?

A.—I will read Mr. McMurray's evidence.

Q.—That is a matter with which I think you ought to deal. Mr. McMurray was almost cynical about the matter, and he was not prepared, under any conditions, to give you a test at Bombay because he knew the conditions of Bombay, and the capabilities of the "Sir George Lloyd." If you will look at the evidence between now and Monday we will go through those passages, and see if we can make that point good.

A.—If Mr. McMurray thought that his dredger was going to dredge in strata No. 3 of course he knew it would not give the output.

Q.—If it was going to dredge under ordinary dredging conditions the material which would be found in Bombay Harbour, as distinguished from Sewri?

A.—We have already got Mr. Kidd's evidence who, presumably, knows a great deal more about the material than Mr. McMurray. Mr. Kidd tells us as a fact that the material is exactly the same in the Harbour as it is at Sewri. After all, you must attach some importance to Mr. Kidd's evidence. He was out there for a number of years. Mr. Kidd tell us, in substance, that he satisfied himself that the material is the same at Sewri as it is in the Harbour, and the same as in the Marine Dockyard.

Q.—As far as you remember, were the words "soft clay" first used in the document of 12th September, that is the letter attached to the Report? You had said "clay" on 25th July?

A.—Yes.

Q.—"Soft clay" are the words used by Messrs. Simons & Co.?

A.—Yes.

Q.—You had asked other firms for tenders, had you not?

A.—No, I asked other firms afterwards.

Q.—Was that in 1920?
A.—That was in 1920.

Q.—Messrs. Lobnitz?
A.—Yes.

Q.—Messrs. Ferguson?
A.—Yes.

Q.—Messrs. Fleming?
A.—Yes, Messrs. Fleming and Messrs. Ferguson.

Q.—Do you remember whether, in writing to them, or sending them any particulars, you described the clay as stiff, or hard, or soft?
A.—As a matter of fact it was not done by me. The whole of that was done by the late Mr. Meik.

Q.—He died in July, 1923?
A.—He died in July, 1923.

Q.—But still, it was your firm of Messrs. Meik & Buchanan who were under the Agreement of 7th March, 1921?
A.—Yes

Q.—Do you happen to know whether in sending any particulars to Messrs. Lobnitz, Messrs. Ferguson, or Messrs. Fleming, your firm described the clay as soft, or stiff, or hard?
A.—I do not think there is any record on that subject, because it was a matter of personal discussion with Mr. Meik, as far as I remember.

Q.—Have you looked through the documents lately to satisfy yourself about that?
A.—I have, and I will look again.

Q.—I suggest to you that in correspondence with Messrs. Lobnitz, your firm definitely stated that the material was soft clay?
A.—In that case it was a right designation.

Q.—Did Messrs. Lobnitz, in reply, state that the output of the dredgers that they proposed to specify, whilst being 2,000 cubic yards per hour in soft clay, would not do 2,000 cubic yards per hour in harder material?
A.—If they did, they said the truth undoubtedly. Of course, with a dredger specified to do 2,000 cubic yards in soft clay, no one would expect it to do 2,000 cubic yards in *that* material, for instance. (*Indicating sample of hard clay*).

Q.—I have not referred you to the documents. You took exception to producing the tenders?
A.—We do not usually do that.

Q.—It does not matter, because we have got all the documents from Messrs. Lobnitz, Messrs. Ferguson, and Messrs. Fleming. We have got them here.
A.—Yes.

Q.—I am right in thinking, am I not, that in your Report you approved of the description of the clay as given by Mr. Kidd?
A.—I did, yes.

Q.—In terms?
A.—In terms.

Q.—As stiff?
A.—As stiff clay; stiff clay, that is stiff unctuous clay, in which the "Jinga" did such extraordinarily good work.

Q.—The suction dredging pumping horse-power of the "Sir George Lloyd" was 3,000 horse-power, was it not?
A.—I think it was 3,500.

Q.—I suggest to you that it is 3,000?
A.—3,000.

Q.—On a matter such as horse-power may not Mr. Kidd be regarded reasonably as an expert?
A.—I have no information about that; I could not say.

Q.—Mr. Kidd, when giving evidence, was reading out certain items to show how he arrived at 325·23 lakhs?
A.—Yes.

Q.—At page 42 of Mr. Kidd's evidence he was asked: "The total cost of the dredging plant supplied for the Back Bay reclamation was about £855,000"; that is including, of course, the purchase of the "Kalu" and the "Jinga"?
A.—Yes.

Q.—" Can you give me any idea of the amount included in your estimate for plant? —(A.) I think I can. I have carefully kept my original estimate book.—(Q.) I want you to include the pipe lines.—(A.) Perhaps you would like me to run over the items? —(Q.) Yes, if you will. I will put them down if you will call them out." Then Mr. Kidd had a very old book with him. This was the original estimate book?

A.—Yes.

Q.—He said: " (A.) Pump filling, plant delivered and erected at Bombay; a dredger of 7,500 horse-power." At that he was interrupted, and the assertion was made: " That is two-and-a-half times the horse-power of the dredger sent out there." Then Mr. Kidd made a most expressive gesture, and he said: " Your difficulties are explained." Mr. Kidd's view was very definite that a dredger of the horse-power of 3,000 could not deal with the clay in Bombay Harbour, as he knew it to exist. What do you say about that?

A.—What I say about it is this: " Mr. Kidd's dredger was an American dredger. It was an American dredger of 7,500 horse-power. I am not speaking as a fact, but I rather think that if you investigated it you would find that, in the case of an American dredger, they add up all the horse-power together, the horse-power on the cutter, and the horse-power on the pumps. The total horse-power of the vessel is 7,500, whereas in the " Sir George Lloyd " the horse-power was only on the pumps.

Q.—Surely Mr. Kidd, when he spoke of 7,500 horse-power, meant on the pumps?

A.—I would like to know what Mr. Kidd meant.

Q.—At the bottom of page 43 Mr. Kidd was asked: " There is one thing to be noticed, and that is that your plant in 1912 gave two-and-a-half times the horse-power of the ' Sir George Lloyd '?—(A.) Quite so. That is a very important point." It was obvious that the question was with regard to the suction-dredging power, and not the propelling power?

A.—I think, if you were really to get the facts of that, you would find it was as I state, that it was not 7,500 horse-power on the pumps. The American practice is to combine all the horse-power together. That is my impression. My impression is that it is not 7,500 horse-power on the pumps.

Q.—Do you know the indicated horse-power of the " Sir George Lloyd "?

A.—No; I cannot remember it. I have not it in my mind.

Q.—In connection with the actual ordering of the dredger, you and Sir John Biles were jointly responsible for it?

A.—Yes.

Q.—Before accepting Simons' offer of 12th September, did you ever discuss with Sir John Biles the fact that Mr. Kidd had spoken of the clay as stiff clay?

A.—No; never.

Q.—Did Sir John Biles have your report before him?

A.—That I could not tell you.

Q.—Did you never give him a copy of the report?

A.—Never.

Q.—I ask you because the letter of 12th September was appended to your report, so all that Sir John Biles had was the letter of 12th September to begin with—Simons' offer.

A.—Really, I do not know what Sir John Biles had, because it was taken entirely out of my hands.

Q.—He said in practice the civil engineer tells him what the dredger has to do, and he tries to produce something that will do it. Of course, there was an interview at which you and he discussed the fact that the dredger had to be built?

A.—Yes.

Q.—The question was, who was to build it?

A.—Yes.

Q.—You described to Sir John Biles the sort of work you wanted the dredger to do?

A.—Yes.

Q.—Two thousand cubic yards of clay per hour in Bombay Harbour?

A.—Yes.

Q.—Did Sir John Biles never ask you what the clay was like?

A.—No; he certainly never asked me what the clay was like.

Q.—He had before him the letter of 12th September. At page 6 of his evidence this question is put to Sir John Biles: " Suppose a buyer wanted a dredger to cut soft clay, and indicated his wish that it should be a dredger to cut soft clay, would that

dredger be different in its construction to one that another buyer ordered which was wanted to cut stiff and unctuous clay "? That is the point, you see.

A.—Yes.

Q.—" Would there be likely to be any difference in the specifications by the makers "? he is asked, and Sir John Biles says: " You mean in the case of stiff and unctuous clay instead of soft?—(Q) Yes.—(A) Yes; I think there would, but 'stiff and unctuous ' is not a very definite term.—(Q) Neither is ' soft.'—(A) No; that is quite true.—(Q) But the word ' soft ' indicates a different consistency to the word ' stiff,' does it not?—(A) Yes; I suppose you would say it is different. You want to know how you would give effect to that difference." Then he says: " Well, I do not think he would make any difference, except perhaps a little in the cutter. The result necessarily is that he could not get as much output from the stiff and unctuous clay, or he might consider that he would not get as much output as he would from soft clay."

A.—The answer to that is: Why did Mr. Kidd with the " Jinga," which is designed for soft clay, get a better output in stiff and unctuous clay than in anything else? The fact remains that stiff unctuous clay is admirably suited for a dredger designed to cut soft clay.

Q.—That was at Sewri, was it not? That was not the harbour. It was the Sewri reclamation. We will deal with that later. Then, talking still about this clay, the question put to him is: " The clay might be so stiff as actually to stop the cutter?—(A) Yes; it might be so stiff.—(Q) I think some of the witnesses have said that that hard clay was hard enough to stop the cutter." Then Sir Frederick Hopkinson says: " No witness has ever said it was pulled up by the clay, only the moorum or rock." In point of fact, the evidence in Bombay with regard to the clay was that the " Sir George Lloyd " was a thoroughly good machine which would cut through the silt, of course, and the clay, but slowed up in the moorum. That is the evidence, is it not?

A.—Yes; and I accept that. Of course, it would slow up in the moorum.

Q.—But cut through the clay?

A.—Yes.

Q.—That is No. 2 in your little plan?

A.—Yes.

Q.—Nobody in Bombay has ever suggested that the " Sir George Lloyd " cannot cut through all the clay that is in the harbour. You have noticed that, of course?

A.—I think I have noticed that.

Q.—The question is: Could she do it at the speed of 2,000 cubic yards per hour? That is the only point.

A.—Yes; in my opinion, for what it is worth, I say she can under proper conditions, and later on I hope to put the evidence by Mr. Settle before you, who personally went out to investigate the dredger at the time that I was so ill that I was not able to go.

Q.—Have you seen the report of Sir Alexander Gibb?

A.—I have seen it, but I do not think I have studied it very much.

Q.—That report would be in 1926?

A.—Yes.

Q.—He says at page 2: " The results of the dredging up to the present are most unsatisfactory, and though they may at times show some improvement, I am of opinion that even though the restrictions by the Royal Indian Marine and the Bombay Port Trust authorities were removed they are never likely to be economical; that the reason for this is the unsuitability of the dredging plant for dealing with the material as it exists, both in the harbour and in Back Bay."

A.—Well, that is Sir Alexander Gibb's opinion, but it is not mine.

Q.—We have got to take opinions, have we not, and consider them?

A.—Yes.

Q.—You have given your opinion and Sir Alexander Gibb has given his. If that is the fact, that the horse-power of the " Sir George Lloyd " is not sufficient to deliver 2,000 cubic yards of stiff clay an hour, is not that to some extent borne out by the figures from 1923 to 1926?

A.—No; I have seen no evidence to show that the " Sir George Lloyd " will not deliver the 2,000 cubic yards per hour. She has done it frequently. I think you will find that Mr. Brims in his evidence says that she has done it for a certain period. She has done that for a few weeks. If she will do it for a few weeks, she will do it for six months. I maintain that there has never been any proof whatever that the " Sir George Lloyd " will not deliver 2,200 cubic yards of soft clay per pumping hour.

Q.—Assuming that, the question is whether the " Sir George Lloyd " was working in what can fairly and properly be described as soft clay. That is the difference between the opposing sets of views?

A.—Then as I have pointed out, we have not once but several times said : " You are working in the wrong material. Get away. Get your output. Do not go digging away in the moorum."

Q.—You will let us have those letters?

A.—Yes.

Q.—I do not know of any letters where that has been said.

A.—This is a letter, dated the 15th October, 1925, from my firm to the Secretary of the Government of Bombay. I do not know whether you have seen this : " The lowness of the output of the ' Sir George Lloyd ' is in our considered opinion due to one of two causes, or probably a combination of the two : (*a*) unsuitable material; (*b*) inefficient handling of the plant. It is obvious that if the dredger is put to work in such hard material as that the cutter blades are damaged, as we understand was the case last season, or if the dredger with the booster is asked to deliver continuously through a length of pipe-line largely in excess of 10,000 feet, the output must be greatly reduced. We are, therefore, of opinion, and so informed Mr. Brims when he was here, that when the dredger is found to be working in this hard material the suction pipe should be lifted and the operations continued in the softer clay overlying the rock." Mr. Settle will confirm that from his investigations in the winter of 1925, when he was out there.

Q.—In point of fact the " Sir George Lloyd " was designed to dredge down 70 feet below low-water level?

A.—Yes.

Q.—By reason of the orders of the Royal Indian Marine the dredging was limited to 35 feet?

A.—Yes.

Q.—Is it the fact that at 35 feet you encountered moorum rock in any quantity?

A.—I do not think we ever did any dredging at all along the area prohibited by the Indian Marine. So far as I know, we have not been there.

Q.—Were you dredging at any point down to 70 feet?

A.—I cannot tell you. I have no information on that.

Q.—Was not the limitation by the Indian Marine a general limitation : " You shall not dredge anywhere below 35 feet "?

A.—No, only certain areas.

Q.—So be it. Can you explain the figures of output as I have given you, which for 1923-24 was 1,020, for 1924-25 856, and for the last year 959 per hour, instead of 2,000?

A.—I can explain it.

Q.—What is the explanation?

A.—I say if you get rid of all these people in Bombay, and are free from all Government restrictions, from all the incubus of Government control, and let somebody get hold of these dredgers, you will find an enormous difference. That is my solution. If you will pay them a bonus, you will observe a great difference. I must repeat again Mr. Kidd's remark on the enormous increase when he paid a bonus to the men he had. He said he got a better output than the Port Trust ever had. I say again and again that the dredger has never been given a proper show, and the sooner the present personnel are got rid of and the dredgers made to work properly and an incentive given to the crew and superintendents in the shape of a bonus for output, you will see the most astonishing change there.

Q.—As to the present personnel, Mr. Speirs is still the dredging master?

A.—He is still the dredging master.

Q.—Is not he an efficient dredging master? He has got a very good record?

A.—Yes, he has got a very good record; but he is getting on in years. He only went out the last time on a special medical certificate. First of all he was rejected at the India Office; and it was only by my interfering and saying : " If you do not let this man go out we shall not be able to start dredging at all " that the Indian Government gave him a sort of special licence to go out and work for a certain time; but he has not got a first-class bill of health, and he is getting on in years, and certainly I should ask him to retire.

Q.—You notice that the first year's output was 1,020 cubic yards a pumping hour; and the second year's output was 856?

A.—Yes.

Q. Does not that point to the fact that in the second year they were getting into harder material?

A.—No, they had a most extraordinary series of accidents in the second year. No one was more annoyed than myself. I happened to be out there when it was proceeding. They had one misadventure after another, and they lost a whole month at the beginning of the season. It was very difficult to lay the blame on anybody. Those were misadventures that came about, but it was nothing whatever to do with the dredger.

Q.—I do not think you quite appreciate the point. I am not giving you the volume of the year, I am giving you the average of 856 per pumping hour when the machine was actually working. Instead of doing 2,000 cubic yards, she did 856, so that it does not matter whether she worked for 50 hours, or 500 hours or 5,000 hours, the average was 856 cubic yards per pumping hour instead of 2,000. Does not that point to the fact that she was working in the second season in harder material than in the first season?

A.—As far as I can say from personal observation when I was there she was working in very much softer material in the second season than she was in the first.

Q.—We were told you were on the " Sir George Lloyd " for an hour or two occasionally. Is that about a fair description?

A.—I was on the " Sir George Lloyd " for an hour or two occasionally, but I do not think a single day passed when I did not go and look at the output the whole time I was there.

Q.—Coming from the end of the pipe?

A.—Coming from the end of the pipe; and my distinct impression is—I know I am correct—that the second year's material was considerably softer than the first year's.

Q.—Did you see at the office of the Development Directorate the soundings that were taken each day? You know the practice? We have been told that the " Sir George Lloyd " began to dredge on 8th December, 1923?

A.—Yes.

Q.—We were told on the next day it was the practice to take soundings and see what amount she had dredged from the bed of the sea. We were told that these soundings were taken every day and were sent to the Director of Development. Did you ever see those?

A.—Never.

Q.—They would have told you as an engineer at once what the position was?

A.—I do not think any regular soundings were taken; but I can bring evidence later on about that.

Q.—There is the evidence. There is a point as to why it was that Mr. Lewis, and why it was that Sir Lawless Hepper and other people did not realise at once that the dredger was not giving the guaranteed results. They have said that every day there came into the office of the Development Directorate soundings recording the workings of the previous day and that therefore anybody looking at them would be able to get a very fair idea of what the vessel was doing. Did they never show them to you?

A.—It is the very first I have ever heard of it.

Q.—Really? Did it never occur to you that in ordinary practice they would take soundings?

A.—Yes; I have often spoken to them about soundings; but I did not know that they took soundings every day. In fact, I find it hard to believe that they took soundings every day; but I will bring evidence about that point.

Q.—Did they never show you any document recording soundings?

A.—I cannot remember any document regarding soundings. I have often discussed soundings with Mr. Brims; but I do not remember any document recording soundings.

Q.—If it is the fact, as Mr. Lewis and other witnesses have said, that every day they had a record of the preceding day's work, it ought to have been known week by week approximately how the dredger was doing, ought it not?

A.—They ought to, yes. But I cannot accept that statement that they took soundings and calculations every day.

Q.—I am not saying " and calculations," I am saying that they took soundings?

A.—Well, I hope to be able to bring evidence on that point.

Q.—They may have taken soundings and the soundings may have come into the office and may have been put away?

A.—They may have been put away.

Q.—Mr. Lewis went out as Resident Engineer?

A.—Yes.

Q.—By the agreement of 7th March, 1921 (I do not know that it is important), he stood in rather a curious position to you?

A.—Is this in the statement?

Q.—No; I will go on with that in a moment, but I want to finish this. It is the 7th March, 1921. I am not going to elaborate this now, but it says " The Resident Engineer will be nominated by the firm "—that is yourselves?

A.—Yes.

Q.— ——" and will carry out the details of the work in accordance with the firm's instructions."

A.—Yes.

Q.—We will discuss what the agreement means afterwards, and if you can tell us what it means we shall be very glad; but was it not Mr. Lewis's duty to keep you informed of the progress of the work?

A.—Certainly it was his duty to keep us informed of the progress of the work.

Q.—If after the first or second or third week the dredger " Sir George Lloyd " began her working he had ascertained from soundings that she was not delivering 50 per cent. of her guaranteed output. Was it not his duty to communicate that to you at once?

A.—Yes.

Q.—In fact you were not told of it until after July of 1924?

A.—As far as I can remember we were not told of it till after July.

Q.—Now may we get back to your statement at page 31? You say that you left Bombay on the 31st May, so that in fact you spent from the 19th May to the 30th May at Bombay, and those 11 days only?

A.—That is all.

Q.—Then you mention the fact of your partnership with Mr. Meik?

A.—Yes.

Q.—I have referred to the Rangoon River Training Scheme and the appreciation with which your work was received there. At the conclusion of the Mesopotamian work you received a letter from the Government of India which said: " I am also to convey the appreciation of His Majesty's Secretary of State for India of the valuable services rendered by you in the appointment mentioned, and to say that the Government of India associate themselves with the Secretary of State's appreciation of your work. The success of our arms in Mesopotamia has been sensibly promoted by your valuable advice, great powers of organisation, and experience of the conditions of Indian ports." Then you say: " In discussing the question of dredging at Bombay between ourselves, that is the firm of Messrs. Meik & Buchanan and firms of dredger builders, we considered that we were reasonably safe on two points, namely, the area over which dredging should take place, and the precise nature of the material to be dredged." The precise nature of the material to be dredged you had been informed was stiff and unctuous clay?

A.—Yes.

Q.—" The scheme on which we are asked to report had already been definitely accepted by the Government of Bombay and had been sent to the Government of India for sanction. I cannot recall in my professional experience a single instance where more complete borings had been taken." The fact that borings had been taken, and most complete borings, lent weight and emphasis to Mr. Kidd's description of stiff and unctuous clay?

A.—Yes, soft clay, stiff and unctuous clay.

Q.—I did not quite catch that?

A.—Soft clay, stiff unctuous clay.

Q.—But Mr. Kidd's report does not contain the word " soft " clay at all?

A.—But it was soft clay.

Q.—I appreciate that. I am only on the point of Mr. Kidd's report. You have made your point perfectly clear, and we shall have to examine it. You say the clay was soft. All I am pointing out is that at the moment when you were discussing this matter with Mr. Meik and the firm of dredger builders, the only information that you had was the fact that Mr. Kidd had taken most complete borings and that he asserted that clay to be stiff and that you in your report said you agreed with Mr. Kidd as regards his description of the character of the clay?

A.—Yes, but the very method in which Mr. Kidd took his borings is sufficient proof that there could not have been on any of his borings anything very hard. The way in which he has taken his borings he would have not gone through hard.

Q.—Did you notice that Mr. Kidd said in every case he went fully 70 feet below the low water level, or got alternatively into moorum or rock?

A.—Yes.

Q.—So that he did get through in many places, as you can see in plan No. 5—he did get down to 70 feet?

A.—Yes.

Q.—By that curious method of wash boring?

A.—He could not have gone through hard with wash borings.

Q.—We do not quite know what part that (*i.e., hard clay specimen*) was in, but he has told us there were four men holding on to the pump and putting the whole of their weight on to it as it sank through the stiffer clay.

A.—Yes. If it would interest you here are three photographs of Mr. Kidd and his staff actually taking borings.

Q.—I think we can accept your statement that that clay as it is would not yield to any wash borings of the nature described by Mr. Kidd.

A.—Quite so.

Q.—That must be so. These photographs show the thing exactly as he described it. These are the men working with Mr. Kidd in 1912?

A.—Yes.

Q.—It is just as he described it. Then you refer to the letter and say: "Such a letter from a responsible Government presupposes that all questions as to the right to dredge within the area selected by Mr. Kidd had been considered and disposed of." You say this scheme had already been accepted by the Government of Bombay in 1912 who had stated in their letter to the Government that the drawings might be considered as complete working drawings. We have that letter.

A.—Yes.

Q.—The point you are making now is that such a letter from a responsible Government presupposes that all such questions as to the right to dredge within the area selected by Mr. Kidd had been considered and disposed of?

A.—Yes.

Q.—Let us discuss that for a few moments. The position was, was it not, that the Development Directorate started out with a proposal to dredge 25,000,000 cubic yards of material in which they had no proprietary right at all?

A.—Apparently they had no proprietary right, but nobody knew they had no proprietary right.

Q.—Did not anybody know of Section 28 of the Bombay Port Trust Act, which vested the whole of the bed of the sea in the Port Trust? I am implying no criticism of you naturally, but I want to get the facts out. Did nobody know that?

A.—Apparently. The Port Trust themselves were not aware of it.

Q.—They may not have been, but somebody became aware of it, did they not? It is a ludicrous situation.

A.—It is a most ludicrous situation.

Q.—On 3rd August, 1920, Lord Lloyd makes a speech in which he announced the creation of the Development Directorate. The Development Directorate solemnly propose to take 25,000,000 cubic yards of somebody else's property, and then the Port Trust and Indian Marine wake up and begin to ask questions. Then the Port Trust and Royal Indian Marine cut out of the dredging proposition over 15,500,000 cubic yards of the 25,000,000 cubic yards that were wanted for the reclamation. That is the fact, is it not?

A.—That is the fact.

Sir Frederick Hopkinson.—No, out of 75,000,000 that was available.

Chairman.—We must take the letter of Mr. Lewis's of the 31st August, 1921. If that is wrong, it must be put right.

Sir Frederick Hopkinson.—Of the portion they had selected; I agree with that.

Chairman.—Let us get it right, because it is a very curious position. This is Mr. Lewis's letter on the subject. As I say again, it does not imply any criticism of you, but I only want to get the facts.

A.—Yes.

Q.—This is the letter of the 31st August, 1921, from your Resident Engineer to yourselves: "The reduction of material available due to exclusion of the area to the north of the pencil line on the chart sent by the Port Trust amounts to 8,280,450 cubic yards." The Port Trust had said: they would not allow you to come north of a certain line.

A.—Yes.

Q.—"The reduction of material if dredging is limited within the naval anchorage to 35 feet below low water of spring tides, amounts to 7,292,446 cubic yards, or, both together, 15,572,896 cubic yards." The Development Directorate were bound to obey anything the Port Trust or Indian Marine said about this matter, were they not?

A.—Yes.

Q.—Let us continue: "The amount available over the total area, down to 70 feet below mean water level is 38,094,785, which reduced by 15,572,896 cubic yards becomes 22,521,889 cubic yards. The amount of filling required is estimated at 30,126,856 cubic yards. We are therefore 7,604,967 cubic yards short."

A.—I think, if I may say a few words, it is even more extraordinary that scheme after scheme had been prepared and sent up to the Government of India for approval by the Government of Bombay before the creation of the Development Directorate, and not one single word had been said about the rights of the Port Trust.

Q.—For 20 years no one had said one word about it?

A.—For 20 years.

Q.—The Port Trust and Indian Marine may have been waiting—I think there is a letter which suggests that until some step is taken there is no need for them to intervene.

A.—I think you will see in the correspondence a letter from Mr. Lewis to myself, dated the 4th March, 1921.

Q.—What is that?

A.—It says: " One point has been brought forward not officially as yet which is interesting. It appears that the only authority which can sanction any alteration of the Port of Bombay, such as the removal of the bed of the harbour, is the Port Trust. Well, although the Back Bay scheme has been based on the pumping of the bed of the harbour since 1905, the Port Trust have never been approached on the subject. I was told by one of the Port Trust engineers that should we start dredging, his duty would be to inform the port officer and have the work stopped. I mentioned this to Hepper, who remarked that that was not going to stop the Back Bay reclamation." Then in the same letter he says: " Apparently since 1905 it has always been the idea that dredging should be done in the harbour and pumped across to Back Bay, but the Port Trust have never been officially told that such was the intention. They only discovered this a short time ago, and this is the result." Whether he means they only discovered then they had never been officially consulted, or whether they had only just discovered after 20 years what their duties were, I cannot pretend to answer.

Q.—However, eventually was the deficit of 7,000,000 cubic yards proposed to be made up by Mr. Lewis by going out and adding four strips of 250 feet, which would have given 9,000,000 cubic yards?

A.—Yes.

Q.—That, however, was found out not to be practicable, and was never done—going further out into the harbour?

A.—I do not know about that.

Sir Frederick Hopkinson.—It has been partly done now. There is no question about its practicability.

A.—There has never been any question about its practicability.

Chairman.—I did not know that that had been done.

Sir Frederick Hopkinson.—A little has been done outside the area.

Chairman.—One consequence was that further pipe-line was required on the proposal to go into Back Bay, was it not?

A.—Yes.

Q.—That pipe-line came to 28 lakhs?

A.—On the proposal of going into Back Bay.

Q.—Do you remember that when the " Kalu " was bought further pipe-line was ordered?

A.—For the " Kalu "?

Q.—Yes. One of the reasons that the " Kalu " ever went into Back Bay was because the Port Trust and the Royal Indian Marine had cut off this area, was it not?

A.—That was one reason.

Q.—We are in agreement about that. If you had had no interference by the Port Trust or the Royal Indian Marine you need never have gone into Back Bay?

A.—We never contemplated going into Back Bay at all.

Q.—When you did contemplate going into Back Bay 28 lakhs had to be spent in buying further pipe-line?

A.—Not 28 lakhs spent on the pipe-line. I think the " Kalu " and her repairs and her pipe-line, and everything else, cost 28 lakhs.

Q.—There was a very vehement discussion about this in the Legislative Council concerning the 42-inch floating pipe and shore connections as costing 28 lakhs' worth of more pipe-line than was originally intended?

A.—I would like to verify that. Twenty-eight lakhs for pipe-line alone seems to me to be a very great deal.

Sir Frederick Hopkinson.—The amount required in accordance with the original arrangement was 10,000 feet. Ultimately they bought 35,000 feet.

Chairman.—Do you recollect that? The original amount was 10,000 feet?

A.—Yes; it was 10,000 feet.

Q.—Ultimately when you got the whole lot you had bought 35,000 feet, which is another 25,000?

A.—Yes.

Q.—It is put down there as an amount of 28 lakhs, and I can show you to-morrow, if you like, many pages of vehement discussion in the Legislative Council with regard to this item of 28 lakhs?

A.—Yes.

Q.—Twenty-eight lakhs is roughly £200,000?

A.—Yes; but according to my notes here I have got the purchase of the "Kalu" and pipe-line as 20 lakhs. I do not think the pipe-line alone cost 28 lakhs.

Q.—Let me go over that purchase. The "Kalu" cost £75,000?

A.—Yes.

Q.—You advised her purchase in 1919?

A.—Well, I shall say something about that—about my advising the purchase of the "Kalu."

Q.—We have got the actual text of your letter in which you suggested to the Government of India that she should not be disposed of as she might be of use in the East Colaba reclamation. That is the position, is it not?

A.—Well, there is something more than that.

Q.—Let us get it in this way. The "Kalu" was mentioned by you as a possible acquisition by the Government. Is that a formula you will agree to?

A.—No; my recollection about the "Kalu" is this. I have a distinct recollection of a conversation with Sir George Curtis in 1919 on the subject of the reclamation of East Colaba. Sir George Curtis said his pet scheme was the reclamation of East Colaba before the reclamation of Back Bay was taken up. Cotton Green was about to be removed shortly, and he thought it was imperative to use all the land at East Colaba as soon as possible. He knew the Back Bay scheme was in the ascendant, but he asked me whether I thought the "Kalu" could be made use of for East Colaba, and the two projects were to be worked concurrently. It was an unofficial conversation which took place when Sir George Curtis was showing me over East Colaba. I replied that I thought a dredger like the "Kalu" would be quite suitable for the work. A dredger was bought, but apparently without any inspection.

Q.—There was a letter written by you in September. It has been read in the proceedings of the Legislative Council?

A.—I think that letter was written after this conversation.

Q.—Have you got the letter?

A.—No; I do not seem to have the letter.

Q.—Here it is. This is a letter to Sir George Curtis dated the 24th July, 1919: "I think your Government ought to ask the Government of India not to sell the "Kalu" at present, because with new pipe-line she would do very well for reclamation on the East of the Colaba between Pilot Bunda and Sassoon Dock, which work might go on almost at once."

A.—Yes.

Q.—It is a matter of construction, but was not that a recommendation to the Government of Bombay to buy the "Kalu" for the purposes of reclamation?

A.—Yes; but certainly it did not begin on my initiative. The initiative was Sir George Curtis's, who had a very great desire to start reclaim at East Colaba, and who was not very much in favour of starting at Back Bay.

Q.—We need not mention East Colaba again because it is not within the terms of our reference. Therefore we make no point about that. The only point I am making is that it would appear from that letter written to Sir George Curtis that you were saying that the "Kalu" would do very well for reclamation?

A.—Yes.

Q.—That is the only point?

A.—I remember that letter. That letter was written with Sir George Curtis's knowledge after this conversation.

Q.—It was written to him?

A.—Yes; after this conversation that I had with him when he asked me about East Colaba.

Q.—Was I right when five minutes ago I put it that you had advised the purchase of the "Kalu"?

A.—Yes; put in that way—I had recommended it, or I had agreed to the purchase of the "Kalu."

Q.—You had recommended it?

A.—But not for Back Bay.

Q.—But for reclamation?

A.—For reclamation purposes.

Q.—As a suction dredger?
A.—As a suction dredger.

Q.—That is good enough.
A.—But I certainly had nothing to do with the inspection.

Q.—I am going to follow that up. Did you know the condition she was in?
A.—I had not the faintest idea. Naturally, I did not suppose anyone was going to buy a pig in a poke, and buy a thing without inspecting it.

Q.—Therefore, your letter to Sir George Curtis ought to be read with the understanding that the Government should acquire her if she was reasonably fit for the purpose of reclamation?
A.—Certainly.

Q.—Your letter said that she would do very well for reclamation.
A.—Well, a dredger of that type, on the supposition that she was in a good condition, would have done very well for the East Colaba reclamation. You could not want a better dredger for the East Colaba, but that letter was no guarantee that the dredger was in proper working order.

Q.—You used the " Kalu " in Mesopotamia, did you not?
A.—No.

Q.—Did you not have the " Kalu " over there?
A.—The " Kalu " was over there. The " Jinga " and the " Kalu " were taken up to Mesopotamia by the Royal Indian Marine. When I arrived in Mesopotamia I found the " Jinga " and the " Kalu " there. They had done no work at all, and the obvious reason that they could not do any work was that they drew about 12 feet of water, and they had been taken up to dredge a channel where there was only three feet of water, and sometimes no water at all. They could not cut their own flotation and so they did no work at all. They never even turned their engines in Mesopotamia. The pontoons were taken away and used for military purposes, bridges, and in due course the " Jinga " and " Kalu " having remained in Mesopotamia doing nothing for a year or two, returned to Bombay. That is the history.

Q.—Then they were bought by the Government of Bombay, and the " Kalu " remained idle for five years, did she not?
A.—I do not know how long she remained idle.

Q.—I will give you the figures in a minute. The Government of Bombay in November, 1920, agreed to pay £75,000 for her. You have heard of that figure?
A.—I heard that, but I was not consulted.

Q.—I am only asking you about the figure.
A.—Yes; I heard that.

Q.—In point of fact, did she do a single stroke of work until 1925?
A.—I think that is quite probably correct.

Q.—Interest at 6 per cent. on £75,000 would result in a dead loss of £22,500?
A.—Yes.

Q.—When the Government had bought this vessel for £75,000 did they find she required more than £25,000 worth of repairs?
A.—I am told so.

Q.—Did you expect her to be ready for work at the end of 1923? You need not trouble your recollection; I can show you at page 32 of these reports that you evidently did.
A.—Yes.

Q.—You expected her to be ready for work at the end of 1923, but, in point of fact, the repairs to the " Kalu " were begun in May, 1923, and completed in September, 1924?
A.—Yes.

Q.—You then say: " The dredger ' Kalu ' placed in thorough repair has cost, along with her pipe line, 23 lakhs, 63,367 rupees."
A.—Yes.

Q.—Roughly, £180,000?
A.—Yes. I remember telling Sir Lawless Hepper that I had never heard of anything more disgraceful, and that a new dredger could have been purchased for less than the money that had been spent on the repairs, almost.

Q.—Did you recommend that she should go into Back Bay to dredge?
A.—The " Kalu " was bought specially for East Colaba. They did not carry out the East Colaba scheme, and so it was thrown into the Development Directorate scheme.

Q.—But you were in possession of the " Kalu " and in possession of the pipe line?
A.—Yes.

Q.—Something had to be done with her. She had to be used in some way?
A.—Yes.

Q.—Did you recommend her to go into Back Bay?
A.—I did not initiate the Back Bay business.

Q.—Did you approve of her going into Back Bay? She was to work in series. I do not want to make a long story of this.

A.—Certainly I approved of doing anything to make use of her.

Q.—But did you approve of her going into Back Bay?
A.—Yes; I did approve of her going into Back Bay.

Q.—Let us see what happened when she got into Back Bay. To make that point quite certain, your firm had said in a letter of the 5th June, 1924: "'Kalu.' We adhere to our opinion that whatever the future decision respecting cables in Back Bay is "—there were certain cables laid which were going to be removed at the trifling cost of £25,000—three cables?

A.—Yes.

Q.—"Whatever the future decision respecting the cables in Back Bay is, the 'Kalu' should begin work next season in the area north of the cables and coloured pink on our drawing 3496, and in order that the work may be commenced by the 'Kalu' without any intermediate pumping station we recommend that the vessel be taken at high water to the nearest point to the new sea wall. She would go to this position at high water, and would then either dredge a hole for her flotation or float in a hole previously prepared by the 'Priestman' Grab Dredger. We have considered this matter very carefully and can see no difficulty, as when the 'Kalu' and 'Jinga' were working on the Sewri reclamation the first operation was to take the dredgers at high water and place them in a position where they had to dig their own flotation before they started work, and we understand the digging of the hole took three tides."

A.—Yes.

Q.—Though you are comparing the Sewri reclamation with the Back Bay reclamation, were not the two very different? You yourself had described Back Bay as shallow and rocky?

A.—Yes.

Q.—You could not compare the two things. In the Sewri reclamation we have had evidence it was nearly all mud and a very small proportion of clay.

A.—Yes.

Q.—If a dredger was caught in Sewri with a receding tide all she did was to sit down and nothing happened; but if the dredger was caught in the shallow Back Bay what would happen would be that she would become a wreck. That is the evidence. The two bottoms at Sewri and Back Bay in the evidence have been said to be completely different. What do you say to that?

A.—I would like to draw your attention to page 102 of my statement which shows how going to Back Bay was initiated.

Q.—Would you first answer my question as to whether comparing the bed of the sea at Sewri with the bed of the sea at Back Bay was a fair comparison?

A.—Not for the whole of Back Bay or for the whole of Sewri; but if you went and found a particular place in Back Bay where you could put your dredger you would do it; but I think in this letter we gave alternatives. We said they were to do one thing or the other.

Q.—As a matter of fact, you had said in that letter that at Sewri the dredger dug her own flotation in three tides?

A.—Yes.

Q.—Do you know that the "Kalu" was dodging in and out of Back Bay, going in when there was sufficient water on a rising tide under her keel to carry her in, and coming out before the water receded so that she would not lie on the rocks; and do you know that it took her the whole season before she made her own flotation?

A.—I do; and anything more disgraceful I have never heard of in my life.

Q.—Then let us follow it through.: I am taking this from one of your reports. Is this the fact: that she worked for an hour or two each day? She went in on the 28th November for an hour or two and kept that up till the 1st December—that is, three days?

A.—Yes.

Q.—She then had to stop because of the neap tide?
A.—Yes.

Q.—She started again on the 10th December and continued till the 14th December, and then she had to stop?

A.—Yes.

Q.—That is how it went on all the season through?
A.—Yes; it went on all the season through—I quite agree with you.

Q.—Were you there?
A.—I was there for part of the time.

Q.—What did you say about it?
A.—What did I say? What could I say?

Q.—You could say: "Stop it," could you not? Could not you have said: "Stop it"?

A.—It is very difficult to say "Stop it." I do not suppose there was a single day when I did not ask Mr. Brims about it, and he always said: "Well, we are just going to do it next tide," and so it went on day by day—"we are just going to do it next tide." Then I left Bombay; but in point of fact, I think they made a mistake in their borings. The borings in Back Bay on which our desire to go to Back Bay was founded were found afterwards to be quite inaccurate. Here is a letter from Mr. Lewis dated 7th May, 1923, in which he wishes to take the whole of the dredging from Back Bay. It is a letter from Mr. Lewis to my firm: "I send herewith the final results of the boring in areas 'A' in Back Bay." Then he goes on and says that the total volume required for the Back Bay reclamation is 25,000,000 cubic yards "so that there should be ample material available in Back Bay for the whole of the reclamation. The material is decidedly good. Even the worst material is a sandy clay which dries out very rapidly and would therefore seem very suitable for filling, much more so than the material we are likely to get in the harbour. The use of the Back Bay material would therefore seem to be clearly indicated." I understand that since I was in Bombay they have found that the borings were quite unreliable, and that they had not got sandy clay in Back Bay. When the "Kalu" was performing this laborious operation of going in every afternoon and back again the next day, it was on the supposition that there was some softish material, but really there was rock there. Later on I will return to that subject again. I have evidence which will be given you by Mr. Settle, because he was there after the date I was there.

Q.—Were you there for two or three months at the period when the "Kalu" was working?

A.—I was there, I think, for about two months.

Q.—I do not understand this. After all, you were looking out over Back Bay; you would see the "Kalu" going in, staying there for a couple of hours, and coming out again, a vessel costing £200,000, with the crew on board. Why did not you take some very drastic step about it? It must have been evident to you that there was a terrific waste of money going on?

A.—I do not remember exactly how many times I saw the "Kalu" doing that. Most of this I found out afterwards; but in any case I was not the Executive.

Q.—No, you were not, but you were the technical adviser to the Government, and you were in Bombay to supervise the work. You were there for two months while the "Kalu" was piling up an enormous cost against the enterprise, and I ask you why you did not intervene and stop it? You had recommended it to go into the Back Bay.

A.—I will find the exact date, but I certainly did not watch the "Kalu" for several months doing this; I was not there long enought for that; but I will give you the exact date.

Q.—Can you give me the date in 1924 when you arrived in Bombay?
A.—Yes.

Q.—Then we can follow it up. The "Kalu" started working on the 28th November, and was carrying on through the season. Would you be there during two months of that period?

A.—Did you say she started in November?

Q.—She started on the 28th November—that is, six weeks after the monsoon. I think you arrived on the 24th November of that year?

A.—I left on the 7th January.

Q.—You arrived on the 24th November and left on the 7th January?
A.—Yes.

Q.—The "Kalu" began these performances on the 28th November?
A.—Yes.

Q.—We now know what the result was. The result of that season's work was that in 10 weeks' work she gave less than nine hours of her guaranteed output. I am not sure that I have put that correctly. Sir Frederick Hopkinson tells me she did 15,400 cubic yards in the whole season, that is less than eight hours' work according to her guaranteed output; the result was that the amount reclaimed cost 15½ rupees per cubic yard.

A.—I quite understand that.

Q.—That is 31 times your figure of eight annas per cubic yard?
A.—Yes.

Q.—And your figure included the cost of the plant?
A.—Yes.

Q.—Whereas this figure of the cost of the " Kalu " is simply for ordinary working costs. Before we adjourn to-day I think we would like to know how it was that you, being in Bombay, allowed the " Kalu " from the 28th November down to 7th January to go on doing these ludicrous performances?

A.—Well, my explanation is that I was not the Executive. I was not in control of the works after I was told what borings they had taken. There was a chief engineer there, there was also a superintendent of dredging. On several occasions I asked them how they were going on, and they always told me that they were just on the verge of getting into it and getting her in flotation. It is very easy for a thing to go on for a considerable time under such circumstances and conditions. It is very difficult for me to go and say : " Well, you none of you know your business, you had better stop." I was not in charge of the Executive. Sir Lawless Hepper never even mentioned it to me, in fact nobody ever suggested that the dredging of the " Kalu " should stop. They all said : " Well, the borings are all right. We are just going to get on it, and then we shall go ahead."

Q.—If Mr. Lewis made a mistake in the borings, somebody let you down over that?
A.—Yes. It was not Mr. Lewis. It is on record who took the borings, but undoubtedly the borings were quite unreliable, but we did not know that the borings were unreliable.

Q.—What is the letter on which you rely as showing that the borings were satisfactory? You wrote a letter in May, but I do not appear to have that letter in my correspondence. I have an earlier one in which Mr. Lewis reports very badly about the borings in Back Bay?

A.—This particular letter is dated the 7th May, 1923 : " The material is decidedly good. Even the worst material is the sandy clay."

Q.—Mr. Lewis in his evidence was relying on a letter in which he spoke about the material in Back Bay. The only letter we have in the correspondence is an earlier one than that, which is also by him, but is condemnatory of Back Bay. No, I am wrong. This letter is out of order. It has been printed in the April correspondence instead of May, and it is on page 79, so I need not trouble you with that.

A.—I should like to say that we never initiated going to Back Bay; it was initiated by Sir Lawless Hepper and Mr. Lewis. They wanted to go to Back Bay; we did not want to go to Back Bay.

Q.—To finish off the performances of the " Kalu," not only did she do that very small volume, but do you know that she was actually turning out 225 cubic yards per hour instead of 2,000 at that period?

A.—I can believe anything about what the " Kalu " did in light of experience.

Q.—Am I right in gathering from your evidence that you do not regard that as an entirely satisfactory dredging operation?

A.—I regard that as a most unsatisfactory dredging operation. I would just draw attention to a letter from Mr. Lewis to myself dated the 20th May, 1921, in which he first of all talks about Back Bay, and says : " Hepper is quite keen on the investigation of the bottom of Back Bay." That is paragraph 131 of my statement. We always threw cold water on dredging in Back Bay. That is also on record.

Q.—You say on the 22nd June : " We have always held the view that there is so much rock in Back Bay, and in very many cases near the surface, that it would be quite impracticable to use a suction cutter dredger on a large scale "?

A.—Yes. Then we got a number of borings taken, and apparently taken reliably. We got a report from the Chief Engineer telling us how delighted he is with Back Bay, how it is fine, sandy clay, and how there is enough material really in Back Bay to reclaim the whole of the area. We were very sceptical. We said : " We do not believe this, and you cannot go and alter the whole plan of operations and think you are going to get everything from Back Bay." So matters proceeded; but the Chief Engineer was so enamoured of Back Bay that he seriously proposed to his Director that we should concentrate on Back Bay. I have heard since about the borings, and I really have serious doubts as to whether the borings were taken. They are absolutely unreliable. Still, you have the Chief Engineer, a man of responsibility, who comes and says : " Look here, here are all these borings; here are 25,000,000 yards of most suitable material for this dredger, and a nice sandy clay."

Q.—I think we now understand the circumstances under which the " Kalu " went into Back Bay, and I am much obliged to you for your explanation.

A.—Thank you.

Sir H. Courthope-Munroe.—We have heard nothing about the samples which have been produced.

Chairman.—Would you like to say something about them?

A.—I would like to say something about this stiff unctuous clay. (*The witness held up a glass in his hand containing some substance in water.*) This is stiff unctuous clay after it has been for, shall we say, half-an-hour in a glass of water. There it is. That is just what describes it—it is stiff unctuous clay, thoroughly suitable for a dredger designed for soft clay.

Q.—But as the dredger cuts it it is cutting a closely compacted material?

A.—You may take it from me that the material is naturally harder than this; the material when the dredger cuts it is very like a cheese; it could not be anything else.

Q.—Does it come out at the discharge end of the pipe in that fashion?

A.—It comes out at the discharge end of the pipe like that. It is rolled round and round as it comes out. It comes out sometimes in balls, balls of clay that you can squeeze like that. I should call it stiff clay but soft clay. Many times I have been to the end of the pipe-line and taken out the balls and you can squeeze them together. Here it is after a little water has been added.

Q.—That is the sample brought from Bombay?

A.—Yes. But now I would like you to see a piece of this material. This is as it comes out of the dredger. I have seen this material coming out of the dredger. This is the way it comes out of the dredger. It is all melted up. The cutter of the "Sir George Lloyd" cuts off the material perfectly, but because it is so hard it does not get along the pipe-line at the rate of 2,000 cubic yards an hour.

Q.—It does not cut it at such a rate, but it can get it along?

A.—No, it can cut it at that rate.

Q.—Surely it is the cutting quite as much as the friction through the pipe that reduces the rate?

A.—No, I should say the "Sir George Lloyd" could cut this all right.

Q.—Could cut it at such a rate as would deliver 2,000 cubic yards?

A.—Yes; you can see it here yourself.

Sir Frederick Hopkinson.—There is nothing unusual about all this.

Chairman.—This No. 2 is stiff unctuous clay. The other is the clay from No. 3 on the sketch of Sir George Buchanan.

(*Adjourned to to-morrow morning at* 11 *o'clock.*)

The Committee Assembled at 11 a.m. on the 29th October, 1926, all the Members being present.

Sir George Buchanan, re-called and further examined.

Chairman.—Have you got a piece of that grey material which you handed in yesterday—the clay?

A.—I do not know whether it is here, but it is available.

Q.—Might we have a piece of it? Will the gentleman produce it? (*The material was produced.*) Who is going to prove that, Sir George?

A.—Mr. Settle.

Q.—Yesterday you mentioned that Mr. Kidd had spoken of the clay as soft clay. On Page 61 of his typed evidence I find the following passages:—"(Q.) As far as your information, your survey and your borings go, can you say that the material in the harbour is soft clay and not hard clay?—(A.) I have never described it as soft clay. I do not agree that it is hard clay, but I have never described it as soft clay. (Q.) You described it as stiff clay?—(A.) Stiff and unctuous." Then the questions go on to the dredger.

A.—May I make any remarks now?

Q.—I was just going to give you this last question, and then invite your answer. Mr. Billimoria says, "Therefore, if they"—that is, the dredger builders—"were supplied with a specification to build a dredger for soft clay, that dredger could not be expected to get out hard clay." Then Mr. Kidd makes this answer—"Or even stiff clay. (Q.) In that respect, therefore, the specifications would be absolutely incorrect? —(A.) If the specifications said it was soft clay, they were absolutely incorrect." That is Mr. Kidd. Now, Sir George, would you deal with that. Would you like to have the quotations before you? (*Handing document to witness.*)

A.—Well, Mr. Chairman, I tried yesterday to convince you that there was nothing inconsistent in a stiff material being a soft material, and I must emphasise that. I maintain that Mr. Kidd's stiff unctuous clay is soft clay, and it is not capable of any other interpretation. I may say that " stiff unctuous clay " is a nomenclature invented by Mr. Kidd, because I have never before heard of any material called stiff unctuous clay. Let us just analyse the word " stiff " for a moment. I have been puzzling about this, Mr. Chairman, since we left last evening, and I have looked up the word in the dictionary, and I also looked it up in Mrs. Beeton's cookery book. Now, " stiff " as regards paste. You have a stiff paste. Mrs. Beeton's cookery book says, " Rub the butter into the flour, add the sugar and mix the whole into a stiff paste." You also have a stiff jelly, but it does not mean it is hard. In the Oxford dictionary it says, moist clay, batter, etc., thick and viscous, not fluid, in or approaching the plastic state. I assert most positively, Mr. Chairman, that " stiff and unctuous clay," which, as I say, is a name invented by Mr. Kidd, is soft clay for all practical purposes, and nothing will induce me to express any other opinion.

Q.—Then, in your view, when you are dealing with clay as a substance, " stiff " and " soft " are interchangeable terms. Is that it?

A.—I would not go so far as that.

Q.—Does it mean that it does not matter which word you use; whether you say the clay is stiff or the clay is soft, both are correct?

A.—As regards the material we are discussing, it does not matter whether you say " stiff " or whether you say " soft." I say you can use one or the other. After all, there are many words in the language, and some of us use one word and some use other words. I maintain that it is soft clay.

Q.—We were dealing with the " Kalu " when we left off last night, and we were on the question of cost. I just want one more figure from you. We know from the cost accounts which have been taken out that that season's working of the " Kalu " cost in wages and fuel and stores and sundries and things of that kind, 2 lakhs 42571 rupees. That is roughly £18,000, is it not?

A.—Yes.

Q.—That emphasises your criticism, does it not, that this was a terrible waste of money?

A.—It does, yes.

Q.—Had you ever hoped that the " Kalu " would go into Back Bay and settle down on the sea bed?

A.—On the borings, I do not see any reason why she should not. I would like to put in this document, Mr. Chairman. Here are the borings which were supplied to us, taken by the Executive. You will see in those borings sand and clay, soft clay, sand and soft clay, sand and soft clay, sand and soft clay, sand and soft clay. In every instance there is sand and soft clay. No. 1 is 9 ft. 6 ins. of sand and clay.

Sir H. Courthope Munroe.—Had not you better give a copy of that to the Committee, Sir George? *

A.—This is the only copy I have. On these borings I saw no reason at all why the "Kalu " should not go in. It now appears that these borings are absolutely incorrect. We had a letter from the chief engineer saying : " The material is decidedly good. Even the worst material is a sandy clay." When they put the " Kalu " in apparently there was no sandy clay. Apparently they got on to some hard material. The borings were incorrect.

Chairman.—The material which they got into was very stiff?

A.—Very stiff, yes, but they never told me that.

Q.—In fact, the material into which they got is described by you at Page 35 of your report of 1924 as follows : " The material met with has proved to be very stiff "?

A.—Yes, but it was not, according to these borings.

Q.—Originally you had disbelieved in the policy of sending a dredger in to work in Back Bay, had you not?

A.—I was never enthusiastic about Back Bay at all.

Q.—You had expressed an opinion against sending a dredger in to work into Back Bay, had you not?

A.—I had, yes.

Q.—I want to get the history of this. Then you got those borings which you have just read to us?

A.—Yes.

Q.—And, on the assumption that those borings are correct, you alter your opinion?

A.—I alter my opinion, yes.

Q.—Then the " Kalu " goes into Back Bay with disastrous results?

A.—With disastrous results.

---

* Copy handed in. See Appendix VII.

Q.—I pass from that, and come back for a moment to the limitation of area by the Port Trust and the Royal Indian Marine. I gather the reason why you never discussed the question of dredging either with the Port Trust or with the Royal Indian Marine was because from the documents you assumed that the matter had been settled between the Government of Bombay and the Port Trust?

A.—Yes.

Q.—Or at all events you may have assumed that the Government were the paramount power, and that if they wanted to dredge in Back Bay they would do so. It was one or other of those considerations?

A.—Yes. It never occurred to me for one moment ——

Q.—What did occur to you, Sir George?

A.—What occurred to me was, as you say, that arrangements had been made.

Q.—If arrangements were necessary, they had been made; if they were not necessary the Government, as the paramount power, would order the work to be done?

A.—Yes. I will give you one instance——

Q.—You need not do so.

A.—I would like to give you an example of another case. The reclamation works extended in front of a long row of buildings called Marine Parade. I raised the question with Sir Lawless Hepper. I said, " Have these people got no rights? Suppose you build your wall in front of them, and fill up, and build new buildings on the reclaimed land, what about these people's rights? Have you looked into it "? I have had experience of that kind of thing, and I know it is a matter of common knowledge that if you interfere with a person's approach to foreshore rights you get into trouble. I do not even know now whether that matter has been squared up.

Q.—But it never occurred to you (I am not putting it by way of criticism at all) to ask anybody whether the Port Trust and the Royal Indian Marine would raise any objection to the dredging?

A.—Never. For 20 years they had been discussing it.

Q.—But I suppose you will agree that, the bed of the sea being vested in the Port Trust, it was somebody's duty before announcing the decision, to have put that matter right?

A.—The Government is the paramount power, is it not?

Q.—Is it, with regard to the Port Trust who, by Act of Parliament, have this bed of the sea vested in them?

A.—It is not a matter I can discuss, Mr. Chairman.

Q.—I am asking you just generally. Does it not occur to you that, if that were the position, somebody clearly ought to have made it perfectly certain that the Port Trust would not intervene?

A.—Would not intervene. Sir Lawless Hepper, when it was pointed out to him (it is in my statement) said, " At all events it is not going to stop the Back Bay reclamation schemes."

Q.—I am sorry to take this matter piecemeal, but a passage has just been pointed out to me which I have overlooked. This is Sir Lawless Hepper's extract from your report to Government, dated 15th December, 1924. Indeed it was the passage I was, reading from a minute ago. Let us get it from that little book, the reports of Sir George Buchanan, page 37 at the top, " The ' Sir George Lloyd ' and ' Colaba ' were designed to discharge 2,000 cubic yards of soft clay per hour through 10,000 feet of 42-inch pipes. Last season the material actually dealt with was not soft clay, but silt and stiff clay." Are you not there drawing a clear distinction between soft clay and stiff clay?

A.—I must again point to my little sketch which I made yesterday. I think I said several times yesterday that the dredger in the first season was working in the third layer. That is what the stiff clay refers to. It was working in the third layer, and we have since instructed them to get out of that layer.

Q.—That does not really quite meet my question, which was: " Are you not, in that passage, contrasting soft clay and stiff clay as if they were two different matters? Will you take this copy of the document? (*Handing same to Witness.*) It is at the top of page 37. That is the only question I am asking you. The way in which you put it is " was not soft clay but stiff clay."

A.—It is very difficult for me, Mr. Chairman, years afterwards to analyse actual words. " Silt and stiff clay, with some sand and stones."

Q.—You do appreciate that I am trying to get from you everything you would wish to say? You have read, have you not, hundreds of documents such as engineering reports?

A.—Yes.

Q.—You are as familiar with them as you could possibly be. Just detach yourself from this case for a moment and imagine that you are reading that as the report of some eminent engineer. You see that he says, "The material actually dealt with was not soft clay but stiff clay." Would you not, in your own mind, consider that there was a difference in consistency, in specific gravity, and in density between the soft clay and the stiff clay?

A.—If you analyse these sentences, I agree; but I state facts. I say, irrespective of analysing these words, that you have silt; you have soft and stiff clay; stiff, unctuous clay and soft clay, and you have clay and sand and stones. If I was writing this again to-day, or if I had thought when I had written this, "Now, let me see, this is going to be analysed in several years time," I should certainly have written it differently. If you want my real candid statement it is that notwithstanding anything which is written, I happen to know what the material is: there is silt at the top; then there is stiff unctuous clay, which I will always say is soft clay, and then you get on to the moorum and clay and stones, such as we had a specimen of on this table last night.

Q.—Had the result, up to the 14th February, 1924, of the pumping operations in the harbour been satisfactory in your opinion?

A.—No. I could not call them satisfactory. You could not call them satisfactory.

Q.—It was obvious that, for the many reasons which you have given, the dredger was not giving her output?

A.—That is right, yes.

Q.—In your statement of 11th February, 1924, at the top of page 26, you say, "I believe I may say that the result up to date has been quite satisfactory." What about that?

A.—You must remember, Mr. Chairman, (I think I am right in saying it) that there had been no measurements taken then.

Q.—Just consider. Mr. Lewis was the gentleman sent out by you, and very highly recommended. Mr. Speirs was the dredging master. Mr. Lewis had said that every day the result of the previous day's soundings came into the office. Mr. Lewis must have known?

A.—He must have known, but he certainly did not——

Q.—But, as technical adviser and supervisor, ought not you to have extracted from Mr. Lewis exact information?

A.—This sentence says: "I believe I may say that the result up to date has been quite satisfactory. The material in the harbour has proved much harder than we were led to suppose. Actual reclaimed land can be seen and walked upon by anyone who chooses to go to Colaba." Taking that as a sentence, that is what we all believed. We were always talking about actual reclamation. I do not see anything inconsistent in it. When this was written, Sir Lawless Hepper, and all of us, thought it was satisfactory. The material in the harbour was good, and the actual reclaimed land could be seen. I maintain that it was not until much later that, by measurements, they found out what they had been doing per hour.

Q.—But they could unquestionably have found out on the 10th December, 1923, what the dredger had done on the 8th December, and similarly every other working day of that season?

A.—Well, they certainly did not.

Q.—I think you are right there, Sir George. Mr. Lewis could not tell us that in fact he had investigated the results of the soundings. That passage says: "I believe I may say that the result up to date." The result, surely, must include output?

A.—No. The idea at that time was to reclaim land. We were all obsessed with the idea that the silt would be full of water, and so on. I remember going with Sir Lawless Hepper and Mr. Lewis and others, and everyone was very pleased indeed with the land which was being reclaimed.

Q.—But surely the result that was promised to the people of Bombay was the reclamation of 1,145 acres in five years from the commencement of the pumping? That was the result promised was it not?

A.—That was the result.

Q.—When you use the phrase, "I believe I may say that the result up to date has proved quite satisfactory," would not anybody reading that be led to think that the output, as well as the quality, of the material were satisfactory?

A.—Well, all I can say is that when this was written we were all satisfied. Sir Lawless Hepper went over this report with me. He made no comment.

Q.—Have you read the reports of the Development Directorate?

A.—I cannot say that I have read them.

Q.—They make very curious reading, do they not?

A.—There are so many reports. I have not read them.

Q.—Sir Lawless Hepper has had to admit that every report of the Development Directorate dealing with this scheme has had material omissions?

A.—I had nothing to do with that.

Q.—You had nothing to do with that; Sir Lawless Hepper has taken on himself the whole responsibility for the authorship of those reports; but those reports, with the evidence as given by him, show there were designed omissions, and omissions which could only have been intended to mislead the public. You had no responsibility for them, and your reports, if I may say so, are in very different terms.

A.—I said yesterday, Mr. Chairman, that I would produce a letter showing the difficulty which we had in getting double shift. This is a letter from the Chief Engineer, Back Bay Reclamation Scheme, to the Secretary to Government, Development Department: "I forward herewith a copy of a telegram received from Messrs. Meik and Buchanan for information: 'Anxious about dredging. Have you made arrangements for complete staff for working double shift on all dredgers?' I would refer to my numbers 2432 of 30th June, 1924, 2672 of 22nd July, 1924, and 2673 of 22nd July, 1924, asking for arrangements to be made for the engagement of officers to complete the staff required, and would again point out urgency of immediate action being taken if the services of these men are to be obtained in time for the commencement of the dredging season."

Q.—What date is that telegram, Sir George?

A.—The telegram is not dated, but the date of the letter is the 24th July, 1924.

Q.—Was one of the minor difficulties encountered the inability of the anchors and insufficiency of the anchors to keep the pipe-line straight?

A.—Yes, it was. It was a minor difficulty.

Q.—In point of fact, did the specification provide for one anchor of 7 cwt. for every four or five pontoons?

A.—I have not got the specification, but if you say so I will accept it.

Q.—I am taking it from the evidence. If you would like to check it, the reference is at page 12, line 6. Perhaps I had better read it to you. This is the evidence of Sir Lawless Hepper. He is being asked about the output of the dredger, and he is being shown that the addition of the figures for the first two seasons still gives a less figure than one working season; and of course he has to accept that. "(Q.) Then there must have been, both in 1923 and 1924, considerable interruptions and delays? —(A.) In 1923/24 the dredger did not commence until the 8th December, and then immediately after commencement there was bad weather, and considerable damage was done to the pipe-line. Throughout the season we had trouble, because the anchors that had been supplied for holding the pipe-line were not heavy enough, and the tides were very strong, and the pipe-line was continually getting out of position and breaking. It was not until we got a complete new set of heavy anchors that we were able to get the work going in the season." Then, at page 119, line 15, one of the technical witnesses takes up that matter. He is asked what were the various factors that combine to produce the very poor result, and he is asked to tell us all of them. It is said to him: "Is there any possibility of insufficiency of material?" and he says "In some cases. Other factors that we have to contend with are very strong tides, and this is an important factor. The difficulty especially is with the strong tide which keeps the dredger away from the face. Then there is difficulty also with the moorings of the pipe-line. They get carried away, and during the first two seasons we experienced considerable difficulty in keeping the pipe-line in position. We had to get a large number of extra anchors, the difficulty was so great. (Q.) Was that during your time?—(A.) Yes. Furthermore, to show the difficulty of holding the pipe-line in position in the original pontoons that we ordered there was one anchor allowed for every four or five pontoons, and that was absolutely useless. We have, on the later pontoons, allowed two anchors and winches to each pontoon instead of one for four or five, and even that has not proved sufficient." The gentleman who suggested one anchor of 7 cwts. for four or five pontoons must have made a miscalculation, must he not?

A.—Not necessarily, Mr. Chairman. These are all matters that are ascertained by experience. I remember discussing with Messrs. Simons & Company the question of the anchors to be put on the pontoons. In a dredger that I had worked in Burma with 5,000 feet of pipe-line, we had an anchor on each pontoon. Actually in working the dredger we found we did not want the anchors—that the pipe-line adjusted itself to the

tide. There was a strong tide, and I think we only had three or four anchors in the whole length of pipe-line. I say, Mr. Chairman, that this is a minor point in regard to which you cannot lay down any law beforehand. The man in charge of the dredging, when he found he wanted more anchors, ought to have gone round Bombay and got more anchors. What I suppose happened was the usual Government procedure. He had no power to buy an anchor. He would have to write to the Superintendent of Dredging, and he would have to write to the Chief Engineer; the Chief Engineer would have to write to Sir Lawless Hepper, and Sir Lawless Hepper, if it was within his own powers, would sanction it, but if not, it might go up to the Hon. Member. It takes a very long time to purchase necessary articles when you are working under Government control.

Q.—I am not on the question of time at all. I am on the question of insufficiency of the number of anchors and insufficiency in weight. The anchors that were supplied subsequently were 30 cwt. anchors. You had joined in the specification with Sir John Biles, had you not?

A.—Yes.

Q.—That specification provided for one anchor of 7 cwt. to four or five pontoons. In practice it was found necessary to provide two anchors and winches of 30 cwt. each to each pontoon. Was not that a serious miscalculation in the specification?

A.—No, Mr. Chairman, I cannot agree.

Q.—Was it a miscalculation?

A.—No, I cannot agree. It was the ordinary procedure. You could not tell exactly how many anchors you wanted. The specification was the usual procedure. I call it quite a minor point that they wanted more anchors when the work started—quite a minor point. As I say, all they had to do was to get some more anchors. You cannot go and lay down cut and dried rules for dredging operations of this kind.

Q.—The Port Trust, or the Royal Indian Marine, must have had people in 1919 who had a good deal of experience on the strength of the tides?

A.—No; I do not admit that they would have any knowledge of the exact strength of the tides.

Q.—Let us consider it. Between 1908 and 1913 they had done dredging operations with pipe-lines on a very large scale, had they not?

A.—Yes, at Sewri.

Q.—The people who were employed in that had the same problem as the people on the "Sir George Lloyd," namely, of getting their pipe-line in position?

A.—Yes.

Q.—Did you ever go to the Port Trust, or the Royal Indian Marine, people and ask them how they had gone on at Sewri in 1919?

A.—No. The very last people I would go to would be the Indian Marine.

Q.—Why the very last people?

A.—After the experience I had had with the Indian Marine in Mesopotamia, in connection with the dredgers "Jinga" and "Kalu," I should not be likely to go to them for any information on dredging.

Q.—Do you mean they would not give it to you, or what?

A.—No, I did not think it was of any value.

Q.—Would you have considered the experience of the Port Trust, spread over five years of dredging, of any value?

A.—I should not consider it so valuable as the experience I had obtained myself in connection with pipe-line dredgers. After all, we consulted the builders. Mr. McMurray had been actually in charge of the dredging on the "Jinga" and "Kalu." As a matter of fact I do not know what anchors they had there.

Q.—But do you think, Sir George, that the spending of 12 days in Bombay from the 19th May to the 31st May gave you sufficient time to study local conditions?

A.—Yes.

Q.—You do?

A.—It gave me ample time.

Q.—You left, however, without any personal knowledge of the quality of the material at the bed of the sea?

A.—If you mean that I did not go and dig up the material myself, you are perfectly correct.

Q.—I am merely using your own words. You have yourself said in your statement that you had no personal knowledge of the quality of the material at the bed of the sea, and this is right, is it not?

A.—That is perfectly right, Mr. Chairman, but you must qualify it by saying that if I had taken 1,000 borings I could not have obtained any more information than I had already obtained from Mr. Kidd's borings.

Q.—If you had taken 10 borings, would you not have been able to satisfy yourself whether the silt or mud, as it has been described, would make good reclamation—10 borings?

A.—No, I do not think so.

Q.—With 10 borings you could have brought up silt from various places in the harbour. That is right, is it not?

A.—Yes.

Q.—You could have had them tried out; you could have submitted them to Mr. Mitchell, or to any other expert; you could have examined them for yourself and have seen whether, in your view, the silt would make good reclamation. That could have been done, could it not?

A.—I think it would have been superfluous.

Q.—But it caused you a great deal of anxiety later, did it not?

A.—It does not cause me any anxiety now.

Q.—Did not it cause you at one time a great deal of anxiety?

A.—Certainly, it caused me anxiety at the time to know whether the silt would dry out properly.

Q.—Right through your reports, from 1922 to 1924, are not you emphasising the fact that you did not know the nature of the material and that the nature of the material never would be known until actual dredging commenced?

A.—The nature of the material now——

Q.—No, do answer the question first. Are you not, throughout your reports of 1922, 1923 and 1924, making it clear that you had no personal knowledge of the nature of the material, and that exact knowledge of that material would only come when actual dredging operations commenced?

A.—Certainly; but you must remember that I did go down and very carefully examine the reclamation at Sewri, which is the same material.

Q.—When did you do that?

A.—I did it between the 12th and 19th. I did it when I was in Bombay.

Q.—19th to the 31st, you mean?

A.—Yes, certainly.

Q.—Did you have any discussion with any representative of the Port Trust or of the Indian Marine, who was then connected with the Sewri reclamation?

A.—I had a great many discussions. I cannot remember them in detail now. I had a great many discussions with Mr. Messent, and I got a great deal of information from him.

Q.—Did you attach importance to the information he gave you?

A.—Certainly. I attached importance to the information which he gave me.

Q.—Am I right in saying that there is not any mention in your report of any conversations which you had with Mr. Messent?

A.—We do not put all those sort of things in. Why should I put it in my report?

Q.—Am I right in saying that in no correspondence which has been laid before us, or in any letter that you have ever written to the Director of Development, has it ever been mentioned that you had had interviews and discussions with Mr. Messent?

A.—No; we do not put records of the private conversations which we have.

Q.—But the point is this, Sir George. When Mr. Lewis began to raise the question about the quality of the material in the harbour, you and he had considerable correspondence about it, did you not?

A.—Yes, and I said, " At all events, it cannot be worse than at Sewri."

Q.—Would it not have been natural, when Mr. Lewis was putting forward the opinion of Mr. Mitchell, for you to have put forward the opinion of Mr. Messent, and to have said, " It is all very well, but I had endless conversations with Mr. Messent, who knew more about it than anybody else, and he assured me of the quality of the material."

A.—It was really more to the point, Mr. Chairman, if I may say so, to say, as I did say, that at all events the material cannot be any worse than it is at Sewri. I constantly looked at the material at Sewri.

Q.—Very well. I will ask you what I hope is the last question about stiff and soft clay, and it is this. Can you point to any document of any date you like made by the Development Directorate, the Government of Bombay or the Government of India—any document official or non-official—which uses the words " soft clay," before 12th September, 1919, when Messrs. Simons used the phrase?

A.—No, I cannot point to any.

Q.—I have looked through all the papers very carefully and I cannot find it either. As far as the documents before us go, and all the official reports and everything, the

very first mention which I can find of " soft clay " is in Messrs. Simons' letter of 12th September, 1919. If you can find anybody ever having described that material as " soft clay " before, it would be a very great help to the Committee?

A.—No, I cannot.

Q.—Very well. Now at page 35 of your statement we get to the point where, having completed your report, you arrived in Bombay on the 14th November, 1919?

A.—Yes.

Q.—Did you stay at Government House?

A.—I did.

Q.—For about how long?

A.—I think I was there for five or six days.

Q.—That would give you ample opportunity for discussion with Lord Lloyd?

A.—Yes.

Q,—Did you and he go over your report together?

A.—I really cannot remember that.

Q.—Even if you and he did not go over the report together, obviously you and he were discussing the substance of your report and the feasibility of the scheme.

A.—Yes.

Q.—No doubt you impressed upon Lord Lloyd the feasibility of the reclamation from an engineering point of view?

A.—Yes.

Q.—And impressed upon him also that the proposed work could be done for 367·61 lakhs?

A.—Yes, undoubtedly I must have told him that.

Q.—And that it could be done within the period stated by you in the report?

A.—Yes. I saw no difficulty at that time in completing it within that period.

Q.—Did you point out to Lord Lloyd at any of those interviews the possibility that there were difficulties ahead?

A.—No, I do not remember pointing out specifically what difficulties there were ahead, but it was generally understood, I think, that you cannot carry out any very large public work without having difficulties ahead. I think Lord Lloyd emphasised that himself.

Q.—He did?

A.—I do not think we discussed specific difficulties.

Q.—If there were 10 per cent. of delay in time and 10 per cent. of increase in cost, nobody would trouble about a thing like that, would they?

A.—Certainly not, on the figures which they expected to get at that time from the land.

Q.—But this is something a good deal more than 10 per cent. increase in time, is it not, Sir George?

A.—This is more than 10 per cent. increase in time.

Q.—And must be more than a 10 per cent. increase over your estimated cost of 367 lakhs?

A.—Yes.

Q.—On page 36 you are referring to your report : " I said that on the assumption that Mr. Kidd's borings and surveys were correct (and I saw no reason to doubt their accuracy as a great many borings had been taken), I accepted his conclusion both in respect of quality and quantity of material. In this I consider I had full justification, as I do not believe any responsible engineer in the face of such overwhelming evidence as to the nature of the material would be so foolish as to say he wished to take up another year's time (to say nothing of the expenditure involved) in making fresh investigations." That is how you put your case as regards that point, is it?

A.—Yes.

Q.—In point of fact, certainty could have been arrived at in far less than another year's time, could it not? You told us so yesterday?

A.—Certainty? No, Mr. Chairman. There was the monsoon. You could not do any boring in the monsoon.

Q.—I have been careful, if you notice, to suggest to you the date for the commencement of your borings—October, 1919. I am going now to suggest to you that it would have been prudent for you to have advised Lord Lloyd to have taken borings for a period not exceeding one month, and that if that had been done you would then have known with certainty the nature, quality and approximately the extent of the material to be dredged?

A.—I am sorry to say I do not agree, Mr. Chairman. I am perfectly satisfied.

Q.—At the bottom of page 36 you say: 'Finally I submitted plans, specifications and tenders for dredging plant by British firms; also an analysis I had prepared of the working cost of the dredgers. I modified and very considerably cheapened a section of the wall proposed by Mr. Kidd for reasons given in my report.'' Mr. Kidd had estimated that the sea wall would cost 64.22 lakhs?

A.—I will take that figure.

Q.—It is in your report; you may take it as being correct. You estimated it to cost 118.11 lakhs. At present some 1,850 feet is uncompleted?

A.—Yes.

Q.—Have you followed the evidence enough to ascertain that the cost up to the present moment is in the neighbourhood of 200 lakhs?

A.—I am quite prepared to discuss that, Mr. Chairman. Yes, I accept all those figures.

Q.—That is quite double the amount for which you said it would be done, because we have to take into account the unfinished portion?

A.—Yes.

Q.—What was the section of Mr. Kidd's wall that you considerably cheapened?

A.—As far as I remember, we adopted a rubble mound instead of concrete blocks. I cannot remember now precisely.

Q.—One object of the sea wall, of course, was to retain whatever material was pumped into it?

A.—Yes, within reason.

Q.—If the material which was pumped in was not worth retaining it was not worth pumping?—

A.—Yes.

Q.—Did your sea wall in fact retain the material?

A.—There are a number of questions involved in that. I am not prepared to answer that question without being allowed to elaborate it.

Q.—Have you any doubt, Sir George, that you are allowed to elaborate any question that you wish? Have you any doubt about that?

A.—No.

Q.—Then come along. First of all, did the sea wall in fact permit large quantities of the silt to escape through it?

A.—So I am told, yes.

Q.—Did not you see it yourself?

A.—I did not see very much of it.

Q.—Did you see any of it?

A.—I saw some of it, yes.

Q.—You saw some of it. That is the first point. The silt that was escaping through it was part of the material pumped by the "Sir George Lloyd"?

A.—Yes.

Q.—And believed to be, when you put in your report of October, 1919, good material for reclamation?

A.—Yes.

Q.—Your sea wall must have been designed to retain that material?

A.—Yes, it was.

Q.—Why did it not retain it?

A.—Well, there are certain reasons. I should think that construction had something to do with it.

Q.—Were you supervising the construction of it?

A.—No, I was not there all the time.

Q.—But you were there for two or three months each year, were you not?

A.—Each year, yes.

Q.—Is there any letter which you have ever written complaining to Mr. Lewis or to Sir Lawless Hepper or anybody, that they were building the sea wall in such a way that they were permitting the reclaimed material to escape?

A.—I shall have to look that up. There are a good many letters on the subject.*

Q.—Would you just make a note of it?

A.—I will.

Q.—As to whether you can find any memorandum or letter addressed to Mr. Lewis or to Sir Lawless Hepper or to anybody in control of the works criticising them for the way in which the sea wall was being built, and saying that in the result they would have reclaimed material passing out again into the open sea—something to that effect?

* See Appendix VIII.

A.—Yes. When we are inspecting works, Mr. Chairman, we do not always put down in writing everything we say to the engineers in charge.

Q.—Then I will put it to you in another way. Will you pledge your word that you ever complained to Sir Lawless Hepper that the wall was being built in such a way as that it permitted the escape of reclaimed material?

A.—No, if you put it exactly in those particular words.

Q.—Yes, I do.

A.—No, I do not think I did.

Q.—Or to Mr. Lewis?

A.—Or to Mr. Lewis.

Q.—I am obliged to you.

A.—Not exactly in those words.

Q.—Anything in the nature of a complaint—a complaint that they were building the wall in such a way that it permitted the material to escape. I must put that particular point for a reason which will be apparent in a moment. You had contemplated, had you not, that your sea wall would allow material to escape through into the sea?

A.—No.

Q.—The silt is carried in suspension by the sea, is it not?

A.—It is.

Q.—Did not you write a letter to Mr. Lewis saying that the sea wall would be porous for a very long time to come?

A.—Naturally it would be porous. With the sea water going in and out you cannot make a rubble wall that is absolutely water-tight at once.

Q.—Your letter of June 3rd, 1922: "In any case the sea must pass through the porous rubble wall for a long time to come," means that the sea would go on passing through it despositing silt until the time when the wall became a retaining wall? Is that right?

A.—A rubble wall is not a watertight wall. As the reclamation proceeded the instertices would be filled up by the silt and the wall would gradually——

Q.—Seal itself?

A.—Would seal itself.

Q.—That is what I was trying to put, only I did not put it in that way. The silt being carried in suspension by the sea would be deposited gradually in the interstices of the wall and eventually would seal it?

A.—Yes; it would seal it.

Q.—It did become a very expensive matter, did it not? Do you remember an interview between Sir Lawless Hepper, Mr. Lewis and yourself within one month of the commencement of the dredging? That is early in January, 1924.

A.—Yes.

Q.—Did they tell you that the silt which was being pumped was escaping through the sea wall, and could, in fact, be seen on the seaward side of the sea wall?

A.—Yes.

Q.—Did they tell you later that of 1,020 cubic yards per hour that were dredged by the "Sir George Lloyd" there was found on measurement of the reclamation only 627?

A.—Yes, they told me that afterwards.

Q.—That is a loss of nearly 40 per cent., is it not?

A.—Yes. As I said yesterday, I do not accept any of the measurements at all.

Q.—If those figures were correct, was that serious?

A.—It was undoubtedly very serious.

Q.—In the season 1924-25 did they also tell you that of 856 cubic yards per hour pumped only 452 were found to be retained in the reclamation?

A.—Yes.

Q.—That is a loss of about 55 per cent., is it not?

A.—Yes.

Q.—Did they urge upon you the desirability of sealing the sea wall with moorum?

A.—I do not think they urged it upon me. I think we urged it upon them, as far as I remember.

Q.—It has been put quite the other way. It has been put that Sir Lawless Hepper and Mr. Lewis were both very anxious that that sea wall should be sealed with a bank of moorum, and that you thought it was unnecessary. Does that accord with your recollection of the matter?

A.—It accords with my recollection at that particular time; but I should like to amplify that, if I may.

Q.—Please do; but shall I just finish the questions on this, and then I would like you to deal with that. As a matter of fact, did not Sir Lawless Hepper obtain the sanction of Government in February, 1925, to the expenditure necessary for sealing the wall, and did not they, in fact, do it between February, 1925 and September, 1925?

A.—I do not think I was there then. I believe that something did happen, but I think it was on our representations, not on theirs.

Q.—When you say " on our representations " do you mean on the representations of your firm?

A.—Yes.

Q.—If so, that is a representation that would be sent by a letter from England to India?

A.—Yes.

Q.—Would you make a note that if you have got any letter of that character we would be very much obliged if we could have it?

A.—Certainly.

Q.—The letter would be somewhere about January, 1924, and later. Perhaps I can help you a little with regard to that. Will you just take again the large volume of correspondence? (*Same handed.*) At page 106 there is a letter from Mr. Lewis to Sir George Buchanan: " Undated, but must be January, 1924," and is a reference to the interview of which you spoke: " Dear Sir,—In a discussion in Sir Lawless Hepper's room a few days ago it was suggested that the rubble mound should be lined on the inside with a layer of quarry spoil to prevent any leakage of dredged material. Would you agree to have this spoil placed in position from the present time onwards? " The answer is the 24th January, 1924, on page 107: " I am not in favour of beginning at present the lining of the rubble mound on the inside with quarry spoil." The next letter to which I would call your attention is the 15th October, 1925, paragraph 3, on page 167: According to the figures given in your letter under reply, 1,261,986 cubic yards of material were dredged from the harbour during the last season, but only 680,438 cubic yards were deposited in Back Bay. The smallness of this latter figure obviously points to a great leakage from the area under reclamation, and the advisability is indicated of tipping a watertight moorum bank alongside along the inside face of the sea wall."

A.—Yes.

Q.—You were there suggesting in October, 1925, what had been impressed upon you in January, 1924, and with which you then disagreed?

A.—Yes, apparently.

Q.—In fact at the date of this letter of October, 1925, the Development Directorate had already completed the sealing of the sea-wall on their own initiative?

A.—Well, I would not like to say it was on their own initiative.

Q.—Subject to any document you can produce, at present the case does appear as though it was on their own initiative. Do you agree with that?

A.—I agree, yes.

Q.—Is there anything on this question of the porousness of the sea-wall further that you would like to say about it that would help us?

A.—Yes.

Q.—Thank you very much.

A.—At page 107 you read two lines of my letter: " I am not in favour of beginning at present the lining of the rubble mound on the inside with quarry spoil. I believe that later on, when the reclamation towards the wall is more advanced it may be desirable to put a lining on the inside up to high-water neap tides only." If later on, when I was not there, the people who were every day looking at the work saw material going through the wall and did not take any action at all, continued looking at it and continued taking no action at all, well I do not think I have any words too strong with which to blame them.

Q.—But this must, must it not, relate back to the design of the sea-wall, which was intended to preserve and retain all that was pumped into it? Is not that the original cause of the trouble?

A.—No, there are other ways of doing it. No one would expect to make a rubble wall which would take water. May I read what I was going to say?

Q.—Please do?

A.—The wall was properly designed.

Q.—Is that some document we have got that you are reading from?

A.—You will get a copy of this, I think. I do not think we have got copies at the moment.*

Q.—I beg your pardon.

A.—The wall was properly designed with small material—that is the run of the quarry—in the middle and the large stones outside. Properly constructed, the wall should have blinded itself in time, because the silt-laden water would have filled up the small interstices and made the wall watertight, though in the case of water with silt in suspension in the way that it was, as I shall point out later, much more drastic measures might have to be taken. Naturally, above the filling tidal water will flow through the wall. The wall was not built according to the plan and specifications. It really lay with the engineers in charge of construction. They had a specification and they had a plan, and I was not the executive and I was not always on the works. Here is the cross section of the wall, and here is the specification (documents produced).

Q.—Will you hand in that plan and specification?

A.—Yes. (Same handed in.)

Q.—We will mark them, and then they will be returned. If the wall was not being built to specification, as you were out there each year for two months or so, why did you not intervene?

A.—If I went out after they had done six months' work, I could not see with my own eyes exactly the size of the stone they put into the interior of the wall. We were always instructing them to put the run of the quarry in the middle of the wall; and that will be supported by Mr. Halcrow, who will give evidence on that.

Q.—Supposing you were there on the 20th November, 1922, on the 20th November, 1922, they were building the wall?

A.—Yes.

Q.—You could have gone down and seen the stuff being brought from the quarry, seen it being tipped, and seen the whole operation?

A.—I did. I constantly did see it.

Q.—Did you ever complain to Sir Lawless Hepper or to Mr. Lewis that they were not building the wall according to the specification?

A.—Yes.

Q.—You took exception to the size of the stones on one occasion, did you not?

A.—Yes.

Q.—Is there any document you know of in which it has been stated that they were departing from the specification?

A.—There is a document in which we said that we wanted the run of the quarry. We did not want them to divide it up, but we wanted the run of the quarry in the middle. I think that was with reference to Mr. Halcrow's inspection.

Q.—Is there anything further on that point that you would like to say?

A.—Yes. When the dredging started, I have already described to you how pleased we were with the first year's dredging, and we were getting material—I dare not use the words " hard " or " soft."

Q.—But we must have the word that you used—you said hard material?

A.—I thought we would not go into that again.

Q.—That is the word.

A.—Whatever it was, the material was particularly good, and so far as I could see —I remember this occasion—very little was being lost through the wall. On the occasion when I was asked if certain blinding could be done, in that letter you refer to, I remember pointing out that I would rather have the material elsewhere. I cannot remember all the details, but I do remember distinctly on several occasions—I do not think it is in writing—that I pointed out to Mr. Billington and Mr. Lewis, and I think to Mr. Brims—but of that I cannot be certain—that if there was material which was escaping anywhere, it was down a large storm water drain, and that this should be closed. When at a later date it was apparent to the engineers on the spot, who were looking at the work all day, that there were actually large quantities of the material escaping through the wall, surely it was their obvious duty to take action. I understand that Mr. Brims, the Superintendent of Dredging, asked repeatedly that this should be done, but he was refused sanction by Mr. Elgee, the Chief Engineer; and we will bring evidence on that point when Mr. Settle gives his evidence, because Mr. Settle reports that when he went to Bombay in 1924, the very first thing he did was to call attention to the material going through the wall, and said: " Now why do not you do something? " And that he had great difficulty in getting anything done. But you will hear Mr. Settle on that point. Then to show how we thought about the material, originally we intended to divide the reclamation area by putting in a number of cross-

* See Appendix VIII.

walls. In my report, dated 10th January, 1923, I said with reference to cross-walls: "The Chief Engineer of the Reclamation Branch has allowed for eight cross-walls against our four, the amount of stone involved being equivalent to that required for the whole of the sea-wall. Until the nature of the material dredged is actually seen"—so we come to that again, that is to say, whether we are getting water with silt in suspension, or whether we are getting water with balls of clay, or what we are getting—"it is impossible to say how many walls will be required, and it may be necessary to divide the area into still smaller sections. But I hope by using moorum in conjunction with stone that a saving in the latter may be effected." In the report dated 10th January, on seeing the material, I reduced the number of cross-walls to two, and proposed to use for dividing up the area the storm-water drains. Obviously, when the Chief Engineer and Superintendent of Dredging saw what was practically the water with silt in suspension flowing through the wall, they should at once have increased the number of bunds and made settling tanks, as I had contemplated. I said that it may be necessary to divide the area into still smaller sections. You might have a big area and make a series of settling tanks, and experience will teach you what to do. But to think the engineers, because on this one occasion when, as I say, there was practically nothing going through the wall, and I saw the material—I remember distinctly telling them that I did not think at that particular date they need do anything—should for two years afterwards do nothing at all, and then hold up their hands in horror——

Q.—It is one year from January, 1924?

A.—Yes—and hold up their hands in horror and say it is impossible, and take no action—well, I have no words too strong in condemnation of, as it seems to me, such strange conduct.

Q.—Is that all you have got to say about the sea-wall?

A.—Yes.

Sir H. Courthope Munroe.—May I just correct a date? I think the witness stated that Mr. Settle went to Bombay in December, 1924.

Chairman.—Did he say that?

Sir H. Courthope Munroe.—In point of fact, I am told by Mr. Settle it is 1925; I do not want to get a mistake in the notes.

Chairman.—December, 1925.

Sir H. Courthope Munroe.—Yes. Later on we may get into a difficulty.

Chairman.—Yes; it becomes of importance.

Sir H. Courthope Munroe.—December, 1924, should be November, 1925.

Chairman.—Will you correct that, Sir George?

Sir H. Courthope Munroe.—The date you have given has been given in error; the real date is November, 1925.

A.—Yes. That is for Mr. Settle.

Chairman.—There is one passage in that statement I would like to ask you a question about. You said you came to the conclusion that a large amount of this silt was escaping through an old storm water drain?

A.—Through a storm water drain.

Q.—Was it an old one or one that was put in by the reclamation people?

A.—One that was being put in by the reclamation people.

Q.—But no storm water drains were put in before 1922, surely?

A.—Yes, there was one being put in.

Q.—Do you mean a little one?

A.—Yes; there was a culvert.

Q.—Is *this* the one you are referring to—that little one?

A.—That is the one. There was a hole in the wall, I remember.

Sir Frederick Hopkinson.—It was not done till 1923.

A.—There was certainly a hole in the wall; in 1923 the wall was built.

Chairman.—We can check this afterwards. I just want to get your evidence on it. Do you say there was a hole through the wall through which the storm water drain would pass?

A.—Yes.

Q.—Out into the open sea?

A.—Out into the open sea.

Q.—In your view a large quantity of silt was escaping through that?

A.—Through that hole in the wall.

Q.—You said that was one of the storm water drains constructed during this reclamation?

A.—Certainly. I do not know how many lineal feet of the drain had been made, but certainly I remember looking at the hole in the wall.

Q.—What date are you fixing for this? Is it January, 1925?

A.—I am fixing it at the date of——

Q.—The interview?

A.—At the date of that letter.

Q.—Letter 107?

A.—Yes.

Q.—That is January, 1924?

A.—Yes. I say that there was a hole in the wall in January, 1924, through which there was silt and storm water escaping; I have it distinctly in my memory. There is no record of it, but I remember distinctly saying, " There is water going through, but what is going through the main wall is insignificant."

Q.—By January, 1924, it is probable that there was a storm water drain passing through that sea wall. I think one can satisfy oneself about that by looking at some papers?

A.—Yes.

Mr. Billimoria.—Where was the hole? Was it in the middle, in the top, or in the bottom?

A.—It was in the bottom of the wall.

Q.—Did you take any steps to rectify that at once? A hole in the bottom could be easily filled in.

A.—I had no power to take steps. I say that I remember pointing it out to the Executive.

Chairman.—As a matter with which they should deal?

A.—Yes. I remember incidentally discussing it on the ground.

Q.—As the supervisor of the works it would be part of your duty to point that out to them?

A.—Yes.

Q.—It being pointed out to them as a real cause of the loss of the material, it was their duty to fill it up?

A.—Yes.

Q.—And later on, perhaps, it was your duty to see that they had done it?

A.—If I happened to be in Bombay.

Q.—On page 38 of your statement you say: " On the 24th November, 1919, on instructions from the Bombay Government, and accompanied by the Secretary to the Government, I proceeded to Delhi to discuss the scheme with the Government of India, and had a series of conferences with the member of the Council concerned, the Finance Member, and the Secretary to the Government of India Public Works Department." What was the name of the Secretary to the Government who went with you?

A.—I rather think it was Mead.

Q.—He is now dead?

A.—Yes.

Q.—Then you had a series of conferences with the Member of the Council concerned —who was he?

A.—Sir Claude Hill.

Q.—And the Finance Member?

A.—The Finance Member also.

Q.—Who was the Finance Member?

A.—The Finance Member was the officer who is now Governor of the Punjab.

Q.—Sir Malcolm Hayley?

A.—Yes.

Q.—And who was the Secretary to the Government of India Public Works Department?

A.—That was Sir Sydney Crookshank.

Q.—Those are four officials?

A.—Yes.

Q.—Had any one of them any personal experience of suction dredging, do you imagine?

A.—I cannot speak for Sir Sydney Crookshank, but I cannot believe that Sir Claude Hill or Sir Malcolm Hayley had any experience of suction dredging.

Q.—Or Mr. Mead?
A.—Or Mr. Mead.

Q.—Or any idea of how to set about building a sea wall?
A.—No, I do not suppose that they did. Sir Sydney Crookshank ought to have.

Q.—Have you read his evidence?
A.—Well, I really have not had time.

Q.—You may take it that he disclaims any knowledge of anything about suction dredging, and would not be offended if one put his knowledge of these matters as most superficial. If you expressed to those four gentlemen any opinion about the output of dredgers, weight of anchors, forces of tide, percentage of solid material passing through the pipe, or any of those technical matters, of course, none of them would have dared to say anything in contravention of it, would they?

A.—I would not say that of the Chief Engineer. The Secretary of the Government of India Public Works Department is supposed to know everything about engineering—every branch of it.

Q.—Is he supposed to know about marine engineering?

A.—He is supposed to be able to have access to people who do know, in the marine engineering branch. I put it in this way to you : I do not know whether they do it now under the Government of India Act, but certainly not so many years ago all marine works went up to the Secretary of the Government of India Public Works Department. They were frequently very severely criticised, and they assumed a complete knowledge of the subject.

Q.—Lord Lloyd has expressed the opinion (I am going to put it to you as a very fair way of meeting it) that they would be very largely in your hands. I am not suggesting anything improper at all, but you were the expert. You were the man known to them as having done work in Rangoon and in Mesopotamia, and had obtained a Knighthood and the K.C.I.E., and have been all your life an engineer. Would not that put them very greatly in your hand?

A.—It would depend upon the temperament of the men; it depends very largely on the temperament of the men. When I was carrying out the river training works in Rangoon, there was an officer at the head of the Public Works Department who was very different in temperament—I say it without any disparagement to Sir Sydney Crookshank—and he and I disputed for four or five years before the river training works were begun; so that I say it is a matter of temperament. Some Secretaries might say : " Well, I do not know about this," and others might argue the point. I do not think it could be laid down as a rule.

Q.—Sir Sydney Crookshank did induce you to increase the dredging cost from 6 annas to 8 annas, did he not? Do you remember that?
A.—I do not remember that.

Q.—Was your figure always 8 annas?
A.—I think my figure was always 8. I remember that as my completed estimate was increased from 367 lakhs to 400 lakhs.

Q.—Did Sir Sydney Crookshank at the interview you had with him at Delhi go into the matter as a man understanding it, as a man of any degree of quality, with you?
A.—He has his technical staff. I cannot say that he devoted very much time to personally discussing the matter with me. An officer in that position has his technical staff. I did not know what inquiries they made or what action they took. It was open to Sir Sydney Crookshank to take any action he liked to ascertain whether my plans and estimates were accurate or not—in fact, I go further and say, that it was his duty to do so.

Q.—Did he make any criticisms whatever upon the text of your report?
A.—I do not know; I do not remember that he made any.

Q.—Or on the feasibility of the scheme?
A.—No, I do not think he made any criticisms to me.

Q.—Or the fact that the work could be done at 367·61 lakhs?
A.—No, I do not remember that he made any such criticism.

Q.—Can you suggest any criticism that Sir Sydney Crookshank made of your scheme, or any useful contribution that he made?

A.—I have never seen Sir Sydney's report on the subject. I am hardly in a position to answer that question. I have seen no report.

Q.—We have not seen it.

A.—I have seen no report, so that I really do not know what he said or at what length he commented on anything.

Q.—When you were discussing it did he make any useful comment that you remember—any comment showing that he was bringing a skilful and trained engineering mind to it? That is what I want to know.

A.—I cannot remember that he made any very useful comment.

Mr. Billimoria.—You say in this paragraph that you left Bombay on the 24th November, and returned to Delhi on the 29th November. If you left on the 24th you would not have reached Delhi until about the night of the 25th; that would be the earliest at which you could reach Delhi?

A.—Yes.

Q.—So that you would not have any interview with Sir Sydney Crookshank before the 26th?

A.—If I left on the 24th November?

Q.—I am reading your paragraph 47.

A.—Yes.

Q.—So that you would not have discussed the proposition with Sir Sydney Crookshank before the morning of the 26th?

A.—Excuse me one moment; I should have to think of the train I left on the 24th by, and the time I got to Delhi. I think we started the discussions as soon as we arrived. I remember having discussions in the evening with Sir Claude Hill. I really cannot answer that question without looking at the time tables and finding out what time I arrived.

Q.—I can tell you no train arrives in Delhi before 8 o'clock in the evening, so that it would not have been possible for you to have discussed the proposition except at the dinner table, if you were dining with Sir Claude that night?

A.—This is the 25th?

Q.—Yes, the 25th.

A.—Very well, then, we had the 26th and 27th and 28th. I rather think the train leaves on the 29th at midnight from Delhi to Bombay.

Q.—Do you think that a discussion of four days with the Secretary of the Public Works Department would enable him to go through your estimates thoroughly and to express any opinion thereon?

A.—It was not for me to say how long I was to be in Delhi, but as soon as the officials in Delhi told me that they had received all the information they required, I left Delhi. If they had wanted me to have stayed a long time in Delhi I would have stayed a long time in Delhi.

Chairman.—The theory probably would be that they had papers laid before them, and then when they were ready they would send for Sir George.

Mr. Billimoria.—That could not be, because Sir George in his evidence has said he brought the report out to Bombay although it is dated September. He brought it out from England, but it was not sent over.

Chairman.—We must be a little careful about this. The report was in existence in September and it was laid before the Government of Bombay in October. If it was sent to the Government of India it could easily reach them in the month of October. It is on the 24th November, three weeks later, that Sir George has his interview, so that there was plenty of time for the Government of India to instruct itself before sending for Sir George.

A.—I should like to make it plain that it was no business of mine to dictate to the Government of India how long they would consider my report. As soon as they said they did not want me any longer I naturally left Delhi and returned to Bombay. I did not go of my own free will.

Q.—At all events, did you give to the Government of India as much time as they wanted you to give for the discussion of this matter?

A.—I gave them all the time they wanted for discussion. I had no desire to hurry anything.

Q.—All I am suggesting to you is that three of these people had no expert knowledge, and one had not sufficient expert knowledge of these highly technical matters to be on any real equality with you in the discussions. At page 39 you say : " Sir George Lloyd said definitely and repeatedly that he did not wish the work to be carried out by the Bombay Public Works Department. On the 3rd December, 1919, I submitted a note giving my views as to the execution of the work on the supposition that my firm would be the engineers." Can you tell us if you have it in your recollection, what was the point that Lord Lloyd made with regard to the non-employment of the Public Works Department?

A.—As far as I can remember, Lord Lloyd's idea was to have the work done free from, what shall I call it? the incubus of Government control—free from the intolerable

delays caused by having to ask sanctions every day, and meeting audit objections; then there was the lack of costing, and generally the procedure which is inevitable in carrying out work under the Public Works Department. Sir George Lloyd discussed it with me several times, and his idea was to be free from these restrictions.

Q.—To create a body that would be more elastic and quicker in procedure?
A.—Yes.

Q.—At that time there was no idea of the Development Directorate. That came subsequently. At that date I think it must have been in Lord Lloyd's mind to create a body of that character, because we have had it in evidence that in January, 1920, he was discussing it with Sir Lawless Hepper. Of course he may not have mentioned it to you?
A.—He did not mention it to me. My recollection of the way in which he discussed the Back Bay scheme was that, at all events at that date, he had not contemplated the Back Bay scheme being merged in the Development Directorate. He may have had the Development Directorate in his mind, but he had not contemplated merging the Back Bay scheme into it.

Q.—In your view, was it an advantage to the Back Bay scheme to include it in a large number of other schemes for the development of Greater Bombay?
A.—No; I was always rather sceptical about it, and I never thought it was desirable for the Development Directorate to carry out the Back Bay scheme.

Q.—The other matters which were in the hands of the Development Directorate from the reports appear to have been immense—the development of Salsette and the building of chawls?
A.—Yes.

Q.—This was only one of many?
A.—It was one of several schemes.

Q.—Returning to page 39, you say: " On the 3rd December, 1919, I submitted a note giving my views as to the execution of the work on the supposition that my firm would be the engineers " : " At the time this memorandum was prepared the Bombay Development Directorate had not been created, and I understood my firm would be in sole charge and control, and that our resident engineers would be free from the numerous restrictions on the economical execution of work which obtains in India on works carried out by the Government." At that time what did you gather would be the extent of your responsibility if you were in sole charge and control? Would you, in that event, be practically in the position of a contractor?
A.—No; I do not think we should ever have been in the position of a contractor.

Q.—Practically?
A.—Not a contractor.

Q.—If you were in sole charge and control with your resident engineers, and so on, would not that be so?
A.—If the work is being done departmentally it does not necessarily mean that the engineers are contractors.

Q.—You mean you would have been in a commanding position—that you would have been able to discharge members of the staff, and done things of that character?
A.—Certainly we would have had control of the staff, and we would have known what the work was costing. In fact, we would have been in a very different position from that which obtained under the Development Directorate.

Q.—You then refer to the interview of the 24th December, 1919, at which you discussed the purchase of the dredger, and it was decided to despatch a cablegram to your London office asking for tenders for the construction of a dredger to be obtained from various dredger-builders?
A.—Yes.

Q.—Then on the 14th January, 1920, you, being in Burma, got a telegram saying that the Bombay Government had decided to appoint your firm the consulting engineers of the Back Bay scheme?
A.—Yes.

Q.—I think you got back to Bombay on the 18th February?
A.—Yes.

Q.—And on the 21st February you had an interview with Sir George Lloyd?
A.—Yes.

Q.—And discussed with him how the work could best be pushed forward, as he was very anxious to see a start made?
A.—Yes. May I hand you in an accurate list of the dates for all the years of when I arrived at and left Bombay?

Q.—That would be very useful for us to have. (*Document handed in.*) At the very first interview, when you saw Lord Lloyd in connection with this matter, did he impress upon you that the matter was an urgent one?

A.—He did, undoubtedly.

Q.—Again, on the 21st February, 1920, was he anxious that the work should be proceeded with as quickly as possible?

A.—He was always anxious that the work should be proceeded with as quickly as possible; but not having technical knowledge, he did not realise the extent of the preliminary work which one had to do.

Q.—Before you could show some results?

A.—Yes.

Q.—Equally in May, 1919, was he anxious to have your report at the earliest possible moment? When you were first asked to prepare a report on Mr. Kidd's scheme, was he anxious to have your report at the earliest possible moment?

A.—Well, he wanted to start the work before the next monsoon. I do not say that he specifically said: "Rush through this report and let me have it as soon as possible." He certainly did not do that; but he indicated that once the work was sanctioned he did not want to lose another monsoon.

Q.—That is right. So that that really meant that the report ought to be out at the end of the monsoon, if it could be done?

A.—Yes.

Q.—It was desirable?

A.—It was desirable.

Q.—I think it was on the 22nd February, 1920, that you learned that the Council had approved of your appointment?

A.—Yes.

Q.—Then it was Sir George Lloyd told you of his scheme for a Bombay Development Department?

A.—Yes.

Q.—Did you arrive in London on the 17th March, bringing with you a letter of introduction from Lord Lloyd to Mr. Montagu?

A.—Yes.

Q.—Who was then the Secretary of State for India?

A.—Yes.

Q.—Did you write a letter to the Private Secretary to Mr. Montagu, in which you say this: "I have had the advantage of discussing the subject fully with the Governor in Council, Bombay, the Government of India, and personally with Sir George Lloyd, and if the scheme is sanctioned by the Secretary of State His Excellency wishes no time to be lost in placing the order for the dredger, as it is necessary for everything to be ready to begin the reclamation as soon as the first section of the wall is finished"?

A.—That is correct.

Q.—The plan in your mind, if I may go to the map for a moment, was this. You were to begin the wall from the Military, Colaba, end?

A.—My very first idea was to begin it at Colaba.

Q.—And the scheme was to carry the sea-wall along to a certain point, and then shut in a lagoon by building a cross-bund?

A.—Yes.

Q.—So that you had an enclosed area composed of a section of the sea-wall, and at right-angles to it a cross-bund joining up with the land?

A.—I think before we got to that stage we had decided that, owing to transport difficulties, it would be preferable to begin the work at Marine Lines.

Q.—Anyhow, was the same plan to be followed? If you went to Marine Lines you would build this section of the sea-wall?

A.—Yes.

Q.—And then build a cross-bund?

A.—Yes.

Q.—Enclosing completely that little area?

A.—That is right.

Q.—As a matter of economy, you would naturally carry your sea-wall to an extent just beyond the point necessary for your cross-bund?

A.—That was the idea.

Q.—Otherwise you are putting too much money into your sea-wall?

A.—Yes.

Q.—You would go on with the reclamation in this block; and you would then at the same time be producing your sea-wall; and again, when you had reached a sufficient length, you would enclose the area by a cross-bund?

A.—That is correct.

Q.—But, again, having only just sufficient sea-wall to keep ahead of your reclamation?

A.—That was the programme of works; but, as I say, the very first idea was to start at Colaba, but transport difficulties were so great that before we had really got any plans out for Colaba we had decided that it would be much cheaper to begin from Marine Lines and proceed as you have described it.

Q.—In this letter of the 17th March you are intimating that the reclamation should begin as soon as the first section of the wall is finished?

A.—Yes.

Q.—By that you mean what I call the lagoon, the enclosed lagoon at Marine Lines end?

A.—Yes; I think it was at Marine Lines end.

Q.—Or either end?

A.—Or either end. That was the idea. The idea was that the work would be started on the wall at the end of that monsoon, so that considerable progress would have been made with the wall the following year.

Q.—You hoped, and indeed it was part of your plan, that the dredger would arrive at a time when one area, be it Colaba or Marine Lines, would be ready to receive the pumped material?

A.—Yes.

Q.—The two were to synchronise?

A.—The two were to synchronise.

Q.—They failed to do so, did they not, very badly?

A.—They failed very badly.

Q.—Why was that?

A.—Well, I think I can explain that in a few words.

Q.—I wish you would?

A.—I have pointed out to you that in the first instance it was proposed to begin at Colaba, but then we changed our plans owing to the expense of transport, and the proposal was then to begin at Marine Lines, and arrangements were being made to begin at Marine Lines. It was intended by the Bombay Government that the wall construction should be put in hand in October, 1920, and a contract was actually let in Bombay by the Bombay Government. I was not present and do not know the details, but a contract was let by the Bombay Government. It was subsequently cancelled and a resolution of Government passed that the work should be done departmentally. The work was not, therefore, begun till October, 1921, so that a whole year was lost in beginning the work because, instead of the work being begun in October, 1920, according to the original desires and wishes of the Governor, they decided not to accept that tender, and the work was postponed. Then in July and August there was correspondence between the India Office and myself on the subject of whether it would be possible to begin at both ends simultaneously. I think you have that.

Q.—I will deal with that as a separate matter, unless you would like to do it now. Let us see if we can shorten that. Is the substance of that that you received an enquiry from the Secretary of State here?

A.—Yes.

Q.—Asking whether it was practicable to begin the sea wall at both ends?

A.—Yes.

Q.—To that you replied that it was practicable, but that it would mean an increase of cost?

A.—Yes.

Q.—Am I right in thinking that on those documents, while you were saying it was practicable you were not enthusiastic about it, as it meant a complete change of plans? It meant an increased cost and an increase of plant?

A.—I do not know that I was exactly not enthusiastic about it, but as you know, the reason was given that they really wanted the land more urgently at Colaba than they wanted it at Marine Lines. That was emphasised later on by Sir Lawless Hepper.

Q.—We might take these telegrams and I will just read them, as they are short. There is a telegram from the Governor of Bombay dated the 4th July, 1920.

A.—Yes.

Q.—"Following for Buchanan. Telegram begins: Back Bay. His Excellency would be glad of your telegraphic opinion as to feasibility of beginning work at both

ends at the same time. Military authorities concerned in getting reclaimed land adjacent to Colaba, are anxious that Colaba end should be reclaimed as early as possible. On the other hand, his Excellency believes you considered necessary to start Western end first on account of railway communications." That is his telegram?

A.—I did not get that telegram, but I got it in the form of a letter.

Q.—The letter is the 7th July. The letter, though not setting the telegram out textually, gave you the exact substance of it?

A.—Yes.

Q.—Then in reply to that letter your firm suggested the following reply for transmission by cable to the Government of Bombay: " Buchanan reports that it is practicable to begin work on the Back Bay scheme at both ends simultaneously. In constructing the wall the bulk of the work would be carried out from the Western end, the stone being conveyed to the site by rail from quarries near Andheri, but a considerable length of wall could be built from the Eastern end, as the wall would be of concrete throughout, and sufficient stone could be procured locally. To begin building the wall in two places will not materially advance matters unless reclamation can also be proceeded with, and Buchanan is considering whether the new dredger and the ' Jinga ' "—was that a misprint for " Kalu "?

A.—Yes.

Q.—" —whether the new dredger and the ' Kalu ' can work simultaneously at Eastern and Western areas. Buchanan understands Lewis is on his way home, and he will discuss all these points fully with him. Message ends." Then on the 15th July your firm sent a letter to Whitehall saying: " With reference to your letter of the 7th July and our reply dated 10th July, we beg to suggest the following additional message for transmission by cable to the Government of Bombay." Then: " Buchanan has now satisfied himself that the dredger ' Jinga ' "—again that must be the " Kalu "?

Q.—" and the new dredger "—that is the " Sir George Lloyd "?

A.—Yes.

Q.—" Can work together on Bombay reclamation, and therefore work on construction of the wall can proceed from both ends simultaneously. Buchanan asks for very early orders as to whether he is to proceed on these lines, as considerable changes in designs for execution of work will be necessary." On the 29th July the Governor of Bombay telegraphs to the Secretary of State: " Work may start from both ends." That was communicated to you, and that is your warrant for saying in your report of 1922 on page 2: " Under the orders of the Government the construction of the new wall is being proceeded with from both ends simultaneously "?

A.—Yes.

Q.—That was an order of the Government?

A.—Yes.

(Adjourned for a short time.)

Chairman.—Before the adjournment we were on the question of the sea wall?

A.—Yes.

Q.—It amounted, did it not, to a proposal to do two independent dredging operations?

A.—Yes.

Q.—It would have involved four crews?

A.—Yes.

Q.—Two dredgers and two boosters?

A.—Two dredgers, yes.

Q.—And two boosters?

A.—I would not like to say about the two boosters at the present moment.

Q.—It was ultimately proposed to buy the " Jinga," was it not?

A.—I think the " Jinga " had been purchased then.

Q.—That is right; she was purchased?

A.—Yes.

Q.—She was supposed to work eventually in conjunction with the " Kalu "?

A.—The " Kalu " was purchased, yes.

Q.—The " Kalu " was purchased, and so also was the " Jinga "?

A.—The " Jinga " has been purchased since.

Q.—Yes. The " Jinga " was bought in order to work in conjunction with the " Kalu "?

A.—Yes, that is right.

Q.—She has never done any work yet?
A.—No, I do not think she has done any work yet.

Q.—She was bought for £10,000?
A.—Yes.

Q.—Have you any idea how many thousand pounds the repairs will be when eventually they are done?
A.—No, I have not.

Q.—She is still in dry dock being repaired, is she not?
A.—I have no information on the subject.

Q.—We thought she was a phantom ship for a long time, but eventually we found her in dry dock in India?
A.—I have never been consulted about the cost of repairs. I am in ignorance of the cost of anything.

Q.—In addition to all the plant there were two sets of floating pipe line?
A.—Yes.

Q.—One of the immediate results of deciding to build the sea wall from both ends was that you had to bring down 2,000 tons of spoil from the quarry each day instead of 1,000 tons, had you not?
A.—Yes, we had to bring down more, certainly.

Q.—2,000 tons?
A.—Yes.

Q.—Did that involve a purchase of some 130 wagons?
A.—Yes.

Q.—At a cost of about £375 each?
A.—Yes.

Q.—Half a million of money?
A.—Half a million of money. I am not going to say that if it was necessary to build the sea wall from both ends at once it was necessary to have double the plant and 2,000 tons of stone a day.

Q.—If the sea wall had to be carried on according to programme from the Marine Lines and it was supposed to involve, and it would involve 1,000 tons of stone a day, would it not?
A.—I would not bind myself to that.

Q.—Was not that the estimated figure to which they were working?
A.—They were working to that.

Q.—They were working to 1,000 tons a day. When you decided to have it built from both ends it had to be twice 1,000 tons, which is 2,000 tons?
A.—Yes, 2,000 tons.

Q.—It was rather an expensive decision, was it not?
A.—It was rather an expensive decision, but the atmosphere then was that money was no object.

Q.—You mean that the belief was that the land reclaimed, with which you had, of course, nothing to do, would be sold at such a great profit?
A.—At such an enormous profit.

Q.—It would be sold at such an enormous profit that two million pounds or three million pounds thrown away made no difference one way or the other; is that your point?
A.—Exactly, that the one million pounds would be spread over so many square yards of land. If you put one million pounds into so many million square yards of land in consequence of the enormous profits that were going to be made it really did not matter.

Q.—Buying a dredger at £75,000, spending £25,000 on her for repairs, and keeping her idle for five years, with the consequent loss of interest of £20,000 or £30,000, was really a matter of no importance?
A.—Not in the estimates of the revenue in those days.

Q.—So be it. Anyhow, do you suggest that building the sea wall from both ends was a business proposition?
A.—I wanted to do it from the top end.

Q.—I know that you did. The telegrams are quite clear, and nobody is suggesting that it was done on your initiative?
A.—No, it was not a business proposition.

Q.—That is what I wanted to know. It was not a business proposition?
A.—In that connection, to show how urgent the development at Colaba was considered, the Director of Development in a note addressed to the Chief Engineer, dated May, 1922, made the following remarks: " So far our energies have been directed

mainly to the Marine Lines end of the work, and at the commencement in the absence of information as to the proposed lay-out there was no particular reason for any special preference being given as between Marine Lines and Colaba. Mr. Davidge's preliminary lay-out plan has, however, now been accepted in the main, and it is evident, looking at the reclamation as a commercial proposition, that this portion of the reclamation from Colaba northwards as far as Mayo Road is of the first importance, a view which receives further support from the agreement we have come to to sell 265 acres at the southern extremity of the reclamation to the Military Department. It is in fact now apparent that in order to begin to realise money by sales to the Military and public as soon as possible we must concentrate on Colaba and reclaim from the South by sections, the sections being conveniently formed by bunds following the main roads running at right angles to the sea wall."

Q.—Apart from the agreement with the Military, there was another reason why Colaba should have been reclaimed first, was there not? The fact that the land at the Colaba end is far more valuable than the Marine Lines?

A.—Yes.

Q.—Therefore, as it was part of the scheme to get a return on the money as soon as they could, obviously it was better to begin at the Colaba end, and carry the reclamation along the part which would sell at a higher rate than the Marine Lines?

A.—Yes. From the engineering point of view it was very much cheaper to begin at the Marine Lines end, because to take one point, the railway from Marine Lines to Colaba cost, I think, 7 lakhs of rupees.

Q.—Your view was to have the " Kalu " pumping into what is marked on the map as Block No. 1; is that right? The " Kalu " was to pump at the Marine Lines?

A.—No. My view was that the " Sir George Lloyd " would pump into the Marine Lines, and the " Kalu," working close to the shore with a convenient pipe line, would pump into the small piece at the Colaba end.

Q.—Could the " Sir George Lloyd " ever pump into Block No. 1 at the Marine Lines end?

A.—That was always an open point, and we had it always under consideration, whether we should not have to put a land booster for the last piece.

Q.—I am very puzzled by an answer of that kind. In 1919 Bombay was just as it is there on the map?

A.—Yes.

Q.—There had been no increase of land anywhere?

A.—No.

Q.—If you now know in 1926 that you cannot do it, why did not you know that you could not do it in November, 1919; there has been no physical difference of any kind?

A.—I do not quite follow you.

Q.—You say it has always been an open point. You mean owing to the length of pipe line, do you not?

A.—Yes.

Q.—The length of pipe line to-day is the same as the length of pipe line was in 1919?

A.—Yes.

Q.—There is no difference. Why did not you ascertain that in 1919?

A.—We did not want to go to the expense of ordering a land station at that time. It is really a question of cost. You can pump through a very much longer pipe line than the maximum given, say 5,000 yards, or 10,000 yards. You can pump through a very much longer pipe line, but you do not get it at the full bore.

Q.—You get a reduced output?

A.—Yes. It was a matter for consideration whether for that small piece up at the top end you would do it with the longer pipe line—there was not much in that piece—or whether you would have an additional land booster.

Q.—There is also Block 2. Have you worked out the distances?

A.—We worked out all distances.

Q.—You have?

A.—Yes.

Q.—Then you are able to tell me, are you not, that to pump from the Harbour across that bit of the Peninsula into Blocks 1 and 2 could not possibly have been done with the plant estimated for in your Report?

A.—We did not think so at that time.

Q.—It is not a question of thinking. It is a question of arithmetic, is it not? The answer is that it cannot be done, is it not?

A.—I have a plan which I can produce.

Q.—Will you, on Monday, endeavour to show us how, with the plant available as mentioned in your Report, you could pump into Block No. 1 and Block No. 2?

A.—Yes, I will do that.*

Sir Harry Courthope-Munroe.—I did not quite follow, Sir, what was your inquiry. I want to see that Sir George Buchanan thoroughly understands it?

Witness.—You want me to produce on Monday a plan showing how, in 1919, we proposed to deal with the Marine Lines?

Chairman.—No, not a plan at all. I do not want a plan necessarily. Here is one of these little measuring instruments and you can do it on the map. You can measure it off on the map, and show us how it could be done.

A.—We worked it all out with models. I think we have got a plan.

Q.—If you have not got a plan, will you take it off the map, and show us how it can be done?

A.—Yes.

Q.—You will remember that you have got 10,000 feet of pipe line only to deal with in regard to this question?

A.—Yes.

Q.—The suggestion about building the wall at both ends came from non-technical people, the Governor of Bombay and his advisers?

A.—Yes.

Q.—Was not it your duty, as their technical adviser, to tell them that it was an expensive scheme; that it was not, as you have told me to-day, a business proposition?

A.—No, I do not think so. They gave their reasons why they wanted it started at both ends.

Q.—They have given the reasons, but you told me five minutes ago that it was not a business proposition, and I have given you a few figures about it?

A.—Yes.

Q.—The figures include £500,000 spent on extra rolling stock. Do not you think that you ought to have telegraphed back to the Governor of Bombay and said: "This will cost £500,000 in rolling stock alone. It will mean the employment of two dredgers, two boosters, and additional pipe line, and it will be a most costly undertaking"?

A.—I was asked if it were practicable, and I replied that is was practicable.

Q.—Practicable, of course, meant not merely possible from an engineering point of view, but practicable from a business point of view, did it not?

A.—There was no question of cost in those days.

Q.—You come back to the point that money was no object?

A.—I come back to the point that in those days money was no object.

Q.—It is being looked at very carefully to-day, is it not?

A.—Yes.

Mr. Billimoria.—Whose funds were these?

A.—Whose funds?

Q.—These were public funds, ratepayers' moneys. There was no consideration paid to ratepayers' money; is that what you suggest?

A.—I am not in a position to deal with the higher points of finance.

Chairman.—I think you put it in this way, that at that moment the authorities were of opinion that this would yield so much profit any way that a million or two really did not matter; that is it, is it not?

A.—Yes, that is it.

Mr. Billimoria.—If it was a business corporation would it have mattered to them? If it was not the Government, but a public corporation, or a private individual, would it not have affected their purse?

A.—I do not know. I think that even a public corporation, if they had such sanguine ideas as to the profits they were going to make might have said: "Carry on."

Chairman.—Continuing with page 42 of your statement, I am still reading the letter that you wrote to Mr. Montagu's private secretary. You say: "In this connection, a tender for the dredging plant, in accordance with the general specifications drawn up by my firm, was received from Messrs. Wm. Simons & Co., Ltd., and, acting on Sir George Lloyd's personal instructions, my firm took in tenders from other builders, the result of which was communicated to the Governor in Council, when I recommended Messrs. Simons' tender be accepted, subject to my firm's approval of the detailed plans and specifications, and to certain important modifications which appeared necessary to me after further consideration on the spot of the best means of carrying out the works?

A.—Yes.

---

* See Appendix IX.

Q.—When you recommended the Government to accept Messrs. Simons' tender you had not seen the elaborate tender of Messrs. Lobnitz, had you?

A.—I could not tell you whether I had seen it.

Q.—Let me recall the dates to you. All that you had seen then was the telegram which your firm sent to you saying that Messrs. Lobnitz were offering two dredgers, and such and such material at such and such a price?

A.—Yes.

Q.—But you had not seen Messrs. Lobnitz's detailed specification of what they offered?

A.—No, I had not seen Messrs. Lobnitz's detailed specification.

Q.—Of course, you have the original of Messrs. Lobnitz's specification?

A.—I have that, yes.

Q.—You might look at it before Monday, because we have also a copy of it, and we should like to ask you some questions about it.

A.—Yes.

Q.—Your letter says: "—— and to certain important modifications which appeared necessary to me after further consideration on the spot of the best means of carrying out the works." What were the important modifications in the specification?

A.—Really, at this date I cannot recall them to memory.

Q.—I have looked rather carefully at the specification. Do you see any modifications after the 12th September? I cannot find any modifications.

Sir Frederick Hopkinson.—The only modifications have been modifications by which the work has been cheapened.

Chairman.—Yes You say: "—— and to certain important modifications which appeared necessary to me after further consideration on the spot of the best means of carrying out the works." "On the spot" meant after further consideration at Bombay, did it not?

A.—Presumably.

Q.—The contract was given to Messrs. Simons in May, 1920?

A.—In May, 1920, yes.

Q.—You left Bombay at some date early in 1920, did you not? You handed in a list of the dates when you were at Bombay? *

Sir Harry Courthope-Munroe.—The earliest date mentioned there is the 15th of November, at the top of the page.

Chairman.—It is a pity that we have not got the 1919 dates, but we can put them in?

A.—I can get them.

Q.—What I suggest to you really is that you recommended Messrs. Simons' tender to be accepted some time in 1920, or very early in 1921?

A.—Yes.

Q.—That must be so, I think. You cannot tell us what were the important modifications which you made in the specification?

A.—No, I cannot at this date recall them.

Q.—So be it. In paragraph 55 of your statement you say: "I received a letter from Mr. Brown, the private secretary to the Secretary of State, on the 23rd of March, 1920, saying that the Secretary of State was at present away from the office on account of ill-health, but that Sir John Steevens, Acting Director-General of Stores at the India Office, would be pleased to see me and discuss the Back Bay Reclamation Scheme; that he had been anxious to have an opportunity of going through the matter with me on my arrival from India, and would be glad to make an appointment with me if I would suggest a time. Accordingly I met Sir John Steevens on the 25th March, 1920?"

A.—Yes.

Q.—Then you say that on the same day you wrote to Sir George Lloyd?

A.—Yes.

Q.—At page 44 of your Statement you say: "In the first place I may say that the India Office asked Messrs. Simons & Co. to extend the time of their tender for the dredger, and they agreed to do so provided there is another material increase in their prices, and I was not far out when I told you that if the order was not placed before the 12th March it would cost your Government another £100,000."

A.—Yes.

Q.—Was that the 12th March, 1920?

A.—The 12th March, 1920, it must be.

* See Appendix X.

Q.—" After discussing the dredger proposition generally Sir John Steevens informed me that the India Office had passed orders to the effect that no order for the dredger was to be placed until the whole scheme had been sanctioned, but that he, along with his experts, was to go into the question of the dredger and decide if Messrs. Simons & Co.'s offer was desirable both from the practical and financial points of view." Was the tender of Messrs. Lobnitz ever submitted to Sir John Steevens?

A.—Not to my knowledge.

Q.—Or to Sir John Biles?

A.—Not to my knowledge.

Q.—You know as a fact that it was not?

A.—I do know that it was not; it was not submitted by my office, at all events.

Q.—" I also explained to Sir John Steevens that as we have been appointed the Engineers to the Back Bay scheme we wished to get on with the working drawings of the wall and generally proceed with the arrangements for carrying out the work as soon as possible; he made a note of this and promised to let me know when anything was settled." This is to Lord Lloyd?

A.—Yes.

Q.—" Meanwhile, time is passing and I am afraid you will be very disappointed at the continued delay in getting the Secretary of State's sanction to the entire scheme, and at this rate it will be almost impossible to have the dredger ready for work by the end of the 1921 Monsoon."

A.—Yes.

Q.—That meant October, 1921?

A.—October, 1921.

Q.—It was a real blessing that she was not ready; was it not?

A.—As it happens it was a blessing.

Q.—It was a real blessing?

A.—But you must remember that Lord Lloyd had been pressing to begin the work in October, 1920.

Q.—Yes, you have explained that. The dredger arrived in March, 1922?

A.—Yes.

Q.—" The Colaba," the booster, arrived a little later in April?

A.—Yes.

Q.—The pipe line was delivered round about the same time?

A.—Yes.

Q.—The total was about £650,000?

A.—Something like that, yes.

Q.—The " Sir George Lloyd " remained idle, so did the " Colaba " and so did the pipe line for 21 months, did they not?

A.—For 21 months I think, yes.

Q.—There not being for 21 months any single one of those little lagoons ready to receive reclaimed material?

A.—That is so.

Q.—Did that circumstances alone involve a loss taken at 6 per cent: of some £68,000?

A.—I suppose it did, yes.

Q.—And also depreciation as well?

A.—Yes.

Q.—The " Colaba," the " Sir George Lloyd," and especially the pipe lines, had to go through two monsoons doing nothing?

A.—Yes.

Q.—Does the absence of a lagoon for the dredger to do her work in appear to you to to be a lack of co-ordination?

A.—The absence of the lagoon to do the work?

Q.—Does the absence of any lagoon for the dredger to pump material into for 21 months seem to you to be a lack of co-ordination?

A.—It seems to me a lack of organisation and co-ordination, yes.

Q.—So be it. Do you attribute it mainly to the fact that the building of the sea wall was postponed until October 1921.

A.—I attribute it partly to that, and I attribute it to the delay in proceeding expeditiously with the wall at Colaba. In our judgment the dredging should have started in December 1922. In our judgment there was no reason why the dredging should not have started in December 1922 or January 1923. If the work had been pushed with more energy the dredging would have begun in December 1922.

Q.—Did not you at one time expect the first section of the wall to be ready by October 1921?

A.—That was an old arrangement which was cancelled by the Governor in Council. That was on the supposition that a contract was going to be let to a construction company in Bombay to begin the work. The whole year was lost by the work not being begun as Lord Lloyd wished in October 1920.

Q.—That still would not have accounted for it, would it, because no pumping began until the 8th December 1923?

A.—Yes, but in our judgment there was no reason at all why the pumping should not have begun in 1922.

Q.—For six months at all events, prior to October 1922, you would have been in England, I suppose?

A.—Yes.

Q.—Can you point to any letters in which you are censuring them or criticising them for not being ready to do the pumping in 1922? *

A.—Yes, I certainly can. I think I can give you one almost at once. Will you kindly turn to page 88 of my Statement. It is with reference to the Chief Engineer's breakdown in health. In paragraph 114 I say : " That Sir Lawless Hepper was aware of the way in which work was suffering is clear from the correspondence. For instance, in a letter dated 12th May, 1922, he said, ' After endless delays the railway to Colaba has been begun and I hope that under a different regime it may be possible to get it finished by October,' and on the 8th of June, 1922, I replied :—' I am very disappointed to hear from you that the railway to Colaba is just begun because so far as I am aware there was nothing to prevent it being by this time very nearly finished.' " That is just one example of the delays that occurred, and I was always urging that this railway to Colaba should be pushed on with in order that the wall should be pressed ahead at the Colaba end.

Q.—Are there any other letters?

A.—I have other letters which I will look up.

Q.—Yes. When did you consider that Mr. Lewis had become thoroughly unsatisfactory.

Sir Harry Courthope-Munroe.—That is dealt with at the bottom of page 87 of the Statement.

A.—In paragraph 104 I say : " Some time in 1921 the health of Mr. Lewis showed signs of giving way." I have dealt with that in paragraph 104.

Chairman.—Yes, you have. I will deal with that in detail later. All I want to know for the moment is, about what date did you become thoroughly dissatisfied with Mr. Lewis?

A.—It is very difficult to give an exact answer to that question because I might say that the dissatisfaction was progressive from 1921, when Mr. Lewis's health showed signs of giving way. He was laid up for three weeks in June, 1921. We got progressively anxious from that date, and on the 11th April, 1922 (page 83 of my Statement) I wrote to Sir Lawless Hepper and said : " I wonder if you are taking any action on the lines I suggested to His Excellency and to yourself."

Q.—" I wonder if you are taking any action on the lines I suggested to His Excellency and to yourself "?

A.—Yes.

Q.—Was that to get rid of Mr. Lewis?

A.—Well, it was.

Q.—Why not?

A.—Yes.

Q.—If the man could not do his work, whether from ill-health or anything else, the man ought to go?

A.—Yes, that was the suggestion that I made. It is not in writing. It was a suggestion that I made on the 11th April, 1922.†

Q.—That he should go?

A.—Yes.

Q.—That is all right. Have you seen Mr. Lewis during the last two or three weeks?

A.—I have not seen him for some years.

Q.—I was wondering if you had seen him because Mr. Lewis came and gave evidence before us, and his health must be very, very bad. Was he, even in 1919, a man of drive and energy?

A.—He was. I would like to make it quite plain that I do not want to make any reflections on Mr. Lewis's ability. I consider that Mr. Lewis is a very capable, brainy engineer, full of energy, and he was full of energy when he was engaged by us at the

* See Appendix XI. † See Appendix XXI.

beginning of the work, but he was subject to gout, and as time went on his whole physical and mental nature changed.

Q.—In 1921 you noticed a considerable change in him, did you?

A.—In 1921 I noticed a considerable change, and I never saw Sir Lawless Hepper without discussing the matter with him. Naturally I was very anxious and, as I say, on the 11th April, 1922, I said that I wondered if he was taking any action on the lines I suggested.

Q.—That is right?

A.—We said : " We feel very strongly that in the interests of the work there should be no chance of the repetition of this disastrous year of sickness."

Q.—I think on the 20th April, 1920, you had an interview with Mr. Montagu?

A.—Yes, that is correct.

Q.—And you presented a Memorandum stating the position of the Back Bay up to date?

A.—Yes. I said that Sir George Lloyd was particularly insistent——

Q.—I think this is important enough to read in its entirety. It is on page 46. You presented a Memorandum of which the following are extracts :—

" The position when I left Bombay was as follows :—

" The scheme as prepared by myself had received the approval of both the Government of Bombay and the Government of India, and the Governor (Sir George Lloyd) had discussed with me the best methods of executing the work, and had also explained his proposed organisation for carrying out not only the Back Bay Reclamation Scheme, but the whole of the housing and improvement schemes. I was informed that a despatch had been issued by the Government of India to the Secretary of State asking sanction to the entire project, and that it was tolerably certain sanction would have been received by the time I got to London.

" Sir George Lloyd was particularly insistent that the Back Bay Reclamation work must be started at the end of the monsoon, say about the month of October, 1920, and I left with the Governor a note explaining how this was to be done. I also recommended the appointment of a resident engineer, and time being an object I proposed that a contract for the first section of the wall should be given to Colonel Grisewood's Syndicate, who were in a position to make a start with the preliminaries, and begin the permanent work directly after the monsoon.

" My instructions were to proceed home with all possible speed, and, on the assumption that the Secretary of State would have sanctioned the scheme by the time I got home, I was—

" (*a*) To make arrangements for the construction of the dredger, and

(*b*) To put in hand the necessary drawings and estimates for the construction of the wall

and I was given a letter to the Private Secretary to the Secretary of State saying that his Excellency was anxious that I should be given an opportunity of discussing any details of the scheme which appeared to require explanation, with the Secretary of State."

Q.—Then I will turn to page 48. This is still the narration, is it not?

A.—Yes.

Q.—" On the 16th April I had a meeting at the India Office with Sir John Steevens and Sir John Biles, and came to a satisfactory understanding as to the relative responsibilitiy of Sir John Biles and myself. I then informed Sir John Steevens of the letter I had received stating that a firm of contractors had been given the contract for the first section of the wall, and I remarked that the most vital matter in connection with the whole scheme was to place the order for the dredger, as if this was not done promptly a whole year's time would be lost, all our plans being made on the assumption that the dredger (which would take a year to build) would arrive in Bombay in time to start operations at the end of the 1921 monsoon." By " in time to start operations " you mean to find a lagoon ready constructed?

A.—Yes.

Q.—Then you say at page 49 : " It is perhaps a pity that the Back Bay scheme is involved with so many other projects because, taken by itself, it must be exceedingly profitable to the Government."

A.—Yes, that was the current opinion.

Q.—When the matter was put before the Legislative Council on 3rd August, are you aware of there being any dissentient to the scheme?

A.—I do not know. I have no knowledge of that.

Q.—We have the debates here. Then " The following is an extract from the memorandum of my interview written on the 21st April." This is a record of your interview with Mr. Montagu, is it?

A.—Yes. I wrote it the day after I had seen him.

Q.—You handed him the memorandum from which I have read extracts?

A.—I did, yes.

Q.—And he wrote upon it " Sir George has given me a characteristically strongly worded memo. which was for my private information and to which under the circumstances I take no exception. Sir George Buchanan explained that the project was being held up on account of the order not being placed for the dredger and I direct that the papers be circulated and the case be brought up in Council for final decision on Tuesday next."?

A.—That was my recollection.

Q.—Your recollection 24 hours after the interview?

A.—Less than that.

Q.—" Mr. Montagu then talked to me rather freely. He said that he had discussed the Back Bay scheme with Sir George Lloyd, who was sitting in the Chair I was then occupying." You mean " who had been sitting in the chair you were then occupying "?

A.—Yes.

Q.—" Who had been sitting in the chair I was then occupying, and he had impressed upon him the necessity of the work and the importance of its being done by Government.

Mr. Montagu said he was whole-heartedly in favour of the project, which had always been most attractive to him.

I then explained to him my position, viz., that after my scheme had been approved, Sir George Lloyd had asked me whether my firm would be the Engineers as he did not wish the Bombay Public Works Department to have anything to do with the work. I had agreed on behalf of my firm and had promised to make the carrying out of the work my principal object, if necessary declining works elsewhere, and I had agreed to go out and spend several months every winter in Bombay."

Then you discuss the matter of the Grisewood contract, and I think on the 5th May you learned that approval had been given to proceed with the purchase of the dredger?

A.—Yes.

Q.—We know that on the same day that approval was given for the purchase of the dredger, administrative sanction was also given for the scheme itself?

A.—Yes.

Q.—Then you continue : " On the 14th June, 1920, I had a meeting with Sir John Biles and Mr. West from the India Office, and discussed with them the Back Bay dredger and plant. Together we went over the tender and specification for the dredger, discussed the question of the supply of electric current for the relay station, the manner in which the dredger was to be delivered at Bombay and the erection of the pontoons and pipe line at Bombay."

Then you say, " In concluding this summary of the history of the scheme from its inception I wish to record the opinion that there was no undue haste shewn by anyone in proceeding with the work. For many years the project had been discussed and re-discussed and pending its disposal one way or the other it was blocking the development of Bombay. Once the scheme was sanctioned obviously the correct procedure was to get to work as soon as possible and Sir George Lloyd's (now Lord Lloyd) anxiety to see a beginning made at the end of the 1920 monsoon instead of losing another whole year was reasonable. Although not being an engineer he did not realise the amount of preliminary work necessary in all large schemes before operations can actually be begun. Had the work been entrusted to the Bombay Public Works Department it would, I judge, have taken at least three years before anything was done, not on account of the unwillingness or inability of the Engineers belonging to the department, but in order strictly to conform to procedure."

Then you say how they acquired the town planner's lay-out and a complete working project estimate, and you continue, " Our plan of operations was to prepare a general scheme and estimate and the detailed plans and estimates step by step as the work proceeded, a by no means unusual procedure. I said, and it has been proved correct, that the way prices of labour and materials were fluctuating in 1920 made the preparation of a complete project estimate a useless waste of time, unless indeed prices were included which could hardly under any circumstances be exceeded." Prices were fluctuating, were they, in 1920, very much?

A.—Yes.

Q.—And in 1919?

A.—No. The great fluctuation did not begin in 1919.

Q.—Had there been, between 1912 and 1919, a rise in materials, plant and labour, taken collectively, of at least two-and-three-quarter times?

A.—No. I should say that machinery, and so on, rose about two-and-a-half times.

Q.—We have had rather elaborate figures given us in evidence about it from the Director of Stores. I should like you to come up to my figure of two-and-three-quarter times—that, taken collectively, between 1912 and 1919 the price of steel plates, coal, fuel, wages, rolling stock, cement, and all those things had gone up, taken together, two-and-three quarter times over that of 1912?

A.—No, I should not say that.

Q.—Well, two-and-a-half times?

A.—I say two-and-a-half times, generally speaking.

Q.—Two-and-a-half will do for the moment.

A.—Naturally I went into the question.

Q.—In 1919-20 were prices higher than in 1919?

A.—About 1920 undoubtedly prices began to soar.

Q.—In 1919 you were able to give an estimate correct to two points of decimals, were you not—367·61?

A.—Yes.

Q.—If you could do that in 1919, why could not a contractor have given an equally close estimate in 1920?

A.—No, I do not agree.

Q.—Have you taken out a schedule of figures from 1912 to 1922 just to see what was happening all the way through?

A.—I have some general figures.

Q.—There is no difficulty about getting a list of that character, is there?

A.—I suppose not.

Q.—Because we shall have to examine, you know, the rise in prices between 1912 and 1919, to understand if Mr. Kidd's estimate of 325 lakhs was a correct figure, how in 1919 you could do the work for 367. We will have to look into that?

A.—Yes, I shall be delighted to.

Q.—Then we ought also to consider whether there was such a rise in material between 1919 to 1921 as to justify the price of 702 lakhs as the revised estimate?

A.—Yes.

Chairman.—Take your own figure of 668; that will do just as well—in 1921. We might just discuss that a little on Monday.

Sir H. Courthorpe Munroe.—The witness can deal with it now, Sir. He has his notes before him which he can go into, if you care to.

Witness.—I would rather do it on Monday, I think.

Chairman.—I feel I am a little behindhand on this report, and I would rather pass through a few more pages. Now I come to page 53, to your agreement. We have all read what you have said with regard to that. The agreement may have very little practical bearing on the matters we have to decide, and on one important matter it has no bearing at all; but you emphasize, quite rightly, that your position under that agreement was that of engineers and that you were not in the position of contractors. That is the first broad matter, is it not?

A.—Yes.

Q.—After the recitals it begins: "Now it is hereby agreed, the Firm agree to act as engineers to the Secretary of State in carrying out the said scheme and in the construction and execution of all works connected therewith until the final completion thereof; shall at all times assist and advise the Government of Bombay in all matters relating to the execution of the works, and shall supervise the same and undertake and perform all work and duties devolving upon engineers of large works."

A.—Yes.

Q.—"And in particular the following duties." Then it gives a schedule of duties in England and duties in India?

A.—Yes.

Q.—Then there is this very curious passage in the second paragraph of Clause 2: "The resident engineer will be nominated by the firm and will carry out the details of the work in accordance with the firm's instructions." Do you understand what that means?

A.—In the light of events, I must say that I do not understand it.

Q.—Suppose that clause stood by itself, would not it imply that you were to appoint a resident engineer, that you were to tell him what were the details of the work to be done, and that he was to carry out those details in accordance with your instructions?
A.—Yes, if it stood by itself.

Q.—I do not understand it. I do not know whether you can help me about it. It does not seem to me to be *in pari materia* with the rest of the agreement?
A.—No.

Q.—At all events you are emphasising that your position was that of an engineer and not that of contractor?
A.—Yes.

Q.—So be it.
A.—Then, as you are aware, Mr. Chairman, there was an amended agreement later on.

Q.—Yes. I will come to that in a few moments. On the 4th January, 1923, Sir Chimanlal Setalvad had raised the question as to how it happened that the Development Directorate were employing surveyors and draughtsmen, did he not?
A.—Yes.

Q.—And you had a meeting to discuss the responsibility which you were under with regard to the preparation of plans, estimates and so on?
A.—For temporary works.

Q.—You took the point that you could not be called upon to do temporary work for the reason that you were established in England and the work was going on in India, and that you were responsible for the general plans and specifications relating to permanent work?
A.—Yes.

Q.—On page 61 there is the record of what had been arrived at: " After discussion the Hon. Member agreed to the following recommendations which it was understood Sir George Buchanan was prepared to accept "?
A.—Yes.

Q.—(b) is the one. " Messrs. Meik & Buchanan are the engineers for the reclamation and connected works only, and not for roads, drains, lighting and other things necessary for the development of the reclaimed area, but the cost of so much of the storm water drainage system as has to be constructed during the progress of the reclamation is to be included in the amount on which the percentage for the purposes of the firm's remuneration is calculated." Then " The obligation which Clause 1 (*a*) of the agreement lays on the engineers to carry out certain work in London may, with a view to securing a workable arrangement, be held to be confined to the permanent works only of the reclamation, including storm water drains referred to in (*b*). And in order to ensure better co-ordination, all correspondence between the engineers and the chief engineer, Reclamation Branch, should in future be addressed through the Director of Development, a copy of each document being forwarded at the same time for record in the Director's Office." I see there a reference to storm water drains. They were a very important item, were they not?
A.—Are we coming to storm water drains now? They were an important item, yes.

Q.—Yes, I will come to them. Page 29 of your report gives certain figures, " Roads, drains, lighting as per Government Public Works Department estimates, lump sum, 75 lakhs "?
A.—Yes.

Q.—Have you got that estimate here?
A.—I have never seen it.

Q.—Then where did you get the figures?
A.—It was for roads, lights and storm water drains.

Q.—How did you get the figure? Who gave it to you?
A.—I took Mr. Kidd's figure of 50 lakhs.

Q.—I see; now I understand. If you turn to page 13 you will find Mr. Kidd's item No. 5: " Roads, lighting and drains, Public Works Department, 59.45 lakhs "?
A.—Yes.

Q.—Then all you did was to take that statement and add to it 15·55 lakhs?
A.—That was so, yes.

Q.—What was in that you have no idea?
A.—I have no idea at all.

Q.—We have got the documents, and if you would care to have them I think one can assert with safety that there were no storm water drains in them?
A.—I can assure you that I never saw any document.

Q.—So be it.

A.—As there were no other drains, naturally I took it as storm water drains.

Q.—But the storm water drains themselves cost 64 lakhs, did they not—nine storm water drains, 64 lakhs?

A.—The Development Directorate have spent 64 lakhs, yes.

Q.—That would only leave 11 lakhs for the roads and lights and other drains, which would be a wholly insufficient amount, would it not?

A.—A wholly insufficient amount. There was never any intention to include other drains or to include the layout.

Q.—But how do you know, Sir George? If you had never seen the estimate, how do you know what was included in roads, lighting and drains? You say you have never seen it?

A.—No. I always understood that the sewerage was going to be done by the Municipality. It was nothing to do with us at all. We were not dealing with anything except the reclamation. Therefore in my estimate I dealt with one or two main roads and the storm water drains—well, I took Mr. Kidd's estimate.

Q.—You took that; very well.

A.—But storm water drains had never been forgotten. We had never forgotten storm water drains.

Q.—What did you say?

A.—We never, as is suggested, forgot that there would have to be storm water drains. It was not possible at that time to come to any details about storm water drains.

Q.—We must look into this. Did the Development Directorate people, Mr. Lewis or Mr. O'Rorke, write you a letter saying in terms that the storm water drains had been overlooked?

A.—I do not remember what they wrote on the subject.

Q.—The witnesses have been called and they have all asserted in Bombay with the utmost distinctness that the storm water drains were overlooked. That is the way in which they put it, and they point to one or two letters, and they also point to the fact that the storm water drains come to £482,000?

A.—Yes, which is less than 75 lakhs.

Q.—But leaves, as you have said a minute ago, a wholly insufficient provision for roads and lighting and drains. Would it be right, do you think, to attribute to the 75 lakhs about 55 lakhs for roads?

A.—I would not like to say what estimate is attributable to roads, but on the 14th February, 1921, I wrote to Sir Lawless Hepper " A work which is not urgent but must be arranged for is the prolonging of the storm water drains ".

Q.—Where is that letter?

A.—It is a letter dated 14th February, 1921—" A work which is not urgent but must be arranged for is the prolonging of the storm water drains from the present sea front to outside the new wall ".

Q.—Our correspondence begins on the 14th April, 1921.

A.—I daresay I can get you that; I will find out.

Q.—Did you have any answer from Sir Lawless Hepper?

A.—I do not think so. I said " A work which is not urgent but must be arranged for ".

Q.—Is that a letter to him?

A.—It is a letter to him dated 14th February, 1921.

Q.—Have you got a copy of it?

A.—I have only got a cutting. Here it is (*Handing same to Chairman*).*

Q.—I think, Sir George, we must cable to Sir Lawless Hepper about this letter. Could you let Mr. Ewbank have a copy of the complete letter?

A.—I will look up my files and get the complete letter if I can.

Q.—The object of a storm water drain was to carry off, as the word implies, storm water?

A.—Yes.

Q.—Before there was any shutting in of the Bay there were old existing storm water drains?

A.—Yes.

Q.—What had to be done was to prolong them and carry them out to sea until they discharged on the seaward side of the sea wall?

A.—That is right, yes.

---

* See Appendix XI.

Q.—Therefore had not they to be constructed practically at the same time as the sea wall?

A.—Not necessarily.

Q.—You could not begin any pumping until you had your storm water drains in, could you?

A.—No.

Q.—So that the sea wall, cross bunds and storm water drains were all essential before any reclamation could begin?

A.—Not the storm water drains, because in certain cases, I remember (it is on the records) I proposed a method of pumping into an area before the storm water drain was made.

Q.—Did you propose to block up any of the existing storm water drains?

A.—Naturally you could not block up a storm water drain.

Q.—I do not quite follow, because, you see, if you enclosed any area in which there was a storm water drain you would have to prolong that storm water drain before you had any reclamation, would you not?

A.—You could reclaim an area where there was not a storm water drain, or you could divert a storm water drain.

Q.—There is a storm water drain in the military area, Block 8, is there not?

A.—Yes.

Q.—And a storm water drain in Block 1?

A.—Yes.

Q.—And Block 2?

A.—Yes.

Q.—Obviously you are going to begin either at one end or the other?

A.—Yes.

Q.—In either case you have a storm water drain?

A.—Yes. There are methods of diverting storm water outside a particular area.

Q.—But surely instead of diverting a storm water drain the logical thing was to prolong the storm water drain through the sea wall, was it not?

A.—That is what was done.

Q.—But there has never been any suggestion in any of the correspondence that you should temporarily divert a storm water drain, has there?

A.—No, but I should like to refer to Paragraph 123 of my statement.

Q.—Certainly. Will you do so?

A.—" It should be borne in mind that it was not possible to design the drains, cross bunds or locate main roads until more was known about the lay-out of the reclaimed area and the preliminary scheme of Mr. Davidge, the expert town planner was not received by me until March, 1922. After the lay-out had been received and approved by the Development Directorate we wrote to the Chief Engineer and asked for certain sections and levels in order that we could take up the question of the storm water drains and on the 14th September, 1922, the Acting Chief Engineer wrote that he hoped to send us the plans and sections of the storm water drainage area in about a fortnight's time, but in a subsequent letter said that he had been instructed by the Director of Development not to send the plans, as the work was not within the scope of our duties. This seemed to us rather extraordinary as on the 4th July, 1922, Sir Lawless Hepper had written to me as follows: ' Questions of storm water drainage, sewage, lighting and roads in the reclaimed area itself are likely to be more important and to involve much more expenditure than was anticipated, and the proposals and plans connected with these services will be submitted to you '." Meanwhile the Chief Engineer took in hand the designs on his own account. On the 5th January, 1923, I wrote to Sir Lawless Hepper and referred him to the previous correspondence, and said we would like to go into the matter of the storm water drains. " On the 8th January, 1923, the Chief Engineer wrote : ' An inspection of Mr. Davidge's plan indicates the position of the storm water drains for the area of the reclamation. The drains have obviously to discharge under the sea wall and will naturally be placed on the axes of the main avenues running east and west across the area.' And on the 26th January, 1923, he wrote saying that he had prepared a design of the drains after having been told by Sir Lawless Hepper that they would not be included in the work carried out by our firm."

Q.—On the 11th August, 1922, did Mr. O'Rorke write to you : " In the office here I am getting on with the storm water drains lay-out so as to be able to fix the levels of the various outfalls which will have to be made through the wall, and will be sending plans for your approval shortly."?

A.—Yes. That was after the expert town planner had made his lay-out.

Q.—I am suggesting to you that all that it was necessary to do was to carry forward the existing storm water drains through your sea wall, and that the plans for the storm water drains ought to have come out with the plans for the sea wall and the cross bunds, unless they were overlooked. What do you say, Sir George?

A.—I disagree, Mr. Chairman. I have not got a plan of the storm water drains handy, but it was not practicable. It was quite impracticable to take every one of those drains and put it through the wall.

Q.—Mr. O'Rorke, who was then acting chief engineer—Mr. Lewis having fallen ill—writes on the 25th August, 1922: "I am getting out the Budget for next year, and will send you a copy when it is ready. In this connection one very important point appears to have been overlooked"—that is, in the Budget?

A.—Yes.

Q.—"That is, that all the main storm water drains will have to be built simultaneously with the cross walls, because provision has to be made for existing storm water drains discharging into Back Bay before the dredging reclamation commences. Otherwise, these drains will be choked up. I am accordingly allowing for the construction of two southern storm water drains in 1923-24, one through the middle of the military area, which besides draining these, collects two existing storm water drains in the neighbourhood of Roberts Road, and the other one along the district north of the military area." Is not that the clearest indication possible that in Mr. O'Rorke's mind there had been no provision in any estimate, or in any Budget whatsoever for storm water drains?

A.—What date was that?

Q.—The 25th August, 1922.

A.—Surely that was when the detailed project estimate was under consideration? He refers to the Budget.

Q.—The Budget for 1923-24.

A.—He refers to the Budget, but he does not refer to the estimate.

Q.—That is right. The suggestion is that financial provision was not made by Mr. Kidd, was not made by you, or was not made by anybody, until the estimate of 668 lakhs by yourself in February, 1922, and by Mr. Lewis's letter in that year, in his 702 estimate. If you look up your report you will see there is a revised estimate—the report of 1922?

A.—Yes.

Chairman.—It is at about page 13 in that report.

Q.—Have you noticed at page 14 Mr. Kidd says: "Roads, lights, drains, 58 lakhs" in 1912, and yours in 1919, 75 lakhs, following Mr. Kidd without any knowledge of the details on which Mr. Kidd worked?

A.—Yes.

Q.—Then on the 11th February, 1922, you put: "Roads, lights, storm water drains and sewerage, 135 lakhs."

A.—Yes.

Q.—That, you notice, is an increase of 63 lakhs over your 75 lakhs?

A.—Yes.

Q.—And the storm water drains in fact came to 62 lakhs?

A.—Yes.

Q.—Is not that some indication that in your report of 1919 you have, as Mr. O'Rorke says, omitted the storm water drains?

A.—No; I will not admit that. At all events, you have this letter, which I will produce, in 1921 in which I talk about storm water drains.

Q.—When you got Mr. O'Rorke's letter of the 25th August, if that was true it was a very serious reflection upon you, was not it?

A.—He said it was not in the budget.

Q.—"In this connection one very important point seems to have been overlooked, that no provision has been made by anybody for storm water drains." That is the essence of the thing?

A.—Does not he say in the budget?

Q.—"All the main storm water drains will have to be dealt with simultaneously because provision has to be made for the existing storm water drains before reclaiming," and so on. "I am accordingly allowing for them." Put in that way I see what you mean; but what he says is this: "It has been entirely overlooked. Nobody up till now has ever considered the necessity for storm water drains, and therefore nobody up till now has estimated any amount for them." The evidence that was given was that Mr. Lewis did discuss with you in the very early part of 1922 the question of storm water drains, and that it was, apparently, admitted that they had been overlooked, and that you revised your estimate from 75 lakhs to 135 lakhs, subsequently adding the words: "storm water drains" to "roads, lights and sewerage." That is how it is put.

A.—That is how it is put, yes.

Q.—I want you to see the point.

A.—I see the point.

Q.—In Mr. Kidd's estimate for " roads, lights and drains " there is 59 lakhs. In Sir George Buchanan's estimate " roads, lights and drains " there is 75 lakhs. In 1922 Mr. Lewis said: " We called Sir George Buchanan's attention to this. He in his revised estimate put ' roads, lights, storm water drains and sewerage ' ", and it was not until your attention was called to it that you realised that that would have to be a very considerable item of expenditure. That is how it is put.

A.—That is how it was put, but if I may say so, it has not been put correctly.

Q.—When you got this letter from Mr. O'Rorke on the 25th August—you would get it in the middle of September, 1922—saying that one very important point, namely, the storm water drains, appear to have been overlooked——

A.—Overlooked in the budget, I think he said.

Q.—No; I will get it clearer for you if you want it: " In this connection one very important point seems to have been overlooked: that is that all the main storm water drains will have to be built simultaneously with the cross walls." That is what had been overlooked.

A.—That is when he is discussing the budget, I think?

Q.—Yes.

A.—Overlooked in the budget.

Chairman.—No; that is not it. I will give you the evidence in detail.

Mr. Billimoria.—The plans for the storm water drains were not prepared till 1922 or 1923. There are letters written by Mr. Lewis on that subject. In your letter of the 18th April, 1923, you examine the plans for the first time.

Chairman.—It is page 104, dated the 10th December, 1923, in the large bundle of correspondence. Mr. Lewis says: " I notice that Messrs. Meik & Buchanan in their letter make no mention of storm water drains. As they are an exceedingly important item of the work the omission detracts from the value of the proposal." You put forward a certain alternative proposal, and Mr. Lewis makes that comment. When Mr. O'Rorke had stated that the item appeared to have been overlooked, namely, the storm water drains, which was an important point, did you challenge that in any correspondence?

A.—I do not know whether we challenged it in any correspondence, but if we wrote to Sir Lawless Happer in 1921 and reminded him that the storm water drains were a matter for consideration it shows that at all events we had the storm water drains in our minds.

Q.—It does, undoubtedly. That is a matter we will have to ask Sir Lawless Hepper about.

A.—It would be impossible to overlook the storm water drains, because I used to walk there every day and see the water coming out. I have also got a letter to the Director of Development, in which I pointed out that no allowance had been made for sewering the reclaimed area, because it was to be done by the municipality. I still adhere to-day to the statement that the storm water drains were not overlooked. We are rather out of the order of things now, but I made a revised estimate in 1922.

Q.—On the 11th February?

A.—Amounting to 686 lakhs.

Q.—That is right.

A.—Sir Lawless Hepper in his evidence said that I had asked for the estimate back, and added 100 lakhs to it.

Q.—Sir Lawless Hepper put it that your estimate was 568 lakhs?

A.—Yes.

Q.—He thought that you added 100 lakhs to it as a lump sum, and looked at the estimate, and then came to the conclusion that you had spread it over the whole lot. It is obvious that you could not have added 100 lakhs. The point about that estimate, and the only point I am on for the moment now, is this. That is the first time, as far as we know, and as far as we have known up to now, that you had ever mentioned the storm water drains in writing. You gave no plan of them appended to your report.

A.—No; it was impossible to make a plan of them. It would be very interesting if you were to have a plan showing all the outlets that the storm water was coming from, and how they have been collected and put into the storm water drains. You would not find that every outlet has a storm water drain. They were collected together and put into a certain number of storm water drains, the situation of which could not be settled until we had the town planners' lay-out.

Q.—Did you communicate with the town planner and ask him to send you the lay-out?

A.—Well, we got the lay-out as soon as he had got it finished. As to my estimate of the 11th February, 1922, here is the one which I took in to Sir Lawless Hepper, and which at his instigation I altered. (*Document produced.*)

Q.—That is the one that has the words, " storm water drains "?

A.—Yes.

Q.—That is the point that has been made against you so much in Bombay, that the 11th February, 1922, was the first time that you had ever put on paper a single syllable about storm water drains; and that when the matter was mentioned in 1921 you were making no bones about it at all that it had been overlooked by you. That is how it is put?

A.—That is how it has been put.

Sir H. Courthope-Munroe.—May I respectfully call your attention to the terms of the estimate on page 29? The figure of 75 lakhs is given, but against it is the note: " As per Government Public Works Department estimate." Therefore, in strict legal phraseology that is not his estimate at all; but he puts in a figure. He does not purport to estimate anything. He says: " As per Government Public Works Department estimate." I only want to draw your attention to that.

Chairman.—Did you notice the history that Sir George has given of it? He says: " I never had any Public Works Department estimate at all." He has just said so. He said: " I never saw any document."

Sir H. Courthope-Munroe.—Quite so; but what struck me was that speaking of the estimate which he gives of 135 lakhs as being the revised estimate, it would appear to be the first time that he really in fact estimated anything.

Chairman.—It may be so.

Sir H. Courthope-Munroe.—That is the only point I want to make.

A.—In 1921 there is a letter on record showing that I had not overlooked the storm water drains. There is a letter to Sir Lawless Hepper in which I said: " The matter of the storm water drains must not be overlooked." On the 11th February, 1922, here is my estimate: " Roads, lights and drains."

Q.—Surely not. Just read it again?

A.—Yes. " Roads, lights and drains, 75 lakhs." Acting under Sir Lawless Hepper's instructions really I put on sewerage in order to differentiate on making the plans that " drains " meant storm water drains; here is the writing exactly as I did it on the 11th February, 1922: " Roads, lights, storm water drains with sewerage." I have altered " drains " to " storm water drains " to differentiate it from sewerage; but " drains " was always meant to be storm water drains.

Q.—That is how it has been put in Bombay. What they say is, as a result of conversations you agreed that you had omitted storm water drains, and you specifically include them in your revised estimate, and add a sum of 62 lakhs, which is within a few pence, as it were, of the actual cost?

A.—No.

Q.—That is what is said.

A.—I have not got Sir Lawless Hepper's evidence, but Sir Lawless Hepper said that I produced an estimate and took it away and put 100 lakhs on it.

Q.—May I see that document? (*Same handed to the Chairman*).

A.—May I continue with my explanation?

Q.—Please do?

A.—What happened was that this estimate of mine, the original estimate, was for 499 lakhs of rupees. That had in it " Roads, lights and drains 75 lakhs." I maintain that was roads, lights, and storm water drains. I had an interview with Sir Lawless Hepper on the 14th February. I had a long talk with him, and the note in my private diary is: " At office and saw Hepper and had a long talk about my report." What Sir Lawless Hepper said was that he did not want to have the estimates constantly being increased, that he knew from conversation that I had not included sewerage. He was then aware that Mr. Lewis was preparing an independent report; and he asked me to put on my report—he mentioned the figure—about 100 lakhs of rupees. Sir Lawless Hepper and myself discussed how it should be put on, and we put on so many lakhs for moorum topping, and we put on so many lakhs for sewerage, not for storm water drains. In order to make it quite clear I at the time, that is on this date in February 1922, put the words " storm water drains " above " drains " and added " sewerage," so as to show quite plainly that roads, lights, storm water drains and sewerage were included.

Q.—" Sewerage " means drains, does it not?

A.—" Sewerage " means sewerage—sewerage drains, not storm water drains.

Q.—You get on the one hand " storm water drains "—that is one thing?
A.—Yes.

Q.—And drains as the other?
A.—Sewerage.

Sir Frederick Hopkinson.—And surface drains from the roads, as in London?
A.—I would rather like to emphasise this point.

Chairman.—I want you to do so.

A.—My estimate was " Roads, lights and drains," which mean storm water drains. I will show you a letter in 1921 in which I had said that we must not overlook the storm water drains. Then Sir Lawless Hepper said : " You must put on something for sewerage. We do not want to have the estimates constantly increased "; and he suggested the sum that I should put on. I have got in the entry of the 23rd February : " Long talk with Hepper, took back my estimate and put a crore on to it." It was done by Sir Lawless Hepper's instructions. He was the head of the Development Department, and he knew that Mr. Lewis was presumably making up this independent estimate, and he did not want there to be a great difference. He said : " You have not put in anything for sewerage. You must put in something for sewerage." Presumably he knew what Mr. Lewis had estimated for sewerage. Mr. Lewis was not in good health and he asked me to put it on, and here it is : " Roads, lights and storm water drains."

Q.—Was it proper for you in your opinion to put it on or not?
A.—Well, under the circumstances I thought he had already discussed it with the Governor.

Q.—That is not an answer. You were a professional man in Bombay, and adviser to the Bombay Government?
A.—Yes.

Q.—In adding those amounts to your estimate, were you in your opinion acting professionally and correctly?
A.—Yes.

Q.—You were?
A.—Yes.

Q.—That could only be because in your opinion the work would cost that amount?
A.—The sewerage, yes.

Q.—Every addition that you made by which the amount would be brought up to 668 lakhs must in your opinion have been a proper and honest addition to make?
A.—Yes.

Q.—Therefore we can leave it, can we not, that whether Sir Lawless Hepper told you to do anything of the kind, if he told you to do anything improper, you would not have done it?
A.—I should not have done it if it was improper; but sewerage was not within our contract. We were not advising for sewerage. Presumably Sir Lawless Hepper had gone into this matter. He said " Sewerage will cost so much, and I want you to put in so much for sewerage." We were not doing the sewerage; but he did not want to have a number of estimates.

Q.—You notice that in the project estimate of 702 lakhs sewerage is not mentioned at all. Item 14 is : " Equipment of area with roads and lights 49 lakhs. Equipment of area with drains, 27 lakhs. Equipment of area with storm water drains, 64 lakhs "?
A.—Yes.

Q.—There is nothing about sewerage. That is under the item drains?
A.—But that is sewerage.

Q.—It is only 27 lakhs for the whole of those. Will you produce if you can any letter in reply to Mr. O'Rorke's statement that the storm water drains were overlooked, that is that they would have to be built simultaneously with the crosswalls. In fact did they send you their proposed arrangement of storm water drains?
A.—They did.

Q.—That would be permanent work, would it not?
A.—The storm water drains—yes.

Q.—Ought not you to have got out the plans for it?
A.—Certainly we should have got out the plans for it, but apparently Sir Lawless Hepper said we were not to get out the plans for it.

Q.—Why did you not get out the plans for them before 1923?
A.—Because we had not got the town planner's lay-out until March, 1922.

Q.—Then let us get the facts. The plans for this permanent work came from Bombay, and on the 18th April, 1923, you wrote a letter saying : " We have examined the

proposed arrangement of storm water drains as shown on the plans handed to Mr. Halcrow," and then you have a discussion about the design and method of construction.

A.—Is that correspondence in Bombay or London?

Q.—It is in London, April 18th, 1923, Messrs. Meik & Buchanan, 16 Victoria Street, sending to the Chief Engineer suggestions which have arisen after the examination of your suggestions as regards the storm water drains.

A.—Might I ask the date of that letter?

Q.—18th April, 1923.

A.—Might I point out that in January 1923, or before that date, Sir Lawless had said we had nothing to do with the storm water drains: and he is the Director of Development.

Q.—That is true, but my point is this, and I want an explanation of it because it is a point which has been made so much of in Bombay. It is pointed out that you got into the year 1922 even without yourselves having put forward the plans for the storm water drains. It has been said all the way through one of the first things Sir George Buchanan ought to have sent out were plans for the storm water drains. He has never sent them out because he overlooked them.

A.—Well, I disagree. There is sufficient proof in the letter in 1921 that I did not forget them.

Q.—We must telegraph to Sir Lawless Hepper and ask him to look up his files, because that is a letter we ought to be supplied with. I think we can pass on now to your statement: "I will now summarise briefly the work performed by my firm and myself. The dredger was a joint responsibility between Sir John Biles and my firm, otherwise we prepared the plans and specifications for the whole of the permanent works except in cases where the work was prepared by the Chief Engineer without our knowledge or consent. We also prepared a design for the gantry along the line of the sea wall." There has been a certain amount of discussion about that gantry. It has been pointed out that it cost some £90,000, that it was a convenient thing but not essential, and the non-essentiality of it is suggested to be proved by the fact that you did not require a gantry at the other end. What do you say about that?

A.—Well, I say that is matter of professional opinion. The question of the gantry was very carefully discussed with the late Mr. C. S. Meik and myself, and we decided that the gantry was suitable, and we adhere to that opinion.

Q.—It is suitable at the price of £90,000?

A.—It is suitable at the price of £90,000.

Q.—That is the point

A.—That is a matter of professional opinion, and we beg to adhere to our opinion.

Q.—Then on page 63 you point out: "We employed and paid Inspectors, and we furnished the India Stores Department with certificates on which the various contractors were paid." Then you say: "We employed a permanent staff in our office whose time was chiefly devoted to the Back Bay reclamation scheme. The Principals of the firm, and I in particular, devoted a great deal of our time to the work, and other remunerative work was refused or curtailed because of my obligations to visit Bombay. For the purchase of machinery and stores in this country the usual charge in fees is 2½ per cent. on the cost. We agreed to perform the work for 2 per cent. and we have only been paid 1½ per cent, which in many cases has not paid our expenses." Is it by virtue of a clause in the agreement that there was to be a postponement?

A.—Yes.

Q.—"For the dredger we were to receive 1 per cent, and have only been paid ¾ per cent." That is up to this date?

A.—Yes.

Q.—"I give these facts and figures because statements have been made as to the remuneration of my firm on the supposition that it was all profit and that we had no expenses." Running an engineers' office in Victoria Street, going out to India and sending other people out to India cannot be done without a very considerable expenditure of money?

A.—No.

Q.—"I visited Bombay once each year and twice in 1923, and if my visits were not as profitable to Government as they might have been, it was certainly not my fault, as will be seen later on in this statement." Then: "A partner (Mr. W. T. Halcrow) who is specially qualified to criticise the execution of works, visited Bombay in 1922, and made a thorough inspection of the works, and in 1925 we sent our chief assistant, Mr. Settle, an engineer of great experience, to report on the dredging. These visits were outside the terms of our agreement, and at the firm's expense." Did Mr. Settle make a report in writing?

A.—He did; it is going to be given you with his evidence.

Q.—As an appendix to his statement?
A.—Yes.

Q.—Thank you very much. " I visited Bombay last on the 24th October, 1924, and I left Bombay on the 7th January, 1925, for Australia, with the full knowledge of His Excellency the Governor (who discussed Australia with me), Mr. Cowesjie Jehangir the Member of Council in charge of development, and Sir Lawless Hepper. I intended returning to Bombay the following October, but was overtaken with an illness so severe that I was ordered by my medical adviser to go direct to England, as, if I broke my journey at Colombo and went to Bombay, he considered my life would be endangered. I arrived in London in a state of collapse, and sent a medical certificate to Bombay. The Bombay Government thereupon purported to cancel my agreement with the Secretary of State. My medical adviser is prepared to give evidence before the Committee on this point." We do not want any evidence of that character, because any question between you and the Secretary of State as to the purported cancellation of the agreement has nothing whatever to do with us in any shape or form, and is not within the terms of our reference. Now you come to the estimate of September, 1919, and I will read on page 65 : " This estimate was for lakhs 367.61, increased by Government to 400. It was at the time a fair and reliable estimate, and was accepted as such by the Government of India who examined the figures in the P.W.D. secretariat, and also by the Secretary of State who sanctioned the project." The question that occurs to me is whether there was anybody in the P.W.D. secretariat of the Government of India who was capable of following the figures of this work of a highly specialised character. By that I mean Sir Sydney Crookshank and his assistants. Those are the people, are they not?
A.—Those are the people.

Q.—Did you meet anybody there, either Sir Sydney Crookshank or his assistants, who were capable of having any opinion of the value of such a thing as the cost of the sea wall, or the cost of dredging the material?
A.—You must bear in mind that it is usual that they refer these matters very often to the Inspector-General of Irrigation, who is supposed to have knowledge of these matters. Whether they did so or not in this case I do not know. I did not meet the Inspector-General of Irrigation, but it is a very frequent occurrence, or used to be. I do not know whether there is an Inspector of Irrigation to-day, but a few years ago all marine projects would go to the Chief Engineer of Public Works, and if he was not an irrigation man, if he did not know anything about it, he would refer it to the Irrigation Branch.

Q.—You have no knowledge that Sir Sydney Crookshank or anybody in his office ever referred?
A.—I have no knowledge of that.

Q.—Was not the conversation between yourself and Sir Sydney Crookshank really the most perfunctory conversation on his part?
A.—It was not extensive; it was not an extensive conversation, no.

Q.—I use the word " perfunctory " of a man who would not have and could not be expected to have a grasp of the details of this highly technical subject. He was not an expert in it?
A.—No, I do not think Sir Sydney Crookshank was an expert in it, but, as I say, I have no information as to whether he did or did not consult anybody else.

Q.—Then you say : " The estimate was most carefully prepared from data obtained from the P.W.D., the Port Trust." What information had you obtained from the Public Works Department which was built into your report?
A.—Well, I am prepared to give details about that.

Q.—We know, of course, item No. 5, 59 lakhs.
A.—Yes.

Q.—You did not get any assistance from the Public Works Department on that head, because you never consulted them?
A.—No.

Q.—Earlier in the day I did ask you whether you went to the Port Trust people, and you said no?
A.—I beg your pardon ; I think I said I went repeatedly to Mr. Messent.

Q.—" The estimate was most carefully prepared from data obtained from the P.W.D." Let us take that first. Who in the P.W.D. gave you any data from which you prepared your estimate? What is the name of the gentleman?
A.—Perhaps you would like me to read out what I did in Bombay?

Q.—Do you mean between the 19th May and the 31st May?
A.—Yes.

Q.—I should be glad to have that. Will you give me the dates, please?
A.—I arrived in Bombay on the 19th May, 1919, and I left on the 31st May, 1919.

Q.—This is not in your statement?

A.—No, not in that statement.

Q.—This is a new statement which we have not got?

A.—It is a supplementary statement.

Sir Frederick Hopkinson.—This is the one we were promised but which we do not seem to get.

A.—I thought you said you were getting on to this on Monday.

Chairman.—We will follow it.

A.—It is not very much.

Chairman.—We had thought that the statement which was delivered to us would be complete.

Sir H. Courthope-Munroe.—It would have been, but in an inquiry of this kind so much crops up from time to time that Sir George has made some additional notes. These additional notes were made in rather a long form as notes, and I thought it was better to put them under a heading, so that you might have the various headings, and I have had them broken up under the headings.

A.—These are my private notes.

Chairman.—Never mind; will you read it in your own way? We will follow it as closely as we can, and you can give us a copy as soon as it is available.

A.—I arrived in Bombay on the 19th May, 1919, and I left on the 31st May. I spent the greater part of the time in the Public Works Department secretariat, discussing Mr. Kidd's scheme in detail with the Public Works Department officials.

Q.—Who were they?

A.—Particularly Mr. Kent and Mr. Trench. I was there every day, or practically every day, while I was in Bombay. I inspected the site of the works on several occasions. I examined the works in progress in connection with the Kennedy sea face wall, which forms the beginning of the present scheme. I saw Mr. Messent, the chief engineer of the Port Trust, upon several occasions, and got a great deal of information from him.

Q.—When did he die?

A.—He was not dead then. I cannot give you the exact date of his death, but he certainly was not dead then. I obtained prices of stone and other material both from the Public Works Department and Mr. Messent of the Port Trust. The following is a list of the principal questions I asked these officials. I have one of the original lists that I sent out there: Price of coal in Bombay to-day and pre-war. Price of Portland cement in Bombay to-day and pre-war. Price of sand in Bombay to-day and pre-war.

Chairman.—Have you got their answers?

A.—I have got their answers to some of them. Price of broken stone in Bombay to-day and pre-war. Present cost of concrete in mass 1 to 6. Present cost of concrete in blocks. Present cost of basalt masonry facing in quay wall per cubic foot. Present cost of granite coping in quay wall per cubic foot. Present cost of moorum filling per brass at Sewri. Cost per lineal foot of the Sewri retaining wall, with cross-section of same. Fair percentage to add to pre-war dredging costs to bring them to date. Price of basalt rubble in revetment or quay wall work. Whether the steam navvy brought by the Port Trust from the G.I.P. Railway for working at Trombay is a success, and are there any details of the cost? Have the Port Trust any comparison of cost of moorum filling by rail and by water, respectively, from Trombay? Also obtain prices of moorum filling from Improvement Trust. I discussed many of these matters with the officials in question, and I got to know all this information.

Q.—Have you any document from Mr. Trench or Mr. Kent answering those questions?

A.—I do not think I have anything from Mr. Trench or Mr. Kent, but I have from Mr. Johnson, who was in charge of the Kennedy sea face wall. When I got together all the information I could I left for England, and I took in hand the preparation of my report and estimate. In this I was greatly assisted by my late partner, the late C. S. Meik, and by records in our office of the cost of work of all kinds for the last 40 or 50 years. Finally we decided on the prices for construction work at about two and a-half times above 1912 prices. Let me give a few examples to compare Mr. Kidd's estimate with mine. In 1912 Mr. Kidd estimated the cost of the sea wall at 288.15, or 289 rupees a lineal foot. We considered that price high, distinctly high, for 1912; but our price for 1919 for a much cheaper wall was 531.4 rupees, which was undoubtedly ample at that time. In the matter of dredging, the chief engineer of the Bombay Port Trust informed me that the working costs had only increased in Bombay approximately 25 per cent. between 1914 and 1919. Mr. Kidd's estimate for pumped filling, mud and clay, was 9 annas 3 pies per cubic yard. In his evidence he gave the estimated cost of his plant in 1912 at £287,625, which, converted into rupees

at 15 to the £ and divided by 25 millions, comes to 2.7 annas a cubic yard. My 1919 estimate was for a dredger and other plant to cost £451,500. That was the firm offer we had at the time. To reduce that to the 1912 price, that is two and a-half times in excess, and you have £180,600, or exactly £100,000 less than Mr. Kidd's estimate. Let us put on £20,000 for contingencies, boats and barges, and say that the dredger and plant would cost £200,000. That is 30 lakhs divided by 25 million cubic yards, giving 1.90 per cubic yard for plant. Accordingly, the late Mr. Russell, then Secretary to the Government of India's Public Works Department, agreed the figure of 2.16 annas per cubic yard was a fair price for the work and the pipe-lines and dredgers, which he quoted from actual experience. Taking 1.90 plus 2.16, it equals 4.06 per cubic yard against Mr. Kidd's estimate of 9 annas 3 pies. In my revision of Mr. Kidd's estimate, as I tell you, I was assisted by Mr. Meik, who had very great experience. I allowed 5 annas, and we considered that was generous. We considered that on the item of dredging Mr. Kidd had over-estimated by 64.19 lakhs of rupees. In my detailed estimate plant amounts to 3.24 annas, and working expenses 2.66, totalling 5.91; but I add for contingencies 2.09, which should be ample. My point is that we went into the matter as carefully as we could and we came to the conclusion at that time—and we were justified in doing so—that Mr. Kidd's estimate was very gravely over-estimated. As regards the wall, we increased the wall from 288, or whatever it was, to 500; but we considered that he had over-estimated for his dredgers and working costs.

Q.—In fact, did the cost of the " Colaba," the " Sir George Lloyd," the " Kalu," the " Jinga," the pipe-lines and pontoons themselves exhaust the 8 annas?

A.—I am referring to my 1919 estimate, not to what happened subsequently. At my 1919 estimate we did have a firm offer for the dredger at a certain price.

Q.—But in 1919 you estimated that 30 million cubic yards could be dredged for 8 annas a yard?

A.—Yes.

Q.—In fact, did it cost the whole of the 30 million 8 annas to provide the dredging plant, as it turned out?

A.—I can give the reasons for that.

Q.—I am only asking you the question.

A.—Certainly it did, but I do not think that proves my estimate in 1919 at that time was incorrect.

Q.—You estimate that you will provide 30 million cubic yards of material dredged from the harbour transported across the peninsular and put on the reclamation?

A.—Yes.

Q.—That can only be done by the provision of adequate dredging plant, by the provision of crews, by the paying of five seasons' cost of wages, reconditioning of vessels, and so on. Did not the first item of all, the provision of the " Sir George Lloyd," the " Colaba," the " Kalu," the " Jinga," the pontoons and pipe-lines, exhaust the whole of the 8 annas before a single ounce of material had been dredged?

A.—I am not disputing that, but we are discussing now how I got at my 367 lakhs' estimate.

Q.—Would you continue? Would it be possible for us to have a copy of that statement to-morrow?

A.—Yes.

Sir Frederick Hopkinson.—I should like to see all the details.

Sir H. Courthope-Munroe.—I will try and see that you have these figures. I got them out for the very purpose that you should have them. It is almost impossible to follow it unless you have them in front of you.

Chairman.—It is quite impossible.

Witness.—We thought that this part was coming on on Monday.

Chairman.—But we must have a little time to study it. I am going to leave some of these matters to Sir Frederick Hopkinson, and he would like to see the details and have time to study them. Will you bring all the original documents on which you have made the calculations?

A.—I will bring certain documents. With all deference I am not going to lay bare the details of my office working for Sir Frederick Hopkinson.

Chairman.—You must do as you like, but it has been definitely stated by Mr. Lewis and Mr. Elgee that they never saw and they never knew of the existence of any document showing how 367.61 lakhs was arrived at. They were asked over and over again in various forms: " When you were in Sir George Buchanan's office were you ever shown any documents saying how 367.61 lakhs was arrived at? "

A.—There was no particular reason why they should have been told. They joined the work long after that time. There is no particular reason why they should have been informed how the estimate was arrived at.

Q.—Mr. Lewis came over in 1920, you remember?

A.—Yes, I remember.

Q.—Mr. Lewis helped Mr. Meik in the preparation of the plans and the plant, and everything to be ordered?

A.—Yes.

Q.—You went off, I think, to South Africa on the 25th August of that year?

A.—Yes.

Q.—Mr. Lewis says: "I cannot tell you in the least how the 367.61 lakhs as set out in the report was arrived at, because never during the whole period that I was in the office did I ever see any figures."

A.—No; I do not think it was discussed with him.

Mr. Billimoria.—I submit as a Committee we are perfectly entitled to ask Sir George Buchanan to produce these estimates, because the whole scheme was based on the original figure of 367 lakhs. If Sir George Buchanan declines to do that we shall draw our own conclusions.

Chairman.—It is perfectly evident if Sir George Buchanan has got the original figures on which he arrived at the estimate of 367·61 lakhs, he will produce them as a matter of prudence, as a matter of the proper and right thing to do. There cannot be any question about that: there will be no question about it.

Sir Visvesvaraya.—How were the officers to carry on the work if the details were not given to them?

Chairman.—We will follow that out. For the moment the question is that Mr. Lewis said he never saw how this amount was arrived at. If there are figures in existence between May, 1919, and September, 1919, Sir George Buchanan undoubtedly by Monday will produce this original document. Will you continue those figures?

A.—I think that is the end of those figures at present.

Q.—Very well. That is the P.W.D. Have you got any letters from Mr. Kent or Mr. Messent or Mr. Trench dealing with any of these matters?

A.—No, I have not.

Q.—As regards the Port Trust, what were the data which you obtained from them?

A.—I have read out that—data on prices.

Q.—From the Port Trust what did you get? I have not followed that part of it was from the Port Trust.

A.—I practically got all this information from the Port Trust; I got all this information from miscellaneous sources in Bombay, and it was quite sufficient; and with our information at home we got out our figures. As I have said before, Mr. Meik is dead and one cannot call him, and I am not going to produce the records of my office for years and years past or give details more than I have done.

Q.—You must decide; but let there be no misunderstanding about this. You must decide yes or no whether when you are asked on Monday to produce the original figures you will do so. I hope, Sir Harry Courthope-Munroe, that you are listening to this?

Sir H. Courthope-Munroe.—I am listening attentively.

Chairman.—You must decide by Monday, yes or no, whether you are going to produce the details by which you arrived at 367·61 lakhs as set out on page 29 of your report.

A.—Yes.

Chairman.—If you say you will not produce them, well and good.

Mr. Billimoria.—I might point out that he has been paid for it, and we are entitled to these documents.

Chairman.—Do not let us carry it any further than I have carried it; we will wait till Monday.

Mr. Billimoria.—It is only to be perfectly frank that I am saying this.

Chairman.—Mr. Billimoria only wants to put the point to you. I see the point now, that at that time you were being paid to get out this document.

Mr. Billimoria.—It is our property therefore.

Chairman.—It is a good point, and I am sorry I stopped you.

Sir Frederick Hopkinson.—Under his agreement with the Secretary of State, all the documents are the property of the Indian Government.

Chairman.—You will consider it, and Sir Harry will advise you.

Sir H. Courthope-Munroe.—I will think of that. I understand the Committee would like the information he has stated there as to the price of coal pre-war, and the price of stone and cement.

Chairman.—In addition to that, on page 29 of the report you will see there is a revised estimate, and it shows that in Sir George's opinion the work can be done for 367·61 lakhs. Mr. Lewis has said this is a mere skeleton estimate, and, if you look at it, it is.

Sir H. Courthope-Munroe.—It speaks for itself.

Witness.—Will you let us know what you want?

Sir H. Courthope-Munroe.—I want you to follow the Chairman.

Chairman.—What we want is to have the details by which the sums were worked out.

Sir H. Courthope-Munroe.—You would like to have reasonable details of the statement on page 29?

Chairman.—Not reasonable; but the actual original documents of 1919 by which Sir George Buchanan arrived at the figure of 367·61 lakhs.

Sir H. Courthope-Munroe.—What you want to get at is the document showing, to take the first item, that in point of fact the quantity was 79,831, and not some other figure?

Chairman.—Yes; and how he got at that.

Sir H. Courthope-Munroe.—That is what you want to know.

Witness.—How we got at the quantities?

Chairman.—Treat it as a summons for particulars—you know exactly what I mean.

Sir H. Courthope-Munroe.—That is what I was endeavouring to do.

Chairman.—Treat it in that way, I should say: "Particulars of the quantity of 79,831, stating how, and in what manner the same is arrived at, and identifying the document."

Sir H. Courthope-Munroe.—I appreciate that.

Chairman.—Very well.

Sir H. Courthope-Munroe.—I take it what you really want is particulars of that column; there is nothing else?

Sir Frederick Hopkinson.—The prices.

Chairman.—The prices are of some importance.

Sir H. Courthope-Munroe.—Where are the prices?

Chairman.—In the next column.

Sir H. Courthope-Munroe.—Except that item No. 12, which is a lump sum—that I follow, and I will endeavour to get the best information I can about that. But in all these things there is a limit. One does not bring into a public court the whole of one's business. These matters I can deal with I have not the least doubt.

Chairman.—Nobody wants that done, but as Mr. Billimoria has pointed out, Sir George Buchanan was at this time the paid expert of the Government, and he brought these figures into existence by virtue of the relationship between himself and the Government, and they have the right to know how this was arrived at.

Sir H. Courthope-Munroe.—I am not disputing that. You must be satisfied that these are not guesses, but these are figures actually got out in a proper way.

Witness.—I would like to point out that there are no details of prices. Prices are discussed verbally. Perhaps Sir Frederick Hopkinson is under the impression that there was any detail of this estimate, and that it was got out by means of contractors' estimates; but it was not.

Chairman.—That is what we want to know.

Sir H. Courthope-Munroe.—If you have not got any documents, obviously you cannot produce them, and you will tell the Committee so. If you have any documents, it is quite fair that the Committee should see them.

Chairman.—All we want is the documents which form the groundwork from which page 29 was worked out—the calculations. When Mr. Kidd was in the witness-box the same question arose about his prices. He said: "Here is my estimate book; here are all the details"; and he then began to give us all the details, showing how he had

got out his estimate of 325 lakhs. We want a corresponding document to that, if you have it?

A.—Yes.

Sir Frederick Hopkinson.—You may have only one price in that book; but it may be built up of a dozen different things.

Sir H. Courthope-Munroe.—I quite understand.

Witness.—That is from your point of view, but not from our point of view. We do not do things in that way.

Sir H. Courthope-Munroe.—I quite follow what you are asking. You could not put it better than requiring better and further particulars. I quite agree they ought to be given, and I will do my best to get them.

Chairman.—Yes. If your client feels he does not wish to supply them we will leave it at that. At page 66 you state: "Prices were fluctuating, but nobody could see the rise of prices all over the world which would take place the following year."

A.—Yes.

Q.—You will look into that matter and before Monday be prepared to show how the prices went from 1912-1919, and how they went from 1919 to 1921 and 1922, if you like.

A.—Yes.

Q.—You say: "To give one instance, when the dredger was ordered the firm offer of £451,000 had been withdrawn by the lapse of time, and other circumstances combined to raise the contract price to over £650,000."

Sir Frederick Hopkinson.—The price actually was £773,500.

Chairman.—"To over £650,000, payable at Rs. 15 to the £ instead of 12. The Government were aware of this state of affairs and could have called a halt and asked for a re-examination of the estimate before the dredger was ordered had they wished to do so." What did your amount of £773,500 include, Sir Frederick?

Sir Frederick Hopkinson.—That is the "Sir George Lloyd," the "Colaba," the shore lines, and the floating part lines.

Witness.—Does that include freights?

Sir Frederick Hopkinson.—Yes; delivered in Bombay.

A.—I am talking of the £650,000. I will look into that.

Chairman.—I have talked of it as £650,000 because it has been mentioned as that; but Sir Frederick Hopkinson is speaking of the dredgers "Sir George Lloyd" and "Colaba," the shore lines, the floating pipe lines, the pontoons, the anchors, and everything delivered at Bombay.

Sir Frederick Hopkinson.—That is the figure from the Director-General of Stores.

Chairman.—"The Government were aware of this state of affairs, and could have called a halt and asked for a re-examination of the estimate before the dredger was ordered had they wished to do so." As the expert technical adviser to the Government it was also open to you to have pointed out to them the great difference in the few months between October, 1919 and May, 1920.

A.—As a matter of fact, I do not think I knew what the dredger was going to cost until after the order had been placed.

Q.—You knew, at all events, that prices were going up very much?

A.—Yes; and I knew that in Bombay the prices of land were also going up. We come back to the old story—the reclamation had to be done at any price. It was going to be a very remunerative undertaking.

Q.—Although you say the Government themselves could have called a halt you did not indicate that in May, 1920, it might be prudent for them not to go on with this scheme?

A.—I did not.

Q.—I appreciate the reason. It was believed it was going to be lucrative. I think I had better stop there because we get on to the revised estimate of 1921 for 701 lakhs.

A.—Yes.

Chairman.—About the statement that Sir George Buchanan has been reading from, have you got a copy for us?

Sir H. Courthope-Munroe.—I will see that you have that. I want to be perfectly candid with the Committee. It formed part of my brief, and after giving particulars of how the thing is built up, my client has made certain observations to me.

Chairman.—Of course we do not want those.

Sir H. Courthope-Munroe.—Obviously you will appreciate why it was not handed in. It can easily be got by tearing off part which is my instructions and giving you the figures. I will see that that is done. I have got them out now; but that is the sole

reason why they were not handed over the table. There were certain personal notes to me as Counsel and naturally I did not want to hand those over.

Chairman.—That is quite right.

Sir H. Courthope-Munroe.—If we deliver them to-morrow morning will that do?

Chairman.—I think so.

Sir H. Courthope-Munroe.—I will try and get out for you the further and better particulars as far as possible, but of course, it is seven years ago.

Chairman.—We do not want a new mass of particulars. We want the document and for Sir George Buchanan to say it was from this document that it was made up.

Sir H. Courthope-Munroe.—You want to test the *bona fides* of the estimate that was given. That is quite right, and I do not want to complain of it.

Chairman.—That is the point.

(Adjourned to Monday, 1st November, at 11 a.m.).

The Committee Assembled at 11 a.m. on the 1st November 1926, all Members being present.

The examination of Sir George Buchanan was continued.

Sir George Buchanan; re-called and further examined.

Chairman.—When the question arose, Sir George, of taking a shorthand note, we were under the impression that, as you had your Counsel here, you probably would not require it; and it had to be done in a very great hurry. If, however, the absence of a transcript of the shorthand notes of your evidence has put you to the slightest inconvenience, you must withhold any answers to any questions which you like, until you have seen the transcript of the shorthand note. I am very happy to hand to you now if you care to have them, my own copy, with your evidence marked at certain passages, which will give you some indication of what I, at all events, regard as of some importance. Will you just keep these copies, (handing same to Sir George Buchanan). You can return them at your leisure. As I say, if at any time you would rather defer your reply until you have had an opportunity of studying the shorthand note, by all means take that opportunity.

Sir H. Courthope-Munroe.—May I just say a word before you start, Sir?

Chairman.—Certainly.

Sir H. Courthope-Munroe.—On the last occasion when we met, you desired that Sir George Buchanan should give you further information with reference to some particulars that were stated in his report of 1919.

Chairman.—Yes—page 29.

Sir H. Courthope-Munroe.—The estimate which resulted in a figure of 367 lakhs was made up of various items, and I gathered on the last occasion that you wanted to know how the quantities were arrived at. Taking the first instance of concrete, No. 1, you wanted to know how 79,831 yards was arrived at, carrying it through in detail. Then, secondly, you desired to know how Sir George Buchanan came to fix a price, as regards concrete, of Rs. 32. You wanted those details.

Chairman.—I will tell you what we wanted. We wanted the original documents from which he worked out those figures.

Sir H. Courthope-Munroe.—I want to see if I followed you rightly. The position is this. Sir George Buchanan is an engineer, as we all know, of great eminence. He has devoted several months to the preparation of the statement which has been handed in to you, which runs, I think, to something like 117 pages. For that, so far as we know, he receives no remuneration whatever. He is here simply as a voluntary witness to afford information to the Committee. As I say, he has been several months in preparing this statement, and he has tendered himself here as a witness for the last two days. He is perfectly willing to answer any question you may put to him in fairness, but there is a limit. He is not paid to attend here. He is in no sense upon his trial. If you are to go into all these details, he may very well be required to be here for another week or fortnight; and to have all these details gone into, not, with very great respect to yourselves, by a committee of experts in the engineering world, but by your Tribunal——

Chairman.—Sir Harry, would it meet that objection if we said we would limit the examination of page 29 to one-and-a-half hours? That would meet that objection, would it not? That is one objection disposed of, then.

Sir H. Courthope-Munroe.—Sir George Buchanan has not the smallest objection to any document which he has got being seen by the Committee, but he has the strongest objection to parting with, and declines to part with, any original document. He has found a bundle in his office which came into being upwards of seven years ago. He is quite prepared to allow copies of those documents to be taken and for them to be handed to you. He is not disposed to part with the originals. You will see, Sir, that to ask a gentleman, seven years afterwards, to go into all this mass of detail may involve his attendance here at very considerable expense.

Chairman.—If we limit it to an hour-and-a-half, that point goes. All we are asking for is not that he should part with any document at all; we are asking him to hand to this Committee the original documents which he prepared, and so got out this estimate at page 29. Having handed them to us, they will remain in this room for an hour-and-a-half during which his examination is held on those documents, and they will then be handed back to him. There are two questions. Has Sir George Buchanan got those documents: are the original documents in existence? If they are, what reason does he put forward for not producing them?

Sir H. Courthope-Munroe.—May I talk to Sir George for a moment?

Chairman.—Yes. He may decline to produce them if he likes.

Sir H. Courthope-Munroe.—I am not taking up that attitude at all. You will appreciate my point. Sir George cannot hand in every document prepared seven years ago, and come before this Committee and undergo an examination that might easily last into a month. He has other things to do.

Chairman.—I said we would limit it to one-and-a-half hours. Sir George, will you turn to Sir Harry and take his advice about the matter? (Sir George Buchanan consulted with his counsel.)

Sir H. Courthope-Munroe.—I have spoken to Sir George, Sir, and upon the understanding which you have been good enough to suggest, namely, that we should hand the documents to you——

Chairman.—No, hand the documents in to whichever member of the Committee wishes to ask questions, and that the examination on page 29, as regards what you and I understand as particulars, and how they are made up, shall not exceed one-and-ahalf hours.

Sir H. Courthope-Munroe.—And that the documents will not leave the room, but will be returned after the close of the day?

Chairman.—They will be returned to Sir George Buchanan at the close of every day.

Sir H. Courthope-Munroe.—If you please. I want further to point out, as I have already pointed out, that Sir George Buchanan is unable to attend here indefinitely.

Chairman.—We are unable to sit indefinitely also. We have to be considered.

Sir H. Courthorpe-Munroe.—What I want to point out is this. Sir George Buchanan is attending here, and has drawn up this statement in the public interest, and to give the information for which you are asking. He cannot undertake, as a professional man, to attend here indefinitely at his own expense so long as this enquiry may last, and he is desirous if possible, that his examination should close to-day.

Chairman.—You may take it that that is impossible, but I hope I can get on myself to-day in a few minutes and finish by 1 o'clock. I will try to. (*To the Witness.*) I have not been unduly long with you, have I, Sir George Buchanan?

A.—I do not know, Mr. Chairman. What I would like to say is this. I am not prepared to go into the details of all that has taken place in the last seven years by question and answer. You want to have a Board of experts. I have given you all the assistance I can. I have written this statement. I have attended here for two days, but there is a limit to the time which I can spare, and I think that limit has nearly been reached. You have this statement which embodies all my views. I have given you my considered opinion to the best of my ability; and, as I say, if you wish to go into questions affecting professional skill, you require a Board of experts—a Board of Civil Engineers of the same standing as myself.

Chairman.—Have you finished, Sir Harry, or is there anything else you wish to say?

Sir H. Courthorpe-Munroe.—If you will allow me, Sir, I will take a list of the documents so that we may be sure to have them back. I think Sir George has prepared a short statement, have you not, Sir George, showing how the figures are arrived at?

Sir George Buchanan.—Yes.*

* See Appendix XII.

Sir H. Courthorpe-Munroe.—Will you give the Chairman and myself a copy of it? This, Sir, is the original bundle which has remained untouched since 1919 (*handing same in*). Before I sit down I desire to say this, Sir. The following account has been published in some of the Press reports of this case, in particular the Manchester Guardian: " (*The Chairman*). You must decide before Monday Yes or No, whether you are going to produce the details on which the estimate was based. If you say you will not produce them, well and good." I do not complain of that, but now, Sir, Mr. Billimoria is reported to have said this—I did not quite catch it myself—" He has been paid for it. It is our property, and should be produced." Now, Sir, that is an entirely wrong position. Sir George, as an eminent professional man, was called upon in 1919 to make a report. For the purposes of that report he went into considerable detail in various matters and made a considerable number of notes, as I have said, as any gentleman would do. He made his report in 1919, and was paid for that report, and there is an end of it. In 1921, two years afterwards, the contract was entered into; and how it can be suggested that any professional man can be called upon to produce his own private notes, or rather that they belong to the Government, I entirely fail to see. However, I do not want to pursue that. I think the statement was made by Mr. Billimoria in error.

Mr. Billimoria.—I am quite prepared to argue that point, if you want it to be argued.

Sir H. Courthope-Munroe.—However, that being so, Sir George rather resents that suggestion. On the question of the shorthand notes, Sir, I understand you have handed to Sir George the shorthand notes, but we on the other side of the table have rather a grievance. When Sir George agreed to enter into this enquiry he understood that he would be in the future, as in the past, supplied with the shorthand notes, at your orders. Observations are made from time to time which one fails to catch, and one wants to verify them on the following day. We have no shorthand writer here. If this were an ordinary Private Bill Committee before which matters were in contest, we should have a shorthand note taken at our own expense, but inasmuch as in this case we are attending here in the public interest, entirely unpaid, and entirely with a view to clearing up matters to your satisfaction and to the satisfaction of the authorities, we do expect that the shorthand note will be given to us day by day. It may have been by an unintentional error, but we did make application for the notes, and we were refused them.

Chairman.—I have given them to Sir George, and I have helped to clear up the matter as far as possible. If he is in the slightest degree embarrassed by not having had the shorthand notes, he is at liberty to ask to be allowed to reserve any questions till to-morrow morning, by which time he will have had an opportunity of studying the shorthand notes.

Sir H. Courthope-Munroe.—I am very much obliged to you, Sir.

Mr. Billimoria.—Before you begin, Sir, may I point out, with regard to the matter raised by Sir George Buchanan that he does not want to be here indefinitely, that this Committee was held up for a period of more than 12 days for the convenience of Sir George Buchanan. During all that time the Committee were doing nothing. We had come here all the way from India to expedite our work, and we were held up for a number of days for no fault of our own. It is no good alleging now that we are putting Sir George to any inconvenience. On the contrary, we have tried to consult his convenience to the best of our ability.

Sir H. Courthope-Munroe.—On the question of the shorthand note, Sir, I refer you to a letter of the 17th August 1926 sent to us from the India Office. The last paragraph runs in this way: " The Committee state that they have already sent to your firm a transcript of the proceedings up to date, and also a copy of Sir William Hepper's statement, and will continue to keep you so informed." That is what I was complaining of. We have not been so kept informed. I understand you have now very kindly handed copies to Sir George, and that we shall now have the notes.

Chairman.—As a matter of practice, Sir George, the Committee have sent you from India mail by mail all the evidence that has been taken, have they not?

Sir George Buchanan.—That is right.

Q.—That was done with the object of assisting you, and I hope it has been of assistance to you?

A.—It has been of the greatest assistance.

Q.—I am very glad to hear that.

A.—Would you like me to read my statement accompanying the production of the detailed estimate?

Q.—Relating to Page 29?

A.—Page 29 of what?

Q.—Of your report—not of your statement.

A.—May I give you a copy of this for reference? (*Handing document to Chairman*). " My estimate dated 1919 contains all the necessary information to enable any responsible person to form an opinion as to its reliability. It contains very much more detail than Mr. Kidd's estimate, although Mr. Kidd's was supposed to be a working estimate whilst mine was in point of fact the usual preliminary engineering estimate which an engineer makes to his client. It was accompanied by no working drawings and was not supposed to contain details. Mr. Kidd, on the other hand, is supposed to have prepared and submitted a complete detailed working project, which was accompanied by ten sheets of drawings. It was handed to me as such for examination and report. The Government of Bombay, in sending this scheme to the Government of India, had observed the drawings might be considered as complete working drawings which would give sufficient information for examination of the design and for the immediate commencement of the work. All doubtful points had been settled, and the revised estimate might be accepted as completely trustworthy and ample. I repeat that Mr. Kidd's estimate was devoid of detail, whilst mine was full of detail in comparison with the estimate of Mr. Kidd. It is not usual for an engineer to explain in any greater detail than I have done how my estimate was prepared. It contained at Page 13 a comparison of Mr. Kidd's estimate of cost with my estimate of cost for 1912, and under Table B. my estimate of cost in 1919. It also contained at Page 29 the detailed estimate of the cost of the scheme on my lines; that is the number of cubic yards of concrete rubble, concrete blocks, murum filling, etc., with prices affixed against each. I will now describe how I arrived at my estimate to Mr. Kidd's scheme, 1912 ". It really means the comparison of the estimate. " In the first place it was necessary to take out a complete schedule of quantities for Mr. Kidd's scheme, and although Mr. Kidd had given no such schedule in his report, we were enabled to do so by taking Mr. Kidd's drawings, and from them get out *de novo* the whole of the quantities contained therein. This we did, and after putting our rates under each item we arrived at a total of 170·94 lakhs. To this we added Mr. Kidd's item of 59·45 lakhs for roads, lights and drains, and engineers' and contractors' commission, 11·51 lakhs—total 241·90 lakhs against Mr. Kidd's 325·23 lakhs, and we came to the conclusion that Mr. Kidd had over-estimated the work to the extent of 83·33 lakhs. We then went on to our own estimate and dealt with it in a similar way. We took out the whole of the quantities, and from information in our office, affixed what we considered were the correct rates.

Sir Frederick Hopkinson.—This document does not say " and ". It says " We took out the whole of the quantities from information in our office "?

A.—Well, put in the word " and ".

Sir Frederick Hopkinson.—It makes a difference, does it not?

Mr. Billimoria.—I cannot understand the plural number that is used there. This report is signed " Sir George Buchanan " and not by the firm.

Witness.—" and from information in our office affixed what we considered were the correct rates, and we arrived at a total of 367·71 lakhs. Our estimate was based on an increase of two and a half times over 1912. Information I obtained from Bombay, and brought home with me, is as follows: List of prices of work done on the Kennedy sea face in 1912 and 1913 and 1919 and 1920 obtained from Mr. Johnson, Executive Engineer, Presidency, in charge of the Kennedy sea face works; letter from Mr. Messent, Chief Engineer of the Port Trust, dated 30th May, 1919, with a list of prices in Bombay for various classes of work in 1914 and 1919; rate for murum filling, Improvement Trust Scheme, 1919; letter from Mr. Trench, Assistant Secretary to Government P.W.D., Bombay, containing cost of rubble and cost of stone at Port Trust quarries; note by Mr. Trench, Assistant Secretary, P.W.D., concerning cost of Kennedy sea face wall; note giving price of timber by Mr. Pearson; cross-section of the Mazagon Sewri reclamation wall supplied by Mr. Messent, with note of the cost of concrete blocks 1917 and 1919. Above information along with the records in our office of the cost of works of all kinds, enabled us to put prices to our schedule of quantities."

Chairman.—Then you have got here, in this room, Sir George, the original figures by which you worked out this column of quantities?

A.—I have, yes.

Q.—May I have it?

A.—Here is the document (*Handing in same*).

Sir H. Courthope-Munroe.—I think that contains 45 documents, if somebody would check it. I have not numbered them.

Chairman.—Would you like that numbered, Sir Harry?

Sir H. Courthope-Munroe.—I think it would be convenient.

Chairman.—Mr. Ewbank, will you number this document and then hand the file to me?

Sir H. Courthope-Munroe.—Those are original documents.

Chairman.—Thank you. (*To the Witness*). Have you by any chance the ten sheets of Mr. Kidd?

A.—No, I have not. They were returned to Bombay and are not in my possession. They are the property of the Government of Bombay.

Q.—I am not touching on Page 29, Sir George. Your figure was 367·61, was it not?

A.—Yes.

Q.—And Mr. Kidd's was 325·43?

A.—I suppose it was that.

Q.—Say 325. When you went to Delhi did anyone at Delhi ask you how it happened that if Mr. Kidd's estimate of 325 in 1912 was a fair estimate, you were able to do the work in 1919 for 367?

A.—I do not remember at this period of time. It has not impressed itself on my memory.

Q.—The position is rather curious?

A.—Yes.

Q.—The Government of India had rather pledged themselves to the excellence of Mr. Kidd's estimate?

A.—Yes.

Q.—Mr. Russell had spoken in high terms of it. Everybody in the Government of India must have known that between 1912 and 1919 the prices of everything had gone up at least twice?

A.—Yes.

Q.—But they never mentioned it, as far as you can remember?

A.—As far as I can remember they never mentioned it at all. I put two and a half times on to the price. May I look at that book for a moment? (Document handed to witness). *There* is the original document, dated 18th October, 1919.

(*Original document*, 1919, *No.* 1).

Q.—Now, Sir George, if you could have done the work for 367 lakhs in 1919, working back on the basis of prices having risen two and a half times, Mr. Kidd ought to have been able to do it for 146 lakhs, ought he not?

A.—I am not prepared to discuss it in that way.

Q.—I wish to know your view about it. Is not that the fact? If you could have done it for 367 lakhs in 1919, and your own was a fair and proper price, it follows as a matter of arithmetic, does it not, that Mr. Kidd ought to have been able to do it for 146 lakhs?

A.—I do not care to answer the question in that way. I got out a separate estimate on Mr. Kidd's scheme, and I am not prepared to answer the question in that way. You can take my estimate by Mr. Kidd's scheme, and you can take my earlier scheme, but I do not care to make any comparison in that way.

Q.—Are you not prepared to answer it because you realise that 146 lakhs in 1912 would have been an impossibly low figure?

A.—I did not go at it from that basis at all. I took it on Mr. Kidd's quantities and I put my prices to them, and it never occurred to me to work it out that way.

Q.—I am sorry; I may not have made my question clear. What I asked you was, are you not prepared to answer that question because you realise that the work could not possibly have been done for 146 lakhs in 1912? Is that the reason why you do not wish to answer it?

A.—I am prepared to say it could not have been done for less than my estimate on Mr. Kidd's work.

Q.—I will leave it if you say you prefer not to answer the question, and I will put it again so that there may be no doubt about it. If your estimate of 367 lakhs in 1919 was a feasible estimate, and the right and correct figure, that means, does it not, that Mr. Kidd's estimate in 1912 ought to have been 146 lakhs. Do you prefer not to answer that question.

A.—I prefer not to answer that question.

Q.—If the shorthand writer takes that down——

A.—I have already said that my estimate upon Mr. Kidd's scheme was 241·90 lakhs.

Q.—We will have it any way you like. Let us say that 242 lakhs was the rock bed figure of Mr. Kidd's scheme?

A.—That is it, yes.

Q.—Multiply 242 by 2½ and you get 606. Ought not your estimate to have come out to over 600 lakhs?

A.—No.

Q.—Why not—two and a half times 242 is 605?

A.—Well, there are the figures, and you can make anything you like of them.

Sir H. Courthope-Munroe.—Have you put to the witness, Sir, whether he accepts the two and a half times rise in the period?

Chairman.—He says in his own statement two to two and a half, and we have got evidence, Sir Harry, which shows two and three-quarters. Two and a half will do. Yes, he does accept that. (*To the Witness.*) Now I want to come on to a completely fresh point. Will you turn to your report which you have in your hand, at Page 6, lines 10 to 13. If you turn to the previous page you will see that it is a letter from the Government of Bombay to the Government of India of the 6th December, 1911. It is one of the letters which I might describe as letters pressing on the urgency and financial success of the reclamation?

A.—Yes.

Q.—Apparently the letter of the Government of India had been written by Mr. Porter?

A.—Yes.

Q.—Because at Page 6 it says " In Mr. Porter's letter under reply it is stated that experience of reclamation by suction dredging is limited in Bombay " (the word " limited " is in inverted commas). " I am therefore to point out that the large reclamations being carried out by the Port Trust afford exceptionally complete data for estimating work of this kind "?

A.—Yes.

Q.—We must assume, of course, that the writer was honest when he made that statement, must we not?

A.—Yes, it was a Government letter.

Q.—We must also assume, must we not, that he was very ignorant of the performances of the " Jinga " and " Kalu "?

A.—Presumably he was. He was not an engineer.

Q.—But it does not require an engineer to know that if a vessel is guaranteed to do 2,000 cubic yards an hour and does 555, you are getting something less than what you bargained for?

A.—Yes.

Q.—Have you seen the 1915 publication of the working of the " Kalu " and " Jinga "—the official publication?

A.—No.

Q.—There was an official publication said to have been written by Mr. Messent, in which he set out the whole record of these two vessels. We have a copy of it here. The " Kalu," guaranteed to do 2,000 cubic yards an hour, did from 1,196 to 1,426. Mr. Kidd, if you remember, had given the figure of 1,480, and you have referred to that once or twice. Mr. Messent's figure is 1,426. The " Jinga " did from 555 to 1,276, and that was not over a period of a month or two but over a period of nearly five years. Their average output was 1,126, just about 50 per cent. of their guaranteed output?

A.—But yet to-day the Sewri reclamation is looked upon as a great success, and I have never heard the Port Trust complain about the finished work.

Q.—It does not alter the fact that when we are discussing the performances of the dredgers the figures are those which I have given you. Now suppose you had been in command, Sir George, of this particular work—the Sewri work—and you had found that the " Kalu " was giving 1,196 to 1,426 and the " Jinga " 555 to 1,276, and the two together were averaging 1,159, would you have been satisfied with that work?

A.—I should have said just the same as I say about this work. It is the human element. We have Mr. Kidd's evidence when he had a Port Trust dredger; he talks about the wonderful effect of a little encouragement. When he had a Port Trust dredger she did far more work and gave a better output than she had done compared with the very best output of the Port Trust. We have the evidence of one of the dredger masters. When he was asked about the " Sir George Lloyd " and about dredging elsewhere, he said, " Well, elsewhere they are out for blood: they are out for their pound of flesh, and if you do not get the percentage you get the sack." My opinion about the Port Trust dredgers is the same as about this dredger. Work done by Government, with Government control, is a very different proposition to work done by a contractor or a private company who have a free hand with their men. I do not attribute any importance to these figures.

Q.—Very well. You are satisfied with them as the performances of the " Kalu " and " Jinga," are you?

A.—I am not satisfied with them, but I say you have to take everything into consideration. I say that the human element has not been given the proper consideration.

Q.—Did you know of these figures when you wrote your report in 1919?
A.—No, I did not.

Q.—But why not?
A.—I have often discussed generally the dredging with Mr. Messent.

Q.—But it was in a public document?
A.—It was not put before me. I never saw it.

Q.—You were in Bombay—true for a fortnight only—but you were in Bombay making enquiries about the feasibility of this scheme. You were aware that there had been very extensive dredging operations carried out by the Port Trust—by the " Kalu " and " Jinga " in fact—and even if you did not see the document did you make any enquiries of anybody as to the figures of output of those two vessels?
A.—No, I did not. I had frequent conversations with Mr. Messent. Mr. Messent certainly never once gave me to understand that he was dissatisfied with the Sewri reclamation. I always understood it was a great success.

Q.—Your conversations, I suppose, consisted of questions and answers?
A.—Well, the usual conversations which people have, yes.

Q.—Was not the first question that you should have put to him in any conversation " What have your dredgers done "?
A.—I cannot remember all that I did say to him.

Q.—If you had asked him what his dredgers had done he, having written the official account, would have given you these unhappy figures?
A.—Mr. Messent never gave me a single indication that he was dissatisfied with the " Jinga " and the " Kalu." Possibly he was aware of the failing of the human element.

Q.—Returning to the passage I read—" I am therefore to point out that the large reclamations being carried out by the Port Trust afford exceptionally complete data for estimating work of this kind," that is a commendatory statement, is it not?
A.—Yes.

Q.—Would you have included that in the Report if you had known that the " Kalu " and " Jinga " had done this poor output?
A.—I merely included all this in the Report as a record.

Q.—Yes, but would you have thought it fair to include that commendatory statement in the record if you had known of the poor figures of output of the " Kalu " and " Jinga "?
A.—I should have put it in the record, certainly. This was merely an historical record.

Q.—But if in your own mind you knew that it was a mis-statement, would you have put it in your report?
A.—I did not put it in my report. I merely quoted a document.

Q.—I am trying to make it clear. Somebody makes a commendatory statement?
A.—Yes.

Q.—If you had had full knowledge of the facts you would have known that that commendation was misplaced. If you had known of the figures of the " Kalu " and " Jinga," would you have put that commendatory statement in without some remark that it was over sanguine, or something of that sort?
A.—If I had taken any notice of it at all I should have analysed it and have gone into the question of labour, machinery and material.

Q.—The human element?
A.—The human element.

Q.—I suppose whenever you did any dredging operations you were always up against the human element?
A.—I have been rather fortunate in the human element.

Q.—Were you aware that, generally, people doing dredging operations were up against the human element?
A.—Yes.

Q.—And that it was always rather a serious problem?
A.—Always rather a serious problem.

Q.—Why did not you mention that in the report?
A.—We are sanguine. We think we can get beyond the human element. When I was in Mesopotamia we did enormous dredging operations but we did not have any trouble with the human element there. Perhaps you would like to know why, Mr. Chairman,

Q.—If you wish to tell us by all means do so, Sir George, certainly.

A.—In Mesopotamia we were under military control and military law. On one occasion we did have trouble with a dredger. The whole of the crew said they would not coal the ship, and they were all sent to the Provost Marshal and suitably dealt with. We had no more trouble in Mesopotamia.

Q.—There, I suppose, the men considered that an inhuman element, did they not?

A.—In Rangoon, where I was carrying out the river training works, I was fortunately in the dual position of Sir Lawless Hepper and Mr. Lewis. I was Chairman of the Port Authority and I was also the Chief Engineer. It was a one-man show, and a one-man show you are perfectly aware, Mr. Chairman, is very different from divided authority.

Q.—Did you ever work out the cost of the dredging at Rangoon?

A.—I cannot remember.

Q.—I am told it cost 1s. 6d. a cubic yard. That was pretty high, was it not?

A.—I do not think it is fair to take any figures by themselves. You could take figures from anywhere, Mr. Chairman, and say, "Look at this and look at that." It is not fair to take any figure unless you know the whole of the circumstances.

Q.—So be it. Did Mr. Messent ever tell you about any difficulties which had arisen with the port dredger?

A.—I can assure you that he never did. I was taken to the Sewri reclamation and shown the results as a great success.

Q.—In the same letter it is said, "Further, the Government are well aware that economy in this class of work can only be secured if the suction dredgers and other plant required shall be of the best design. The difficulties which have arisen with the Port Trust dredgers serve as a warning on this point." When you saw that passage in the letter, did it never occur to you to inquire from Mr. Messent what were the difficulties which had arisen with the Port Trust dredgers?

A.—Mr. Messent was a very old friend of mine, and I was in Bombay when the works were going on. He never told me there was any difficulty at all with the Port Trust dredgers.

Q.—I have not interrupted you, Sir George, but that does not really meet the point of my question. The point of my question is, when you saw in this Government letter, "The difficulties which have arisen with the Port Trust dredgers serve as a warning on this point"—that is, "The suction dredgers and other plant must be of the best design"—did not you ask Mr. Messent, "What does that mean; what difficulties have you had with your dredgers"?

A.—No, I did not.

Q.—Look at it from another point of view, "The suction dredgers and other plant required shall be of the best design. The difficulties which have arisen with the Port Trust dredgers serve as a warning on this point." Those Port Trust dredgers you knew to be the "Kalu" and "Jinga"?

A.—Yes.

Q.—You knew them to have been built by Messrs. Simons?

A.—Yes.

Q.—You saw that this was some criticism of these dredgers?

A.—Yes.

Q.—Did you enquire of anybody what the trouble was about the dredgers built by Messrs. Simons?

A.—No.

Q.—I will now turn to your statement, page 66. You are dealing with the engineer's revised estimate of 1921. He brought his out at 702, did he not?

A.—He did, yes.

Q.—And you, a few months later, in February, 1922, brought yours out at 668?

A.—I think it was the other way about.

Q.—So be it; I do not mind which way you put it?

A.—As a matter of fact, my estimate was never considered by Government at all.

Q.—That, again, is not quite my question. I am asking you, did you not in February, 1922, say that the work ought to cost and would cost 668 lakhs?

A.—I did, yes.

Q.—In point of fact, it was before that date that you were told that the project estimate of Mr. Lewis's would be 702 lakhs?

A.—No, I do not think it was before that.

Q.—Look at your own statement: " In August, 1921, we were astonished to receive from the Chief Engineer revised estimates for the Back Bay scheme amounting to seven crores." That is on page 66, at the very bottom?

A.—Quite right.

Q.—Therefore, in August, 1921, you were aware that the engineer thought the scheme would cost 702 lakhs?

A.—Yes.

Q.—In February, 1922, you, yourself, said 668?

A.—Yes.

Q.—It is only a difference of 5 per cent., is it not?

A.—Yes.

Q.—Had you really, or have you even to-day, any great objection to the 702 lakhs? You have said somewhere in one of your documents that you agree generally with Mr. Lewis's figure?

A.—I go so far as to say that I think, under better executive control, that the work should not have cost that.

Q.—It might have been brought down to 668?

A.—It might have been brought down considerably.

Q.—It might have been brought down to your figure of 668?

A.—My figure of 668 was on actuals supplied by Mr. Lewis.

Q.—You signed your name to it?

A.—Yes, I did.

Q.—You accepted it?

A.—I accepted it, yes, but I accepted it on the work that was done. That Mr. Lewis, or that the Executive, had been extravagant was not my concern.

Q.—Did you, at that date, ever put into writing any allegation that there had been extravagance—at that date?

A.—I protested against the 702 estimate

Q.—Did you say it was extravagant?

A.—I think I used those very words.

Q.—Will you let us see it?

A.—There is a long letter which we wrote complaining about that estimate. I have not got it beside me.

Q.—Do you know the date of it?

A.—The 26th July, 1922.

Q.—Are you referring to the report dated 26th July, 1923?

A.—No.

Q.—I have not got that letter?

A.—I am referring to an official letter that we wrote on the 26th July, 1922, in which we went into some details, and we refused to accept the estimate. I can obtain the letter for you.*

Q.—Thank you, very much. Were you of the opinion that the 702 figures were, more or less, all right?

A.—The 702 figures were, more or less, all right? Well, we considered that the work——

Q.—No, no, I mean the price. Were you of opinion that Mr. Lewis's figure of 702 lakhs was more or less correct?

A.—How could we, when we said it was excessive?

Q.—I am asking you, because you said in your report on the revised project estimate, " So far as I can see, Mr. Lewis's figures are generally acceptable "?

A.—Yes. That is after the work was nearly finished. That was the revised estimate. That did not imply any criticism of what he had done in the past.

Q.—It implies acquiescence in his figures, does it not?

A.—What date was that?

Q.—1924—the last report we have. It is dated the 15th December, 1924. I will read the whole passage. " A revised project estimate for the whole work was submitted by Mr. Lewis, the then chief engineer, in July last, and was sent to us for our remarks, when we replied that the matter would be taken up by me on my return to Bombay. The sanction project estimate amounted to Rs.7,02,43,321, and the revised estimate Rs.7,26,54,401, an excess of Rs.24,11,080. There had been material savings in several directions . . . . I have gone into the matter very carefully with the chief engineer and understand he wishes to submit his revised estimate after the receipt of the actuals at the end of the financial year. So far as I can see, Mr. Lewis's figures are generally acceptable, except that the cost of dredging and filling must be an uncertain quantity

* See Appendix XIII.

until we have had the experience of this season's work, and that, in any case, there must be added the sum of 3½ lakhs for removal of cables in Back Bay, and to dredging plant 5 lakhs for the intermediate pumping station to work the "Kalu" if that is approved, Mr. Lewis having already allowed 5 lakhs." There is no criticism there of extravagance or inefficiency, is there?

A.—There could not be. It was not possible. Allow me just to explain for one moment. The 702 lakhs estimate had been accepted by Government. That was done. It was accepted by Government. Very well. Let bygones be bygones. What we were referring to were the differences between 702 lakhs and the 700 and whatever it was.

Q.—726?

A.—The 702 lakhs estimate had been accepted by Government. No one had objected. That estimate was accepted by Government. Naturally our acquiescence was in the difference between 702 and 724.

Q.—We will pass away from it with this question—that your objection to the 702 could not have been of a very serious character, because you yourself at the same time were estimating 702 less 5 per cent.—668?

A.—Yes, but on Mr. Lewis's figures. May I read a little memorandum on the subject?

Q.—Please do. We have not got it, have we?

A.—I will give you a copy of this, Mr. Chairman. The 700 lakh estimate was not our estimate and was sanctioned without our being consulted. However, it was an estimate for work sanctioned by the Government of Bombay with full knowledge of all the facts before them, and of the prices that they expected to get from land sales. However, the responsibility for sanctioning that estimate must rest with the Government of Bombay. You are probably aware that even on that 700-lakh estimate an enormous profit was expected from land sales. It was common knowledge that the 367-lakh estimate, which had been increased by the Government with my consent to 400 lakhs, would have to be further increased. Prices of labour and materials had soared upwards in the years between 1919 and 1922, and the cost of dredging plant alone had increased by something like 100 per cent. for various reasons. Even the special Sub-committee appointed by the Government of Bombay to report on the scheme remarked in their report dated November, 1925, with reference to the 702-lakh estimate: "The excess was due to the fact that since Sir George Buchanan prepared his estimate the prices of work and of materials, fuel and labour had risen considerably. Also Sir George Buchanan's estimate had been based on exchange at 12 rupees to the £; whereas, when the plant was imported in 1921 the rate was in the neighbourhood of 15 rupees to the £. However, let us go over a few main items. Sea wall: my estimate for the wall was 118 lakhs of rupees. The chief engineer's estimate was 238 lakhs, which is above 100 per cent. increase. I have always considered the wall cost considerably more than it need have done, but the chief engineer's point of view was: "I have got that estimate sanctioned by the Government, and so long as that estimate is not materially exceeded it is justified." That is the common view in India. The fact that by economising and keeping cost accounts he could have saved on the estimate did not interest him; but my revised estimate based on the chief engineer's figures was 200 lakhs, a difference at 15 rupees to the £ of £250,000. It should, however, be borne in mind that these figures are gross. No allowance is made for the recoveries and sale of plant, or for the use of the Kandivli quarry for many works outside the Back Bay reclamation, or its sale as a going concern. The quarry was particularly well equipped for that reason. It was never intended that the quarry should be debited *en bloc* to Back Bay scheme. The Director of Development had great ideas as to its use, and a geologist reported upon the value of the stone for building purposes. I wanted a suspense account opened for the quarry and the stone sold to the Back Bay scheme on a proper basis, or rather, I suggested it, but this was not done. Beginning the wall at both ends certainly added materially to the cost. On the other hand, I consider that even with my very limited powers I saved a great deal on the wall, and the chief engineer's estimate would have been exceeded but for my advice.

Sir H. Courthope-Munroe.—May I hand you, Sir, a copy of this statement?

Chairman.—Thank you. (*Same handed*).

A.—The equipment of the reclaimed area, the 700-lakh estimate, has 212 lakhs under this head. My original estimate for 367 lakhs has 75 lakhs for roads, drains, and lighting—storm water drains, please note. Nobody in this world could have prepared an even approximate estimate for the whole of this work before the Government had decided what they were going to do with the land reclaimed, and it was not until March, 1922, that the town planner's lay-out was received by us. Mr. Kidd had allowed 50 lakhs for roads, drains and lights, and I increased his estimate.

Q.—59 lakhs?

A.—Was it 59?

Q.—Yes.

A.—I increased his estimate to 75 lakhs. This was for storm water drains and a few necessary roads and lights. Sewerage I always understood would be done by the municipality. Then I go on to what I said the other day, that in my revised estimate I, in the first instance, included 75 lakhs, but Sir Lawless Hepper sent for me and said he did not want always increasing estimates, but asked me to put on 100 lakhs for sewerage and moorum.

Q.—It was on that typewritten document that you put in pencil " Storm water " right over the top?

A.—Yes; the deficiency.

Q.—Sewerage?

A.—Yes.

Q.—In pencil?

A.—Yes.

Q.—You took out the figure " 75," and substituted " 135 "?

A.—Yes.

Mr. Billimoria.—May we have this document as an exhibit?

Chairman.—I will ask that in a moment.

A.—Dredging plant: my original estimate was 58 lakhs for the dredging plant. My revised estimate was 110½, to which was added the " Kalu " and pipe lines 17¾, totalling 128·38 lakhs. The chief engineer's estimate was 142 lakhs. That has since gone up to 162 lakhs, the " Kalu " and pipe lines having cost no less than 31 lakhs. I think the purchase of the " Kalu " was bad business. If she had been properly inspected prior to the purchase she certainly would not have been bought; but I had nothing to do with the inspection or the purchase. The increase in the cost of the " Sir George Lloyd " over and above my original estimate was, as I have explained, unavoidable. Dredging cost: this was originally estimated by me at 3.66 annas per yard, and in my revised estimate I allowed 5 annas per yard. The chief engineer always estimated 5 annas per yard, and I think the work should be done for that amount. To make any sort of comparison between the 367-lakh estimate and the 700-lakh estimate the following deductions should be made: equipment of the reclaimed area, 136 lakhs. That is, equipment of the reclaimed area with sewerage.

Q.—Was that equipment of the reclaimed area included in the 702 lakhs?

A.—It was.

Q.—But not included in the 367?

A.—But not included in the 367. The equipment of the reclaimed area was 136 lakhs, the purchase of the " Kalu " and pipe lines, 20 lakhs, and the additional cost for beginning at both ends was 15 lakhs—these are merely round figures—making 171 lakhs. 700 minus 171 equals 529 lakhs, or a little over 30 per cent. in excess of 367.

Q.—Not 129, surely, but 132, is it not? It is 702 minus 171, making 531?

A.—Yes. The point to which sufficient consideration has not been given is the general condition of world finance and the fluctuations in exchange between 1919 and 1922. In January, 1913, the rupee was 1*s.* 4*d.* and three thirty-seconds. In June, 1919, it was 1*s.* and thirty-one seventy-thirds. In February, 1920, it was 2*s.* 9*d.* In December, 1920, it was 1*s.* 5*d.*, then falling to below 1*s.* 4*d.* In London the bank rate was 5 per cent. in November, 1919, and rose to 6 per cent. in April, 1920, and was 7 per cent. from 15th April to 28th April. In June it was 6½ per cent., and the end of July it was 6 per cent. The dredger was ordered in June, 1920, and most of the other plant in 1920, in fact, at the very top of the temporary trade boom; but I do not believe they were paid for in India until the rupee had fallen to something like 1*s.* 3*d.** These great fluctuations necessarily increased any estimate, and I hope that my other witnesses will bring examples of the increases of estimate in the case of independent estimating.

Q.—Are those statements ready?

A.—They are ready. I am just waiting to deliver them. Mr. Mattingly shakes his head, but so far as I am concerned they are ready.

Q.—May we have them by to-morrow morning at half-past 10? We are not making any complaint at all, but you gave us a statement which was extraordinarily full. Sir Harry will bear me out when I say that you have been putting in statements each day which have come rather as a surprise to us. I have no doubt they will help us, but we have not had time to fully consider them. That is the only difficulty.

A.—Yes.

Sir H. Courthope-Munroe.—I quite appreciate that.

* See Appendix XXII.

Chairman.—If Mr. Halcrow and Mr. Settle come, as we hope they will immediately on the conclusion of your evidence, we want to have had sufficient time to read their statements and appreciate them

A.—They are not long statements, I may tell you.

Q.—If you say they are ready, and Mr. Mattingly says they are not, for the moment we prefer you to Mr. Mattingly, and we should be glad to have them?

A.—I think we can promise them, so far as I am concerned, at the very latest by to-morrow morning.

Q.—That will do for us.

A.—These great fluctuations necessarily increased any estimate, and although machinery and plant only accounted for a certain proportion of the expenditure on the Back Bay Scheme, the following figures are of interest. Now this is a table which I have prepared, showing from January, 1913, and various dates to October, 1926, how much 400 lakhs of rupees would be in sterling and dollars. Briefly, the difference in sterling was this : 400 lakhs in 1919 in sterling came to £3,328,125 ; but 700 lakhs in 1922 only came to £4,648,000. Assuming that the expenditure was in sterling or dollars, that was only £1,320,000 difference between 400 lakhs in 1919 and 700 lakhs in 1922.

Q.—Through the appreciation of the rupee?

A.—The appreciation or the depreciation of the rupee.

Mr. Billimoria : May I point out that those figures do not throw any light at all on it, because the 400 estimate contained only a very small proportion for plant. This is in sterling and the rest is all in rupees, so that is no comparison at all.

Chairman.—We must remember that.

A.—If you will allow me to say so, I have said that. I have said : " These great fluctuations necessarily increased any estimate, and although machinery and plant only accounted for a certain proportion of the expenditure on the Back Bay Scheme, the following figures are of interest." These figures are produced in my attempt to assist you.

Q.—Will you continue?

A.—I apologise for these notes not all being included in the statement.

Q.—I understand it.

A.—As a matter of fact you said you must have the settlement by a certain time, and I have been working overtime getting out supplementary notes.

Q.—The case shifts from day to day?

A.—Yes. That is all I have to say.

Q.—Have you a complete copy of that which you have been referring to for us?

A.—Yes. (*Document handed in.*)

Chairman.—You were telling us, as one of the incidents of the building of the sea wall from both ends, it was necessary to have 2,000 tons of stone brought down from the Kandivli quarries, with the consequent increase of the plant at Kandivli. You remember that?

A.—I remember that; but Mr. Halcrow is going to give further evidence on that point.

Q.—May I take it very shortly from you? Did the Development Directorate put forward in a letter of the 17th March, 1922, a list of additional plant required for the Back Bay Reclamation Scheme? It is page 40 of the large bundle of correspondence?

A.—Yes.

Q.—You see there four-wheel locomotive, six-wheel locomotive, Ruston No. 20 crane navvy, and so on—a whole lot of things?

A.—Yes.

Q.—Did you come to the conclusion that many of these things were not necessary at that moment, and that some of them were not even necessary at all?

A.—Yes.

Q.—Will you look at your letter of the 11th April, 1922?

A.—Yes.

Q.—That is the letter in which you are asking them to hold their hand about incurring expense. You asked Mr. Lewis to discuss this letter with the Director. That is your cablegram?

A.—Yes.

Q.—That was with the object that if possible the Director should realise that not all of this plant need be ordered?

A.—Yes.

Q.—" We fully understand that as the work is being done without a contractor, great weight must be attached to the wishes of the Engineer on the spot in the matter of

plant and plans for execution, and we have no desire in any way to hamper you. On the other hand, it must be remembered that in addition to the actual capital cost of the plant, interest for maintaining it has to be paid, and it is desirable to economise wherever it is possible to do so without interfering with the efficiency or speedy execution of the work ''?

A.—That is right.

Q.—You wrote a letter on the next day wishing them to choose a cheaper and less powerful type of engine?

A.—Yes.

Q.—Eventually there came a telegram of the 3rd May, 1922, in which they pressed for everything that they had put in their previous letter of the 17th March, excepting one crane, I think?

A.—That is correct.

Q.—There you were clearly holding a restraining hand over them, were you not?

A.—I hope so.

Q.—It is obvious, is it not?

A.—Yes.

Q.—In this particular instance they thought, being on the spot, that they really wanted all that machinery?

A.—I would also like to point out that the letter begins : " I enclose a list of plant required, with the request that you ' take tenders for the various items and arrange for shipment.' " We are not asked our opinion.

Q.—That is true.

A.—We gave it voluntarily.

Q.—You gave your opinion, and told them that they must be economical; and you gave reasons as to why at the moment some of these things were not necessary?

A.—Yes.

Q.—Do you remember any other letter of that kind where you were advising them not to spend unnecessary money?

A.—I could not say without consideration, but probably there is.

Q.—If you can find any other letter, I wish you would let us have it. I will tell you why. You remember that you wrote a letter to the Press, did you not, in which you said: " For years I have been struggling against extravagance and inefficiency ''?

A.—Yes.

Q.—There may be other letters, but this is the only letter that I know of in which you are suggesting to them that they are spending much more money than is necessary. If there is any other letter, I would like to have it?

A.—I state very plainly that I was never in Bombay without remonstrating to Sir Lawless Hepper. If Sir Lawless Hepper was here, I should be very glad to examine him on that.

Q.—What effect did that have upon him?

A.—It did not have any effect.

Q.—Then would you have had any difficulty in getting an interview with the Member in Charge?

A.—Sir Lawless Hepper did not like me seeing the Member in Charge.

Q.—What did it matter?

A.—He was the head.

Q.—You were the Technical Adviser to the Indian Government. You were the great expert there. You advised Sir Lawless Hepper to do something and he did not do it. Was not it your duty to go and see the Member in Charge? There would have been no difficulty in seeing him?

A.—Well, I did not. You may take that as you like.

Q.—Equally there would have been no difficulty in seeing Lord Lloyd while he was Governor. You could have gone and got an appointment from his Private Secretary, could you not?

A.—Sir Lawless Hepper always considered he was the king, so far as anything of that kind was concerned. I did not go and remonstrate to the Governor. I admit I did not remonstrate with the Governor.

Q.—I suggest a visit to the Governor would have deposed the king. I want to follow that out. You would have had no difficulty whatever in getting an interview at any time with Sir George Lloyd, nor would you have had, as I suppose you would agree, the slightest difficulty in getting an interview with Sir Leslie Wilson? They must give you one. If you had gone there and told them what you now say was

happening, you would have to put to them the alternative : " Either Sir Lawless Hepper or Mr. Lewis goes, or I shall go." You never pressed matters to that extent?

A.—I never pressed matters to that extent.

Q.—In that letter also you speak of mishandling the dredger. " Mishandling " is the word used?

A.—Yes.

Q.—I dare say you noticed in the evidence in Bombay, when we called Mr. Speirs, and all these dredging-masters and assistant dredging-masters, Mr. Brims and everybody, each was asked the question : " Did Sir George Buchanan ever make any complaint to you that the dredger was being mishandled "? And each and all of them said that it was the other way, and that you were praising them for what they were trying to do. Do you happen to recollect whether you made any specific complaint that the dredger was being mishandled, and if so what and when?

A.—I do not think I ever made any specific complaint. One does not want to go and crab men who appear to be doing their best. My remarks about mishandling were made after a witness who will give evidence had written to us his report, who went out specially to make an examination for us. He will give evidence on the subject.

Q.—Going back to the plant, there were three Ruston steam shovels there?

A.—Yes.

Q.—Have you been to the Kandivli quarry frequently?

A.—Yes.

Q.—Do you remember as you approach the sheds there is the Bucyrus shovel there?

A.—Yes.

Q.—And three Ruston shovels?

A.—Yes, I know—Whitakers they are.

Q.—Did the Bucyrus cost £9,000?

A.—I believe it did.

Q.—Did the other cost £3,000 each?

A.—Something like that, I should think.

Q.—£18,000 in all?

A.—Yes.

Q.—Has any of them ever done a day's work as shovels?

A.—I do not think they have. I should like to point out, there is no reason why the Bucyrus shovel should not have worked.

Q.—The evidence was they did try to get it to work. They got a man who tried to operate it, but they had not got a man who could operate it. Then they came to the conclusion also that the face of the quarry was not wide enough. Here the fact is that neither the Bucyrus shovel nor the rest of the £18,000 worth of plant ever did one day's work as shovels?

A.—You may take it from me that they never tried to work the Bucyrus shovel.

Q.—When you went there, did you tell him to try to get it going?

A.—Frequently I said to Mr. Lewis : " What on earth is the good of all this plant if you do not make use of it? "

Q.—Then why did not you go up one day and say : " I am coming up on Tuesday, and let me see that working here at 12 o'clock when I arrive "?

A.—I was not in executive control of the work, and I had no power to order Mr. Lewis to do anything at all in connection with the carrying out of the work—I had no power whatever.

Q.—I am a little puzzled about it. I know it was somewhat of a difficult situation there, but I should have thought if you had gone to Sir Lawless Hepper and said : " You have got £18,000 worth of plant lying there. There are three steam shovels and they have never done a day's work as steam shovels," and had said : " As the Technical Adviser to the Government, and as the person who is bound to assist the Government, I suggest to you that Lewis starts on Monday morning with these shovels, and you and I will go up and see them being worked——"

A.—But Sir Lawless Hepper had already sanctioned the purchase of shovels against my advice.

Q.—That is not the point. I know the letter says so—but the point is, when you see £18,000 worth of plant lying idle, I fail to understand why you did not say to Hepper : " Look here, that plant has got to get working " ; and I do not know how he could have met it except to say : " Certainly, come along, we will go up on Monday." He must have. He could not have defied you?

A.—It would not interest him. As a matter of fact, Mr. Halcrow will give evidence. He went out with me, and we went specially into the question of plant and we discussed it.

Q.—Then I will not bother you about it. As to machines which have been lying out in the sun and wet all this time, there is no market for them, I suppose?

A.—I do not know what condition they have been kept in.

Q.—Even so, what would you think you would get for £18,000 worth of shovels which have been lying idle for four to five years out in the open?

A.—I believe they have been kept in fairly good order as cranes.

Q.—You would not expect very much for them?

A.—No; Mr. Halcrow, when he comes, will be able to tell you how he went round and looked carefully at all the plant.

Q.—Did he see £21,000 worth of cement blocks, some of which had been lying there since 1923 for the storm water drains?

A.—I should think he did; but I would emphasise the point that I was not in control at all. I had no control at all. I had no power to order anyone to do anything.

Q.—But I cannot understand how you allowed yourself to remain in association with all these people whom you are condemning, and who, apparently, worked to some extent at times. I cannot understand how you remained as expert adviser to the Government of Bombay when all this sort of thing was going on year after year?

A.—Well, there is an old adage: " Never do what you know the enemy wants you to do."

Q.—When the " Kalu " was dodging in and out of Back Bay, by running in on the tide when she got enough water under her keel, and running out just before she grounded, were you ever aboard of her then?

A.—Never.

Q.—You have told us in your statement that your view is that it is possible that the Back Bay scheme can be carried to a successful conclusion. You say: " I emphatically assert that the Back Bay reclamation scheme inaugurated by Lord Lloyd is not a failure, and there is no reason why it should not be brought to a triumphant conclusion."?

A.—That is my personal opinion.

Chairman.—I think the people of Bombay would be happy even if it were brought to a conclusion that left them even money.

Mr. Billimoria.—That is quite right.

Chairman.—Your suggestion is this. I would rather like to follow it up. Would you like me to read the whole of paragraph 7 on page 116 of your statement?

A.—Please.

Q.—" Regarding the Back Bay scheme, the position at present is that the constructional words as designed have proved an unqualified success. Grave doubts were expressed in Bombay as to the possibility of building at reasonable cost a wall strong enough to resist the force of the sea, and I was brought out to Bombay one year especially to observe the force of the waves, but the sea wall, as built, has resisted successive monsoon storms, and will, when the works are completed, provide a handsome sea promenade. The filling in of the reclaimed area by the dredgers has certainly not come up to expectations. A great deal has been said about the quality and quantity of material in the harbour and the efficiency of the dredger, but very little consideration has been given to the human element in the working of the dredgers." I need not emphasise that, but you have said that is a matter that one has to beware of, and the point is whether it is not a matter that should have been brought to the attention of the Bombay Government. " My view is that there is an ample supply of suitable material in the harbour, and that the dredger can perform all that it was required to do under its contract and specification, but that the human element has failed completely, and under existing conditions I do not see how it can possibly do otherwise. My advice is to free the work from the incubus of Government control, get rid of the whole staff before next working season, and invite tenders from contractors for the completion of the entire work." I would like to elaborate that a little bit—" invite tenders from contractors for the completion of the entire work." Would you hand over to them the " Sir George Lloyd "?

A.—Yes; I would hand over the whole of the plant.

Q.—You would hand over the whole of the plant?

A.—Yes.

Q.—That is part of the offer?

A.—That is part of the offer.

Q.—When you say hand over the whole of the plant, that includes the quarry at Kandivli, and everything?

A.—Hand over everything.

Q.—Do you happen to know any contractor in the world who would be likely to make an offer that the Government of Bombay could consider?

A.—I have not taken tenders, and I have no idea.

Q.—There are several ways of looking at it. One view undoubtedly is that the people of Bombay do not want to spend another penny on this matter. Of course if they handed over the plant to a contractor, the contractor has to be paid for his work, because he has to go and finish the reclamation, does he not? That is what he offers for the money?

A.—Yes.

Q.—I do not know whether it is conceivable that there might be another method by which the contractor might stipulate to hand over to the Government of Bombay the 250 acres of works and roads and things of that sort, and be given in exchange 300 or 400 acres of reclamation?

A.—I quite agree. There are various ways of approaching the subject.

Q.—If a contractor would come forward and put a proposal which did not involve any extra expense by the people of Bombay, there might be some means of managing this matter?

A.—I am confident that one way or other it could be done. People are just as keen to speculate in land to-day as they were in 1865, on the knowledge that in the future the land will be worth money.

Q.—You are of opinion that the reclamation should be finished in its entirety?

A.—I am absolutely of that opinion. Might I draw your attention to page 117 where I speak about the Manchester Ship Canal?

Q.—I will read on. " Mr. Merritt, the Assistant Dredging Master of the dredger ' Sir George Lloyd,' in the course of his evidence summed up the situation admirably. When asked in what respects the dredging in Bombay differed from work done elsewhere he replied ' One is run by a private company and they want their pound of flesh; if you do not turn over the percentage you have to make room for someone else.' " I gather from an earlier passage in your statement that your view is that there was no driving force behind everybody there: is that right?

A.—That is absolutely correct.

Q.—" Lastly, there has been a disposition in Bombay to treat this large work (probably as large a dredging proposition as the world has seen) on a par with the building of a house or other cut and dried operation, and the moment anything went wrong there was condemnation of all sorts and an outcry to stop work." When you say " anything went wrong " do you put your case that nothing has gone wrong except that the dredging operations have given an output less than was expected?

A.—You can put it that way.

Q.—Is not that the way Mr. Cowasjee Jehangir put it?

A.—Yes, it is notorious that long before anything went wrong at all there was difficulty. What was the reason for the hurried revised estimate of Mr. Lewis which was wanted at 24 hours' notice—it was got out on account of political agitation. He says in his letter: " Owing to political outcry I am made to do this estimate in 24 hours."

Q.—We have not in fact got that letter. I see you refer to it. Have you a copy of it? I suppose you have the original?

A.—I have got the original.

Q.—I would rather like to see it. You say that even before anything went wrong there was hostility?

A.—I do, before anything went wrong at all in 1919.

Q.—Are you looking for the passage when you say every season that you went out Sir Lawless Hepper told you of the political and personal agitation which was being carried on?

A.—Yes.

Q.—I think you have made that statement here.

A.—What I was looking for was the statement that when I went out and was staying with Sir George Lloyd he told me—nothing had gone wrong with the works at that time—that there had been four resolutions tabled in the Legislative Council to deal with my firm in one way or other.

Mr. Billimoria.—I cannot understand why you attribute the failure to political agitation, because the revised estimate of Mr. Lewis was far nearer the mark than your estimate of 367 lakhs before the works had actually commenced.

A.—I do not quite follow that?

Chairman.—I do not think he attributes the failure of the work to anything political.

Mr. Billimoria.—He said if anything went wrong it was due to political agitation.

Chairman.—No; he said when anything went wrong, then a political agitation arose. It is not *if* anything went wrong—it is *when* anything went wrong. I see you are quite right, and in your statement you do say you were told that four resolutions had been tabled: " The moment anything went wrong there was condemnation of all sorts and an outcry to stop work. That, if I may say so, is a most narrow and parochial view. The work might be regarded for India as a national undertaking, and should be completed. In this particular case there have been overwhelming reasons connected with the state of the world for the original estimate being increased. All estimates for works were similarly increased, and it would be of interest to know what increase has taken place in the estimates for the building of New Delhi. But to take one example out of many of works carried out long before the war, the original estimate for the Manchester Ship Canal was in the neighbourhood of £5,000,000, whereas the actual cost was nearer £15,000,000. Now that the work is completed you hear no complaints from the City of Manchester—which is every day reaping the benefit of this great undertaking. I emphatically assert that the Back Bay reclamation scheme inaugurated by Lord Lloyd is not a failure, and there is no reason why it should not be brought to a triumphant conclusion. The slump in land values which at present obtains is not going to last for ever, and the day will yet come when Lord Lloyd's foresight and energy in the interest of Bombay will be recognised and gratefully appreciated." That is your view?

A.—That is my view.

Q.—I have concluded my examination, and I am much obliged to you.

A.—Thank you very much—I thank you for your great courtesy.

Sir M. Visvesvaraya.—I have been asking Sir Lawless Hepper in Bombay as to who was really responsible for the works. He said responsibility chiefly lay with the engineers. Then you have been telling us, both in your statement here and in your other statement, that you had no control over the works, and that you could not be responsible. I want to ask you a question about responsibility. On the 22nd July, 1922, you wrote: " We are the actual responsible engineers."

A.—Yes.

Q.—Then in the early reports on page 12 of the pamphlet: " The firm was at all times ready to assist and advise . . . in all matters relating to the execution of the works." That is in your report?

A.—Yes.

Q.—On the 3rd June, 1922, you stated: " We are the engineers responsible to the Government of Bombay and the Secretary of State."

A.—Yes.

Q.—On the 22nd June, 1921, in a letter to Mr. Lewis you say: " We are not only the engineers for the machinery, but for the execution of the entire work."

A.—Yes.

Q.—If these repeated statements have any meaning, do not they show you are really responsible for the execution of the entire work, and you have frequently insisted upon being so recognised?

A.—No; we were responsible for seeing that the permanent works were properly done. We had no responsibility or control whatever over the execution of the works.

Q.—But you are supposed to co-operate and help in the execution?

A.—We advise.

Q.—Do you not call that being responsible?

A.—We were advisers, and God knows we gave advice until we were tired of giving advice; but we had no control over the expenditure of the money. We had no control over the workmen or over the engineers; we were advisers without control.

Q.—Was that stipulated in your contract? What was the understanding in the contract?

A.—Whatever the contract was, we can only deal with the facts, and the contract, as you know, was modified: you are aware of that.

Q.—It was slightly modified; we accept the modification to that extent. You say: " The firm was at all times ready to assist and advise in all matters relating to the execution of the works." Again you say: " We are not only the engineers for the machinery but for the execution of the entire work." On page 57 of your statement which you have now put in you say: " I wish to make it clear that we never had any direct responsibility for the actual execution of the work."

A.—No; we did not have any direct responsibility.

Q.—You did not have any direct responsibility for the actual execution of the work?

A.—Not for the actual execution of the work. May I point out that these letters to Mr. Lewis were written to wake things up. We were getting no correspondence

at all. There were no reports. There was nothing happening. A veil dropped between us and Bombay.

Q.—You have said that. Whatever the reason for that may be, you intended, or did intend, that you should be responsible for the execution of the entire works?

A.—We never intended that we should be responsible for the execution of the works.

Q.—But you say : " We are not only the engineers for the machinery, but for the execution of the entire works."

A.—The execution of the entire works is the carrying out of building the retaining walls in accordance with our specification. We had nothing to do with the employing of coolies or the subletting of contracts to sub-contractors.

Q.—You said : " We are the engineers responsible to the Government of Bombay."

A.—We are responsible to the Government of Bombay.

Q.—Now you say in this statment : " I had no intention of being anything but an adviser."

A.—I had no intention of being anything but an adviser. When the Development Directorate was created Sir Lawless Hepper was not my servant. How could I be, with all deference, anything but an advising officer?

Q.—You objected to the words " consulting engineer," but if an engineer is appointed to carry on the work by the principal, in this case the Government, and if the principal appoints an executive officer to carry on the work in consultation with you, it is not necessary that you should have control over that officer, is it? In no contract is that necessarily made a condition.

A.—You cannot control anyone when another person pays him his wages.

Q.—That is true; but the engineers have to prepare detailed plans and estimates, and to advise on every difficulty that arises. Sometimes they measure the works and prepare the bills of costs. All that is done by the engineers; but you did not perform several of those duties.

A.—The resident engineer was supposed to perform all those duties.

Q.—He afterwards became the chief engineer?

A.—Yes.

Q.—You say he was not your servant?

A.—I think his position was unfortunate on account of dual control.

Q.—He said so the other day.

A.—On the subject of our control, there was an interesting question put by Mr. Billimoria to Mr. Lewis, and I think it would be interesting if I read it. He said to Mr. Lewis : "You have had wide experience of public works in India. In your experience do you know of any instance in which the engineers or the consulting engineers remained in England, and the work was carried on in India?—(A.) No. All work done with the Public Works Department is done inside the offices on the spot. The only case analogous to that was Delhi, where the architects were in London. (Q.) They were not engineers?—(A.) No; they were architects, and their position would be the same as engineers. (Q.) They prepared the designs and inspected the works?—(A.) But they had their offices on the spot. (Q.) And their representatives on the spot?—(A.) Yes. (Q.) Here they had no representatives?—(A.) No. (Q.) Unless he regarded you as his representative? You were not paid by him?—(A.) No; I was paid by the Government of Bombay. (Q.) So you know of no exactly similar case?—(A.) No." I notice that in Mr. Lewis' evidence, and I would like to explain this to Mr. Billimoria.

Q.—These questions were put by me.

A.—I am sorry : they appear in our transcript as having been put by Mr. Billimoria.

Chairman.—Perhaps you would explain now?

A.—Quite apart from the terms of our agreement, which specified that all the staff in India should be paid by Government, the case quoted of the architects at Delhi is not analogous, because the architects at Delhi are paid 5 per cent. I am not at all certain that it has not been increased to 7½ per cent.—on the cost of the works. We were paid 2 per cent. There are cases—in fact we are carrying out large works now—where we provide the whole of the staff; but naturally we get paid a corresponding figure. I just want to make that clear.

Sir M. Visvesvaraya.—That is a separate point. You should have insisted upon an increase in the percentage. You never raised that question?

A.—I never raised the question because it was not necessary. The Government had agreed to pay for the whole of the staff, and the Government had created the Development Directorate on purpose to carry out the work.

Q.—You say if you had had 5 per cent. or so you would have arranged for these things?

A.—Yes.

Q.—You have repeatedly insisted that you are responsible for the execution of the work?

A.—For the ordinary carrying out of our plans—not for the employment of labour.

Q.—By " execution " you mean the results?

A.—The " execution " means the building of permanent works.

Q.—You have some responsibility for the progress of that work?

A.—We cannot have any responsibility for the work because we could not tell what contracts would be let.

Q.—Did you not ask for information, and was any information refused by the resident engineer?

A.—Yes. There are cases on record where we asked and asked, and we got no replies to our letters.

Q.—If that is so, as the Chairman remarked, was not it your obvious duty to bring it to the notice of the Governor, or the Member of Government?

A.—We wrote officially to the Director of Development at once.

Q.—He is like yourself, a servant of the Government; but there are higher people.

A.—He was the head of the whole Development Directorate.

Q.—That may be; but your agreement was not with him, but with the Government of Bombay or the Secretary of State?

A.—He was the representative of the Government.

Q.—But he could not be held responsible in case anything went wrong on your side—in case they did not pay you, or did not carry out their contract. Your contract was with the Government of Bombay?

A.—Yes.

Q.—Have you at any time asked the Government of Bombay why in this respect facilities were not afforded to you so that you might be responsible for the execution of the work?

A.—I considered it was the duty of the Director of Development. I had no official communications with the Hon. Member—I had no official communication at all. I used to go and see him, but I consider that it was the duty of the Director of Development, if necessary, to draw the attention of his chief, the Hon. Member, to anything.

Q.—Could not you have addressed the Secretary to Government, who was also Secretary of the Development Department, who was accessible to you?

A.—I do not quite know who it was, or how it was.

Q.—He was bound to give you a reply to any question you addressed to him?

A.—He would simply have got the reply from Sir Lawless Hepper.

Q.—He was Secretary to Government.

A. It was rather confusing. He was Secretary to Government, and he was also Sir Lawless Hepper's deputy.

Q.—As Secretary to Government he did not take instructions from Sir Lawless Hepper. He went to a member of the Council. As Secretary to Government he was Secretary to the Member of Council of the Government.

A.—I know that Sir Lawless Hepper used to go to the Hon. Member twice a week.

Q.—He was head of the Department?

A.—Yes.

Q.—They had a separate secretary for the Department. All representations to the Government should be addressed to the Secretary to Government, and they did not go to Sir Lawless Hepper unless specially referred to him by Government.

A.—Yes.

Q.—Perhaps you did not bring the position clearly to the notice of the Government in order not to create trouble, and with a view to get on amicably with everybody concerned. May that be the reason?

A.—The case of Mr. Lewis was specifically brought to the notice of the Government.

Q.—In that case they did not act?

A.—In that case they did nothing.

Q.—Did you write to them: " The work is stopped because this man is in charge. Unless you remove him I cannot be responsible "? Did you make any such statement to the Government?

A.—Yes.

Q.—Could you kindly show us that?

A.—I spoke personally to the Governor of Bombay on the matter. It is in the evidence, you will remember that.

Chairman.—I remember it, but actually your answer to Sir M. Visvesvaraya's question should be No, because he said: " Did you write to the Government direct? "

A.—No; I did not write to the Government.

Q.—But you had an interview with Lord Lloyd at which you suggested that Lewis ought to be retired?

A.—Yes.

Sir M. Visvesvaraya.—Does it not look like a contradiction when you say in one statement: " We are not only engineers for the machinery, but for the execution of the entire work," as compared with when you say: " I never had any intention of being anything but an adviser." I am not criticising it, but I want an explanation. We want information on the matter.

A.—The position was this. When this veil dropped we were getting no letters at all from Bombay.

Q.—This was before the veil dropped. I am talking of the 22nd June, 1921. You said this: " We are not only engineers for the machinery, but for the execution of the entire works." The veil came later on.

A.—It was in process then. It was then that we noted a disposition to regard us as agents for the supply of plant, and not supply us with information that we wanted about the work.

Q.—You say: " We never had any direct responsibility for the actual execution of the work. I never had the intention of being anything but an adviser."

A.—I never had any intention of having the executive control. I never intended to have the executive control of the works.

Q.—You need not have executive control. but you may co-operate with a man. You may be part of an agency, like the Directorate of Development, to carry on the work. You are part of the machinery created to carry on the work.

A.—Yes; but we could do nothing but advise. We could not order. We could not have ordered Mr. Lewis to do anything.

Q.—If your advice was not taken could not you have taken steps to bring that to the notice of the Member of Government and say: " Now, they are not carrying out my instructions. How can I be held responsible under the terms of the contract? " Was not that the proper position to take up? I am only asking you for information, and I am not criticising you.

A.—I quite understand. It seems quite reasonable; but the fact remains that we did not go to the Government.

(Adjourned for a short time.)

Sir M. Visvesvaraya.—Have you considered the contradiction between those statements that I brought to your notice?

A.—Which were those?

Q.—That you were responsible for the execution of the entire work. You have said that again and again, and now you say that you had no intention of being anything but an adviser, and that you never had any direct responsibility. What is your final answer?

A.—My final answer is that we were responsible for the plans and for the permanent works, but we were not responsible for the execution, the way in which they were carried out departmentally.

Q.—Why did not you bring to the notice of the Bombay Government anything that you found unsatisfactory? The contract was with the Secretary of State. You might have brought it to the notice of the Bombay Government or of the Secretary of State. Will you kindly tell me how that matter can be explained?

A.—We had a discussion about responsibility with Sir Chimanlal Setalvad; otherwise I had nothing to say, except that I did not protest beyond Sir Lawless Hepper. I considered he was the responsible head.

Q.—If the Government say that at the time they depended upon you, and they considered you responsible for the work, would you say that they are not right?

A.—I would say that you cannot have responsibility without control. They created the Development Directorate.

Q.—The contract did not stipulate that you should have control?

A.—I look at it from the common-sense point of view. No one can have responsibility who has not got control. You cannot make anyone responsible who has not got control. That is a common-sense point of view.

Q.—Are there any duties connected with the co-operation that you have to render as regards the work? You have to co-operate with other officers. Under the Government there was the Development Directorate, yourself, and your firm?

A.—Yes.

Q.—You were both agents working in unison to do Government work. If the Government ask you: " Why have you not fulfilled your responsibility? " you then say

that the Government Director did not give you opportunities. You could have gone over his head?

A.—I should say that I did everything possible. I regarded the Director of Development as practically the final authority.

Q.—The contract does not say so. I do not think the contract even mentions that you have to work under the Director of Development, or anything of that kind?

A.—No, he was the head; that is my answer.

Q.—The dredger has failed to give the promised output. It has given less than half of what was promised. On whom do you place the responsibility for this? Who is responsible for the failure of the dredger?

A.—The Government of Bombay.

Q.—How can they be responsible when they entrusted the works to the engineers? You were the engineers, the responsible engineers?

A.—I had no responsibility for paying the workmen on the dredger.

Q.—No, but you ordered the dredger. You, the responsible engineers, advised about the dredger, and now when things have gone wrong you say: "I am not responsible"?

A.—No. Excuse me, I say that in my judgment there is nothing the matter with the dredger, and there is nothing the matter with the material. The dredger has never had a proper show, and if you were to let a contractor work the dredger you would have a very different result.

Q.—Did you make a statement that the dredger had been dredging for nearly three years, and had failed to give the required output? Why did you not make that statement when you saw that the dredger was not doing its job?

A.—I cannot remember the exact date when we made representations, but that is my considered opinion.

Q.—In a note dated the 16th of April, 1920, you have stated: "We, as the engineers, are therefore better acquainted to express an opinion," etc. You have stated that you were entirely responsible for the working of the dredger. Does not that responsibility mean that you were also responsible for the results?

A.—We cannot be responsible for results when we had no control over the working of the dredger.

Q.—You think that the dredger can do five million cubic yards per annum. Do you still hold that the dredger can give an output of five million cubic yards per annum?

A.—Of course, I cannot guarantee an exact figure of five million cubic yards. I say certainly that she can do enough to justify the guarantee. I would not like to express an opinion until we have had the dredger working under proper conditions.

Q.—Have you yourself stated subsequently that it should be considered satisfactory if it produces two-thirds of the output?

A.—Yes, but we are now of opinion that we can get ample satisfactory material to get the whole output.

Q.—To get the whole output?

A.—Yes.

Q.—Can you give me an instance of any dredger of this size which has given 5 million cubic yards in one year, working for only 170 days? I have been examining the working of other dredgers, and the relation of the yearly output to the hourly output has never been so large as you assume?

A.—I cannot give you any instance.

Q.—You cannot give me an instance?

A.—No.

Q.—So that it is a unique working of the plant?

A.—I cannot give you an instance because I have not looked up all the records. I simply say that I have not got the information.

Q.—You recollect that the Government of Bombay telegraphed to the Government of India, and the Government of India cabled the Secretary of State: "As consulting engineers this firm should be held responsible for the construction and design of the dredger as dual responsibility is most undesirable"?

A.—Yes.

Q.—Do you want to refer to that telegram?

A.—No, I think I can remember that.

Q.—You also stated that if the dredger did not do its best you would accept full responsibility?

A.—Yes, that was right.

Q.—Now that the dredger has not done its work do you accept responsibility?

A.—No. We say that we have never had anything to do with the working of the dredger. We repeat that if you take the dredger out of the incubus of Government control and give the men encouragement and encourage them in team work you will get far, far different results.

Q.—That has not been the opinion of many people whom we met in Bombay, the persons engaged on the dredgers. They said: "Of course the machine works all right, but we cannot be sure of the output, and we do not expect an output anything like that"

A.—You have got the evidence of the Dredging Master, Mr. Merritt.

Q.—He is the assistant dredging master. He may have made one sound remark in all his evidence. That does not mean that he understands the larger problems connected with the working of the dredgers. He is the assistant out there.

A.—Yes. He was asked why the results are different here to other places where he has worked, and he said that in other places they are out for their pound of flesh, and if you do not get the results you get the sack.

Q.—It was a very sound remark?

A.—But you cannot sack people in Government service; at least it is very difficult.

Q.—You ordered the dredger before the detailed plans and estimates were prepared?

A.—Yes.

Q.—You were very particular to have your own way in handling the whole of this dredger affair from the commencement. You have stated here in a memorandum in respect of dredgers in Bombay which you supplied to the Director General of Stores, dated the 16th April, 1920, "I replied I had already discussed this part of the project with the Governor of Bombay who, I understood, would be averse to any dual control in connection with this scheme, because if the dredger failed to do its work we, the Engineers, would naturally say that as we had nothing to do with the dredger we could not accept any responsibility." Therefore you insisted on being consulted at every stage in this dredger proposition?

A.—Yes, and we collaborated with Sir John Biles.

Q.—Then again in the last paragraph of the same note you say: "We, as the engineers, are therefore better acquainted than anyone else with the work to be done, and also being entirely responsible for the working of the dredgers should be permitted to express an opinion." You were permitted to express an opinion?

A.—Yes, we worked hand in hand with Sir John Biles.

Q.—You said, "being entirely responsible for the working of the dredgers." Do you now hold yourself responsible for the results?

A.—We claim that the dredger has never been properly worked.

Q.—Why did you not suggest that you should take it over and work it under your own control two or three years ago. You found in two or three months that she did not work well. Could not you have told the Government of Bombay: "The thing has been mishandled, will you allow me to handle it"?

A.—We do not do that. We do not handle dredgers.

Q.—Then you could have placed it in the hands of others in whom you had confidence. You took the responsibility deliberately at the beginning, and made no suggestion in the interval, and now when things go wrong how can you disclaim responsibility?

A.—Long ago I pointed out to the Government of Bombay that they could not get the best work in any department without giving some inducement to men. It is against the rules of Government, as you know very well, to pay any bonuses.

Q.—They could make an exception in such cases by order of Government, or, if necessary, by getting the permission of the Government of India, could they not?

A.—They found it very difficult. To give you one example, when I pointed out that there were no cost accounts of any kind being kept no one seemed to care a straw.

Q.—That is true. You are right in that.

A.—It took a whole year to get a reply to my letter.

Q.—That is true, and that is not your fault. That does not absolve you from responsibility for the working of the dredger. They say that you did not suggest anything to the Secretary of State. "The Engineer now says that he had some disagreement with one of our officers, and he did not bring that to our notice. How can we accept his disclaimer now." What answer have you to give to that?

A.—The answer I think is that just as we were really getting to grips the Government of Bombay in their discretion said that they did not want us any more. There had been only two seasons' dredging.

Q.—There have been three seasons now?

A.—Yes, there had only been two seasons then.

Q.—1924 and 1925?

A.—We sent out an engineer with great experience in 1925. He had great experience, and he could have given some very useful information. He will give evidence on the subject of the dredger but in all his visits all the information was wasted; nobody took any notice of it.

Q.—That is not the point. The Chief Engineer was your own nominee, and there was the Development Director who was co-operating with you; in these circumstances how can the Government accept that as a proper answer.

A.—Do you say we ought to have gone over the Director of Development?

Q.—Most certainly. This thing was going to ruin everything. When things were going adrift was it not necessary to go to the Gevernment?

A.—Perhaps we were wrong but we say that we looked upon the Director of Development as the mouthpiece of Government, the man who had access to the Honourable Member.

Q.—If the Government had not had these assurances from you they would probably have consulted other experts in order to be on the safe side, but they did not do it. They left everything to you, so far as the Government was concerned?

A.—They left everything to the Director of Development.

Q —That is quite true, and they thought that you were getting on quite well with them. No big work is ever carried out without minor differences. They thought the differences were of a minor character, and that you were watching the interests of the Government, according to the Agreement?

A.—I do not think they could have thought that, but that was the position, anyway.

Q.—You now say that you had no personal knowledge of the quality of the material, and that you relied upon a specific statement made by Mr. Kidd. I am not criticising; I want facts. In one place you say that you are better acquainted than anybody else with the work to be done, and then in another place you say that you have no personal knowledge of the quality of the material, but that you relied upon a specific statement made by Mr. Kidd?

A.—Yes, we were quite satisfied.

Q.—There is some contradiction about it.

A.—No, we were quite satisfied with Mr. Kidd.

Q.—You say: "We are better aquainted than anyone else with the work to be done;" you probably also included material?

A.—Yes, we were better aquainted. We knew what was wanted.

Q.—Anyhow, you agree that from a financial point of view the reclamation scheme is a failure so far?

A.—I would not like to say that it was failure. It would not have been a financial failure if there had not been this sudden slump in land prices.

Q.—That is one reason?

A.—Supposing that land prices had been what they were a few years ago, even on a 700 lakhs estimate they expected to make 326 lakhs profit.

Q.—That was the estimate?

A.—That was the estimate.

Q.—I admit that that is one of the reasons. I admit that land values fell very considerably, and that you are justified in putting that forward. Your original estimate for the scheme was 367·61 lakhs, and you described that estimate as reasonable and reliable?

A.—Yes.

Q.—You described it as reasonable and reliable; mark the words?

A.—Yes, reasonable and reliable.

Q.—Now within seventeen months you send up an estimate for 668 lakhs, and then the Government went over your head and sanctioned an estimate for 702 lakhs?

A.—Yes. 702 lakhs.

Q.—Now the Engineers have put forward an estimate which comes to 1,000 lakhs?

A.—Yes.

Q.—An estimate which you prepared for 367 lakhs has gone up to 1,000 lakhs. In February, 1922, it went up to 668 lakhs, which was your own figure, as against 367 lakhs. Is not that an enormous difference all in the course of seventeen months?

A.—I have nothing to add to the statement that I made this morning.

Q.—I put it from an Engineer's point of view?

A.—Yes.

Q.—I want you to give an explanation other than what you gave?

A.—I have really no explanation to make.

Q.—I want you to give an explanation why, within seventeen months, an estimate went from 367 lakhs to 668 lakhs? It is a very considerable increase, is it not?

A.—It is a very considerable increase. I think I pointed out that 136 lakhs of that ought to be deducted on account of the equipment of the lay out, with which we had nothing to do.

Mr. Billimoria.—It was included in the original estimate.

A.—Excuse me, no.

Q.—Roads, lights, and drains?

A.—That was not the equipment of the area.

Q.—Then what is the equipment?

A.—The equipment of the area is the provision of sewerage throughout the area.

Q.—*Sir M. Visvesvaraya.*—Sewers are all included?

A.—Sewers are all included in the 700 lakhs estimate.

Q.—Sewers, storm water drains, and everything is included?

A.—Yes.

Q.—They are all included in the 702 lakhs?

A.—In 1922 the expert town planner produced a plan showing how he was going to lay out the area. Before that, no one had the slightest idea what they were going to do. There were talks of putting a Government House there. There were talks of putting recreation parks. Then they got this expert, Mr. Davidge, and he laid out the area, but before he had laid out the area nobody knew what they were going to do with the ground at all.

Q.—It is not necessary that a lay-out should be of any standard. We may have to assume something. You have assumed figures in your estimate?

A.—We did not assume anything for that.

Q.—Excluding that item, you might have been more correct in the other items?

A.—It was always understood that the sewerage would be done with the Municipal Committee.

Q.—*Mr. Billimoria.*—Roads, drains, and lighting are 75 lakhs. What would these indicate?

A.—A few main roads.

Q.—*Sir M. Visvesvaraya.*—To what do you attribute this considerable increase in the cost in seventeen months?

A.—I attribute it very largely to world conditions.

Q.—Is it not due to the omission of many necessary items in the estimate?

A.—No. I say generally that it was world conditions. I have really nothing to add to the statement that I put in.

Q.—Was Sir George Lloyd keen on the scheme?

A.—Very keen indeed.

Q.—Would you say he was very keen?

A.—Yes.

Q.—Do you recollect having stated at any time that he would like to see the sea wall grow in a night?

A.—I do not remember having made that statement, that he would like to see it grow in a night. I remember once jocosely saying to Sir George Lloyd that he must not think he was like Aladdin with the wonderful lamp, that he could go and rub the lamp and look out of Government House window and see the wall growing.

Q.—You went to the Government of India accompanied by the Secretary to the Government of Bombay in order to get the Government of India to agree to your scheme?

A.—Yes.

Q.—Writing on previous occasions to the Government of India had not helped them to obtain their consent to any reclamation scheme?

A.—No.

Q.—The Secretary of State remarked at one time that he felt embarrassed by the insistence with which questions connected with the reclamation scheme were being addressed to him?

A.—Yes.

Q.—You also now admit that work was done without a reliable estimate?

A.—Without what?

Q.—Without a reliable estimate?

A.—An Engineer's estimate.

Q.—And then the dredger was ordered even before the estimate was sanctioned?

A.—Yes. As I have explained, that was because Sir George Lloyd was so very anxious to begin the work in October, 1920, and he made arrangements for the

Government of Bombay with a firm of Contractors in Bombay, the Indian Construction Company, I think they were called, to begin the work. I do not know what the details are, but they cancelled the Contract, and the work was delayed for a year.

Q.—You say that you also wanted an order for the dredger to be placed before the detailed plans and estimates were prepared and approved?

A.—Yes.

Q.—We have got it here in the same note to which I drew your attention?

A.—Yes.

Q.—" With reference to the preparation of the necessary plans and specifications, the usual custom among Engineers is to accept the Contract, and a general specification, thereafter requiring the builders to submit for approval all detailed plans and specifications, and presumably this will be done in the present case; " you advocated that?

A.—Yes.

Q.—No tenders were in writing on a comparative basis for the dredger?

A.—For the dredger prices were got out; it was not advertised, if that is what you mean.

Q.—That is what I mean?

A.—It was not advertised.

Q.—It was not a competitive basis?

A.—It was not advertised.

Q.—You considered the scheme as being one of the greatest of reclamation schemes?

A.—Yes, I suppose it is.

Q.—Are not all these instances of undue haste in starting the scheme on the part of the Government?

A.—I can hardly call them undue haste. You heard what Lord Lloyd said in his evidence. Once he had got the sanction, his great idea was to get something——

Q.—To push on?

A.—To get something to show as soon as possible.

Q.—I ask this question because you have said in your statement that there was no undue haste?

A.—It is a question of what undue haste means.

Q.—I am mentioning these incidents. Is it not because all these things were done in a hurry that the dredger has not given satisfactory results?

A.—No, I would not say that at all.

Q.—You would not say that?

A.—No.

Q.—There are some other instances that I want to bring to your notice. Did you give the details of the 367 lakhs scheme which you have brought to-day to the Chief Engineer on the works?

A.—No, why should he have them?

Q.—Because without such details how could he lay-out the works, and commence? Did you not give him some details as to how you arrived at this figure of 367 lakhs; otherwise, how was he to proceed with the work?

A.—No, that was an ordinary preliminary Engineer's estimate. Then the Chief Engineer was appointed, and then he started preparing his working estimates which were sanctioned from time to time by the Director.

Q.—By the Development Director?.

A.—For instance, he started working the Khandivli Quarries, and he sent in a working estimate to the Director of Development, and that went up to the Government and was sanctioned. Then he sent up another estimate. All the estimates were sanctioned piece-meal.

Q.—Then in 1922, they prepared the 702 lakhs estimate, and they sent you a copy, I suppose, after sanction?

A.—They sent me a copy, yes.

Q.—Did your contract require that you were to prepare promptly working drawings, specifications, schedules of quantities and rates, and estimates of cost?

A.—Yes.

Q.—To what extent have you performed this part of your obligations. What working drawings have you prepared? You state that they prepared the 702 lakhs estimate themselves. You protested, of course?

A.—Yes.

Q.—I see that from the correspondence, but had you any occasion to revise that estimate and ask the Government to modify it as incorrect?

A.—No.

Q.—You accepted that estimate?

A.—We were not asked to accept it; we were simply given it.

Q.—You did not bring to the notice of the Government that this was part of your duty to prepare plans and estimates, and that the Director of Development went over your head?

A.—We did prepare a large number of plans, estimates and specifications.

Q.—Can you mention some that you have prepared?

A.—Yes. We prepared a complete detailed set of plans and estimates for the 8,000 feet of the Colaba wall which was going to be let on a contract.

Q.—What else?

A.—We prepared the plans and specifications for the Marine Line section.

Q.—The wall and gantry?

A.—Yes, that is about all the permanent work.

Q.—After all, the sea wall is simply a solid wall. How long would it take you to prepare that?

A.—I would not like to say how long it took to prepare it at all.

Q.—You should have done the detailed plans and estimates for all sorts of work?

A.—You mean, for instance, that we should have prepared the plans for the Khandivli Quarry?

Q.—Yes.

A.—That is an example.

Q.—You should have prepared plans. Plans and estimates have been prepared by the Engineers on the spot and sent to you for scrutiny and remark?

A.—The preparation of all those plans was particularly excluded from our agreement by the Honourable Member Sir Chimanlal Setalvad under an auxiliary contract.

Q.—You want stone for the permanent works. The sea wall is a permanent work, and all the stone for it has to come from this quarry?

A.—No.

Q.—How can you construct a sea wall without stone? The stone has to come from this quarry? The main purpose of this particular quarry was to supply stone for the sea wall.

A.—Supposing the wall had been let by contract? We should have prepared the plans of the permanent works, but we should not have dictated to the contractor the way in which he had to get his stone; neither should we have prepared any plans for the quarry.

Q.—But it was not a contract work. It was Departmental work, and everything connected with the sea wall should have been taken into consideration if you were responsible for the wall?

A.—No, because it was specifically stated under our agreement that we were not to be responsible for any of these works.

Q.—Mr. Lewis said there was very little done by you in respect of detailed plans and estimates?

A.—As far as the permanent works were concerned, we did what was necessary.

Q.—But what were the permanent works? They were only one sea wall. It was only a cross section of the wall with a mound; that was all. That would not take an engineer of your eminence more than a week to do. It is not a very difficult work to design a sea wall. You have so many examples before you, and you can take 10 or 20 sections from various other places?

A.—You find very similar works where there is even less to do.

Q.—What are the necessary important plans and specifications? What we noticed, when we inspected the works and also the offices, was the absence of details. The plans and estimates were in a rough state. They had collected a number of figures and called them estimates. There was no specification, no description, no detailed measurements.

A.—For what?

Q.—For any of these works. We did not see any detailed plans in the way that they are usually done by engineers, or by the Public Works Department.

A.—That is a question for the Chief Engineer. He got all his estimates sanctioned. Every estimate he prepared was sanctioned by Government.

Q.—Might it not be due to the fact that you were not supplying them with sufficient details: although you were able to do it, you did not take much interest in the work?

A.—No, because it was not within our province to supply details.

Q.—Your contract is very clear on that point: " Ensure complete and satisfactory supervision of the works "?

A.—Would you kindly refer to the supplemental contract?

Chairman.—You will find it at page 60—Supplemental Agreement of the 4th January, 1923.

Sir M. Visvesvaraya.—" Messrs Meik & Buchanan are the engineers for the reclamation and connected works only, and not for roads, drains, lighting, and other things necessary for the development of the reclaimed area." The development is entirely excluded, " but the cost of so much of the storm water drainage system as has to be constructed during the progress of the reclamation is to be included in the amount on which the percentage for the purposes of the firm's remuneration is calculated. This recommendation applies also to the East Colaba reclamation." That is all you have said, is it not?

A.—Yes.

Q.—That does not exclude anything, except development work. After the whole reclamation is completed then the development work is taken up, and they ask you not to have anything to do with that.

Chairman.—Look at page 62.

Sir M. Visvesvaraya.—I understand that the sea wall had been to a large extent completed by the 4th January, 1923? This agreement began on the 4th January, 1923?

A.—Yes.

Q.—So until then the works were going on smoothly?

A.—We always went on those lines, and that was the result.

Q.—The whole thing centres on this point. The preparation of detailed plans and estimate did not entail much labour on your side. You have given an excellent report at the beginning which, as far as I can see, Government took as being very satisfactory, complete and reliable. After that you have not prepared any estimates or plans worth mentioning? Of course the sea wall may have been an exception. I do not want to criticise you; I just want to get the facts.

A.—If you come into my office I can show you large rolls of papers. We prepared all the specifications for the machinery.

Q.—I hope you will not mind my asking you unpleasant questions, but it is necessary to do so in this case. When you ask for quotations for a plant, do not two or three firms supply you with the specifications themselves, without your asking for them? Is not that the usual practice?

A.—Detailed specifications, yes.

Q.—You scrutinise them and pass them. That is what you do generally.

A.—Yes.

Q.—You state in your report of September, 1919: " I have gone into the matter very thoroughly, and I believe my figures to be reasonable and reliable," and so on. Did your regard your estimate of 1919 at that date as approximate?

A.—It was the usual reliable engineer's estimate

Q.—Can you point out in your report, or in the letters addressed by the Government of Bombay to the Government of India, anything which shows that you regarded the estimate as approximate at that time?

A.—It depends on what you call an approximate estimate.

Q.—You have stated that the usual practice is to prepare an approximate estimate, and get administrative sanction, and then put in hand the preparation of detailed plans and estimates?

A.—Yes. It was not a detailed estimate. It was not an estimate that you would go and put before a contractor and ask him to tender upon.

Sir Frederick Hopkinson.—You do not put estimates before a contractor and ask him to tender on them. You give him quantities, not estimates.

A.—I beg your pardon.

Sir M. Visvesvaraya.—You say: " Under the rules of the Government of India for the carrying out of Public Works, the approval of my report, plans and estimates did not imply more than the accordance of administrative sanction to the scheme, and a detailed project estimate giving the fullest particulars under each head and sub-head should have been submitted before any actual expenditure was incurred." I am not aware that the Government of India do such things in regard to a large estimate like this. When they know that it is only an approximate estimate they do not give administrative sanction usually, do they?

A.—Yes, I think they do.

Q.—I know something of the practice of the Government of India; many years ago I was associated with the Bombay Public Works Secretariat for some time. You say: " As time was of importance it was decided to proceed in antitcipation of sanction, and to prepare the detailed project estimate as soon as reliable data had been collected." If your reliable data had not been collected at the time you submitted your estimate,

how could you call that estimate reasonable and reliable? I am asking you for an explanation?

A.—It was a reasonable and reliable estimate, sufficient to get administrative sanction. The dictionary meaning of the word " estimate " does not imply anything binding, does it?

Q.—No. These were figures deduced from experience of other works. You knew the cost of other works and you deduced from that figures for the new project?

A.—The new estimates for the new Delhi are very different from the old estimates.

Sir M. Visvesvaraya.—Extensions are ofter suggested when a work is in progress; one set wants certain things done and another set wants additions.

Chairman.—And another may want less.

Sir M. Visvesvaraya.—What I ask you is, if you did not think your data were reliable, how could your estimate be so? I am using your own words.

A.—Reliable as an estimate.

Q.—If you thought the estimate was approximate, why did not you give orders for surveys and collection of information and data immediately after the project was started?

A.—That was done by the Development Directorate as soon as they took over the work.

Q.—But you did not even advise them to do that. Have you any statement on record to show that you advised them that detailed plans and specifications should be proceeded with after your scheme was sanctioned?

A.—It was done as a matter of course. I did not think it needed any advice.

Q.—As a responsible engineer, was it not part of your duty to remind them?

A.—It went on as a matter of course.

Q.—They took more than two years to prepare plans and estimates?

A.—But they were preparing, all the time, minor estimates and getting them sanctioned. They were getting sanctioned minor estimates every week.

Q.—Detailed estimates?

A.—Yes, for one item after the other.

Q.—Is it not very necessary, in the case of an important work like this, that some special staff should be employed, and all detailed plans and estimates worked up in three or four months' time? After all, although this reclamation scheme looks very big in money, it consists only of a wall and earth filling—two items. The dredger is a specialist's work, but you had only those two items to prepare estimates for. Why could not a detailed estimate be completed in about three months' time? In another place you mention that the preparation of the estimate would have taken a staff of engineers at least one year, and that it was decided to proceed in anticipation of sanction. Why should it take one year? Could not an engineer, with two or three assistants, have prepared it in about three months' time?

A.—I think you would have found that the staff would have taken about a year.

Q.—You prepared the section of the sea wall. The rest was all earth filling. It seems to be a very simple work. An architect for a building would require so many of these plans, but in this case there are no engineering difficulties of construction or design?

A.—They would have had to have got out all the details of the 700 lakh estimate. That would have taken about a year to do.

Q.—You think it would have taken a year to do it?

A.—I think so, yes.

Sir Frederick Hopkinson.—May I interrupt for a moment? How long would you give a contractor to make up an estimate for that work?

A.—I do not know at all.

Q.—Would it not be more like six weeks?

A.—Not if they are doing it as agents for the Government of India.

Q.—Supposing you had decided to ask for tenders for the work, how long would you have given the contractor to make up the estimate?

A.—I could not make any comparison between a contractor and a Government.

Q.—Supposing you had decided to do work by a contractor, and you asked a contractor to tender for it? You would ask him, say, on the 1st January. When would you tell him by when his tender would have to be in?

A.—I do not know.

Q.—Does not a contractor get about six weeks for a large tender?

A.—Six weeks to three months; but that is not Government doing it. Government would take a great deal longer.

Chairman.—The question was a contractor.

A.—A contractor would take six weeks to three months.

Q.—You must put forward many of these documents, both by advertising to the world at large, and individually to contractors. The question is whether you would not have required the tenders to be in about six weeks' time?

A.—Yes, certainly I should—six weeks to three months.

Sir M. Visvesvaraya.—Why, in this case, would it take a year, particularly as you are taking the risk of proceeding with the work on imperfect data?

A.—Because I think a Government Department, which works quite differently from a contractor, would have taken about a year.

Q.—I am afraid you have a very peculiar idea of Government Departments. It only means bringing a number of people together and asking them to fix a time?

A.—They have no incentive.

Sir M. Visvesvaraya.—But they have a sense of duty. They have to get into the favour of Government and to keep up their reputation. Is not that an incentive?

Sir Frederick Hopkinson.—The real point is that if you ask a man on 1st January to send a tender in on 1st December, he would say: "What month am I to base my prices on?" Prices may vary enormously.

Sir M. Visvesvaraya.—There are people, even in Bombay, who could give you an estimate for work of this kind in about two months' time. Now I come to a very important question. You know that the idea of a suction dredger was introduced for the first time about the year 1905?

A.—I accept that.

Q.—Before that they were thinking of reclaiming by dry filling?

A.—Yes.

Q.—When you prepared your estimate in 1919, did you consider what the alternative cost would be if dry filling were adopted?

A.—No. I never had any doubt as to what was the cheapest method.

Q.—Do you still think that?

A.—I do, and Mr. Kidd says the same in his evidence.

Sir M. Visvesvaraya.—I do not know; he cannot mean exactly what you mean.

Chairman.—He says that reclamation over a large extent is cheaper—he means by a suction dredger—than any other method.

Sir M. Visvesvaraya.—He had in his mind a different kind of dredger to what you have designed.

A.—That is a matter of his opinion.

Q.—There is a total quantity of 28 million cubic yards. What would you put the cost at for a cubic yard by dry filling?

A.—I have not gone into it.

Q.—We have had a cablegram recently from Bombay in which they say it is possible to do it for Rs.1, 8 annas. We consider it might be done for even less, but taking it at Rs. 1, 8 annas, for 28 million cubic yards, the cost would be 420 lakhs, would it not?

A.—Yes.

Q.—If the work is properly organised you may be able to do it for less than that. You have to add to that the sea wall, about 160 lakhs, making 580 lakhs. If the 367 lakhs estimate originally were a satisfactory estimate as compared with moorum filling, you could have done the work by earth filling for less than 702 lakhs?

A.—We never went into the question of dry filling.

Q.—Was not that a serious omission? Nobody would have sanctioned an estimate for 702 lakhs without giving consideration to this aspect of the question? When you prepare an estimate you have to show that your estimate, compared with all other alternative estimates, is the cheapest or most reasonable. If that had been done, Government would have found when they were faced with a 702 lakhs estimate that there was a cheaper method of construction than that designed by you. Is that not so?

A.—They did not do it, and they prepared the 702 lakh estimate.

Q.—But where does your expert advice come in, if you did not advise them that compared with a 702 lakhs estimate dry filling was cheaper? Do you not think that the alternative method should have been put forward to Government when you sent in your proposal?

A.—No. There never was any question about dry filling. Dry filling was always considered as outside the question.

Q.—Why outside? Until 1905 that was the only method of construction contemplated? Why should it be outside your purview or your consideration? Is it not desirable to prepare alternative estimates and select the one most economical and efficient?

A.—Well, it never was considered.

Q.—Turning to your terms of reference you say, " The specific point on which my opinion is required is the suitability of the proposed method of reclamation by means of dredging or alternative proposals for same." That is specifically mentioned on the first page of your report. Why did you not put forward other alternative proposals for the consideration of Government?

A.—I did not think there were any alternatives then.

Q.—There was nothing to think about if you had gone into the terms of reference put forward?

A.—Any estimates at that time would certainly have shown that the cost of dry filling was vastly in excess of wet filling

Q.—As an engineer, do you now recognise that earth filling was a cheaper method than dredging under present conditions? The dredger and the dredging would together cost 460 lakhs. The dredging plant is 162·48 lakhs; laying shore line pipe 1·76 lakhs and dredged filling 310 lakhs, according to the latest estimate. The whole thing comes to 470·47 lakhs, or 4¾ crores. Do you now recognise that dry filling would have been cheaper?

A.—No, I have no information about the price of dry filling.

Q.—It is a very simple problem

A.—How long would it take?

Q.—It would take much quicker than you could do it with the dredger. The dredger would do about 2 million cubic yards per annum, and they will be able to do twelve thousand cubic yards per day, which means about 4½ million cubic yards per annum. If that is so, would you agree that dry filling would be cheaper than the dredging which is now going on?

A.—I would not like to express an opinion. It would take a long time to think it over.

Q.—The figures are very clear.

A.—If you say you can do it cheaper, I accept what you say.

Q.—That is all I want. Several engineers, including Sir Alexander Gibb, Mr. Neilson and others, have said that if you have regard to the character of the material met with in the harbour it is not a dredging proposition at all. As a dredging proposition an estimate of 367 lakhs is quite alright, but when it comes to 702 lakhs, there is a cheaper method than dredging. Some people consider that this is a serious omission in estimating. They also say that you took no active steps to prepare a detailed estimate the moment the work was begun. It was left to chance. The work was begun and it dragged on, and in two years the detailed estimate was prepared. In the meantime work was going on and expenditure being incurred at the will of the subordinate officers which was all wrong.

A.—Estimates were being prepared.

Q.—You also said, in the case of Mr. Kidd's report, " It is usual when preparing estimates for a project of this magnitude, and especially when the estimates are those on which the authorities are asked to sanction the execution of the work, for all details to be furnished, but in this case details are left to imagination." In the case of your estimate also the details were left to the imagination.

A.—Mr. Kidd's was a working estimate and mine was an engineer's estimate. Mr. Kidd's was an estimate accompanied by ten sheets of working drawings, and it was an estimate sent up for final sanction.

Q.—That may be, but you led Government to infer that your estimate was reliable and reasonable, and you did not make any qualification such as you are now putting forward. In the statement you have furnished us with you have stated it is just an engineer's estimate, and you qualify it in a number of ways now; but you have never said a word in your report, nor did Government understand it so. Can you tell us why that is so? You now give an explanation in your statement here. In your report of the 11th February, 1922, to the Development Directorate you say, " Under the rules of the Government of India for the carrying out of public works the approval of my report, plans and estimates did not imply more than the accordance of administrative sanction to the scheme." What are the rules to which you refer? Can you point to any rules of that sort?

A.—No, I cannot.

Q.—There are no rules of that sort. They do not give administrative sanction so easily as you assume. The previous history of these same works shows that they have turned down scheme after scheme and have never sanctioned one, until you induced them to sanction one " and the detailed project estimate giving the fullest particulars under each head and sub-head should have been submitted before any actual expenditure was incurred." The actual expenditure was incurred in your case before any detailed project

was prepared. How, in the face of so many irregularities, do you think a work of this kind could succeed?

A.—I do not admit there were any irregularities.

Q.—Omissions I will put it. Were regular tenders called for the dredgers? If so, can you show us a copy of the notice issued by you?

A.—I have given you all the information I can.

Q.—Were the tenders compared and reported on?

A.—I have nothing to add to what I have already said on the subject.

Q.—Will you answer me yes or no—whichever you think proper. If you refer to some previous explanation, it will not help me. I want to be able to follow you. If you say, "I cannot give you an answer," do so.

A.—What is the question?

Q.—I want to know if you have a copy of the notice issued by you inviting the tenders?

A.—Yes.

Sir M. Visvesvaraya.—Will you kindly show it to me?

Chairman.—We have it. We have all the correspondence.

Sir Frederick Hopkinson.—You mean for the dredgers? They asked the dredger builders to come up to London to see the plans in the London Office and certain information was given to them.

Sir M. Visvesvaraya.—Can you give us a copy of the notice issued by you? You say it is available.

Sir Frederick Hopkinson.—We have it.

Sir M. Visvesvaraya.—Messrs. Lobnitz never got any notice.

Sir Frederick Hopkinson.—They were written to by Messrs. Meik & Buchanan in London, and were asked to come up to London to see the plans.

Sir M. Visvesvaraya.—But that is not a notice.

Chairman.—Sir George Buchanan and you are not quite at one about it. Sir George does not suggest—at least I am sure if he has suggested it he will withdraw it—that his firm ever sent a written notice giving details. What they in fact did was to write a letter saying, "We have been instructed to ask for one or two offers" (&c., reading letter down to the words "when we can explain the matter").

Sir M. Visvesvaraya.—I want to know whether the usual notice was sent inviting tenders. It was not published and issued it is true, but was it issued individually to each contractor?

A.—Yes.

Q.—Will you kindly show it to us?

A.—Notice was sent to each of the firms mentioned.

Chairman.—All the four firms had a letter to that effect—asking them to send a representative. We have three of them here, and I think Mr. McMurray told us he also got a letter.

Sir M. Visvesvaraya: In the case of Mr. McMurray you had had a long correspondence beforehand about the 367 lakh estimate, so it is quite all right so far as they are concerned; they knew all that you wanted. The other dredger builders, however, had no notice, and you asked them to come to your office, without giving them any particulars in writing?

A.—Each firm had sent them a large plan showing every possible particular of the ground and the dredging and everything wanted.

Q.—There is no mention of anything in the correspondence?

A.—I can show you the plan if you like.

Sir Frederick Hopkinson.—I should very much like to see it.

Sir M. Visvesvaraya.—I am sorry to ask you unpleasant questions, but why was it necessary to make a secret thing of it at all?

A.—Because we are not in the habit of disclosing the results of tenders we receive publicly. There is nothing to conceal.

Q.—The whole thing totalled together cost £500,000. Was not publicity necessary? It was Government business. Was not publicity necessary in regard to the conditions on which you invited tenders?

A.—It was the usual method, which we always adopt.

Q.—In your case you were acting for the Government. You were not doing it on your own account?

A.—We followed our usual procedure.

Q.—You did not compare the tenders and discuss them, and report to the Government your recommendation, with reasons for approving Messrs. Simon's tender?
A.—That was done by my office here when I was in India.

Q.—Was a proper memorandum prepared reviewing all the tenders, and stating why you particularly recommended Simons?
A.—Yes.

Q.—Could you kindly show it to us?
A.—I will see if I can find it.

Q.—We have a casual note about your recommending Messrs. Simons' tender for the dredger, and nothing more. It is on a quarter of a sheet of foolscap.
A.—Yes.

Q.—How could you have secured an efficient design without inviting competition? Simons are well-known builders, it is true; but why depend upon one firm only when other firms might put forward proposals and bring you their experience?
A.—We followed our usual procedure that we have adopted for years.

Q.—But this is an unusually big tender; an unusually big proposition.
A.—Well, we did what we always do. We do not advertise everything, and we were not in the habit of doing so.

Q.—Before you recommended one tender did you prepare a properly reasoned memorandum to submit to the Government for their sanction or information; or rather, was it not desirable that you should have prepared a memorandum and placed it before the Government?
A.—I think a complete memorandum was placed before the Government?

Q.—Have you a copy of it?
A.—No; I do not remember it. It is so long ago.

Q.—What we heard in Bombay was that you made a note on the margin of a document indicating your approval of Messrs. Simons' tender, and then the Bombay Government wrote to the Secretary of State and that was approved on your recommendation?
A.—Yes.

Q.—There was no memorandum or complete note dealing with the reasons which induced you to recommend Simons' tender.
A.—Well, there should be. There must be one somewhere.

Q.—If you did not send out full particulars and outline the proposals to the firms, how were they to know what was required? Do you think they will regard you to be serious about it?
A.—Yes; I think so.

Q.—Before you recommended Simons' tender you did not see the other tender of Lobnitz? They had merely telegraphed the cost?
A.—Yes, something of that kind.

Q.—They suggested two dredgers?
A.—Yes.

Q.—Was that sufficient information for you to come to a decision upon?
A.—It was ample information for me because the person in charge was my late partner, Mr. Charles Meik, one of the most capable engineers in Westminster. It was all done by him, and I had perfect confidence when I got the telegram as to what his opinion was.

Q.—You may have had perfect confidence yourself but should you not satisfy the public and the Government, according to the usual standards followed in such cases, when you invited tenders from a number of builders, namely, that they were all examined, costs compared, advantages and disadvantages weighed and efficiency discussed, before you made your recommendation? Nothing of that kind seems to have been done. You got information by cable, and one or two people declined to tender because the information supplied was slender. Then you made up your mind to give the tender to Messrs. Simons & Company.
A.—No, we took what we thought was the best.

Q.—The Chairman has already drawn your attention to paragraph 6 of your report, which runs thus: " The Government are well aware that economy in this class of work can be obtained only by securing that the suction dredgers and other plant required shall be of the best design. The difficulties which have arisen with the Port Trust dredgers serve as a warning on this point." You do not seem to have taken warning yourself?
A.—I have nothing to add to what I have already said.

Q.—I am only quoting your own statement.

A.—If I may say so, I cannot go on repeating myself. I have already explained fully my opinion on this matter, and I cannot say anything more.

Q.—You also admit that you advised the placing of the contract before the details were prepared here.

A.—I advised the placing of which contract? Do you mean before the details of the whole work were prepared?

Q.—You say that the first thing necessary is to place the contract and submit for approval all the details of the plans and specifications afterwards. You say that on page 2 of the note which you gave to the Director General of Stores. Coming to the question of soft clay and hard clay; you have already given an explanation in answer to the questions put by the Chairman. If a dredger could deal successfully with hard clay, it can also deal with soft clay, but not vice versa.

A.—I beg your pardon.

Q.—If a dredger could deal with hard clay, then it can also deal with soft clay?

A.—Yes.

Q.—But not vice versa?

A.—No, certainly it can deal with hard clay, only not in such great quantities.

Q.—You have used the words " hard clay " also in several places. You recognised the existence of hard clay?

A.—Yes.

Q.—But you have not used it in the dredger specification. What is the reason? I am sorry to ask you these questions, but I have to do it.

A.—The specification says soft clay.

Q.—But you have referred to hard clay in several parts of your report. In the 1919 report, and also in your early reports, you mention it in places, which shows you were aware there was hard clay.

A.—I have explained that fully in my evidence. The hard clay refers to the bottom layer.

Chairman.—That is not quite it. Your other explanation is that in speaking of hard clay you meant, not with reference to its position in the harbour, but with reference to it as a substance of reclamation?

A.—Yes; that is so.

Q.—I want you to be correct about it.

A.—Yes. I have said so much about clay that I do not want to repeat it.

Sir M. Visvesvaraya.—What puzzles me is this. You mentioned hard clay in your reports, and you do not bring it forward in the specification.

A.—I think I can only say in my judgment the dredger is correctly designed to work in soft clay.

Q.—You maintain that still?

A.—I maintain that absolutely.

Q.—You are opposed to the use of the term " hard " for the description of the material?

A.—I am.

Q.—Why have you used it yourself on page 9 of your report?

A.—I have explained I have used it in reference to the hardening out.

Q.—Then on page 12 in the printed compilation of correspondence you have stated this, and it is in your own name, not in the name of your firm : " I may say that we do not accept without more information Mr. Mitchell's pessimistic view of the nature of the material we shall get from the harbour, as we hope that there will be a great deal of hard clay which will require very little moorum backing." There you use the words " hard clay."

A.—Yes.

Q.—If hard clay was specified, then it would include soft clay, but not vice versa; so that you have precluded hard clay from the terms of the specification?

A.—I really cannot say anything more than I have said.

Q.—As regards the output of 5,000,000 cubic yards per annum, there are no guarantees from the dredger-builders, and we do not see any description of any other dredgers which have given that output. Did you think that your dredger would give the output that you have specified? What considerations made you think if you ordered the dredger on these lines you would get the output that you specified? Were you not particular about getting output at all?

A.—No.

Q.—You were anxious, or you were fairly sure, that the dredger would give the specified output?

A.—Yes.

Q.—You still think it could do that?

A.—Yes.

Q.—That is your position?

A.—Yes.

Q.—Very few people who have seen the dredger in Bombay agree with you.

A.—I am not surprised at that.

Q.—If hard clay is clay which would dry up hard, would soft clay dry soft? When it dries up will it be soft, and in that case will it be useful for reclamation purposes?

A.—Yes; but it would not dry soft, it would dry hard.

Q.—Soft clay would dry hard?

A.—Yes. Hard and soft are merely to be used in relativity. You can have soft steel.

Q.—That is true. The interpretation you have put is very unusual, I think, from a business point of view. I do not think many people would share with you that interpretation. Why did you not provide for a guarantee in the specification for testing the dredger at the site?

A.—I have never done such a thing in my life, and I do not know any place where it has ever been done.

Q.—If you did not do it in your life, ought not you to take a leaf from the lives of other people and inquire whether other engineers did it?

A.—They do not do it.

Q.—Then people take a very serious risk in entrusting work to you. Do you not take the experience of builders of other dredgers in all parts of the world before you design?

A.—I do not know of any place in the world where they have given a test at the place of delivery. I am not acquainted with any case in the world where a dredger has been sent 8,000 miles and the builders have given a guarantee at the place of delivery, except I am told there was some sort of guarantee for the "Jinga" and "Kalu." There may be cases, but personally I do not know a similar case.

Sir M. Visvesvaraya.—In the case of the "Kalu" there was a specific guarantee, and the dredger was supplied by the same builders.

Chairman.—It is agreed that both were to do either 78 or 80 hours trial, and by some magic both vessels did in fact do over 2,000 cubic yards per hour. After they passed out of the hands of Messrs. Simons they dropped down to 555 and the other figure of 1154.

A.—Exactly.

Chairman.—It is an average of 1126.

Sir Frederick Hopkinson.—The important thing is whether it is a maximum or average output; that is the whole point.

Sir M. Visvesvaraya.—You have to get an average of 2,000 cubic yards an hour to get your 5,000,000 cubic yards per annum?

A.—Yes.

Q.—This did nothing like the average.

A.—You have not started working yet.

Q.—Three years have elapsed. If it has not started working properly, why did not you call the attention of the Government to the delay?

A.—We could not call it three continuous years, but three dredging seasons.

Q.—You have declared that the whole thing should be completed in six years?

A.—Yes.

Q.—By now you ought to have got 15,000,000 cubic yards, but the dredger has not done more than 3,000,000 cubic yards.

A.—I have nothing to add to what I have said.

Q.—15,000,000 cubic yards is what you promised, and till now they have got 3,000,000 cubic yards?

A.—Yes.

Q.—You said for a little higher price it would be safer to get a dredger which would do this job on the site?

A.—I say this dredger will do its job.

Q.—Your mere estimate cannot be satisfactory. What is the guarantee? For three years you have been working it, with this unsatisfactory result. You are the technical adviser; why did not you take charge of it yourself?

A.—I do not handle dredgers.

Q.—Then why did you recommend it? You say you know all about dredgers in this statement. Your statement is very specific on that: " We are better acquainted than anyone else with the work to be done." Therefore if anything goes wrong with the dredger you have designed, you can go to the Simons' people or to the best experts and take their advice and prove that that dredger could do what was promised. The Government of Bombay would even now be prepared to give facilities if you can do it in three months' time. At all events I do not think they would object to such a proposal.

A.—If the Government likes to make a proposal I should be glad to consider it.

Q.—You would consider it?

A.—Yes. If the Government makes a proposal I should be very glad to consider it.

Q.—That is a specific statement, but you must not prolong the work. You must not require three or four years for trials?

A.—No.

Q.—Why did not you keep a representative of your own to watch your interests on the spot, and to keep you informed? The chief engineer was not giving you the information you wanted. As the engineers responsible for the work, why did not you have a man there to report to you and keep you informed of what was going on, so that you could take action according to the terms of your contract if they failed to do what you liked?

A.—We should very much indeed liked to have one there, but the Government of Bombay would not pay for him.

Q.—On the terms of your contract was not that included in the fee paid to you?

A.—No. Under the terms of my contract all the staff in Bombay were to be paid by the Government of Bombay.

Q.—But the expenses of your staff are your own concern?

A.—Yes.

Q.—Then should not you have kept a man there to enable you to carry out the terms of the contract?

A.—The Resident Engineer was supposed to be our representative.

Q.—He was the Chief Engineer?

A.—Yes, he held the dual office of Chief Engineer and Resident Engineer.

Q.—That did not work well?

A.—It was suggested we had better have an independent representative, and we said, " We should like it very much indeed, but you have got to pay him. It is no part of our guarantee to pay him."

Q.—Then about the guarantee at site: I understand that at Aberdeen there are dredgers which have been tested at site. You have no knowledge of that?

A.—I have no knowledge at all.

Q.—Were you aware that in the case of the " Kalu " and the " Jinga " the same firm had given a guarantee for a test at site?

A.—Yes, I understood they had.

Q.—Did you know it when you placed the order?

A.—I think I did, but I did not attach any importance to it.

Q.—Have you got your calculations for the capacity of the dredger, the horse-power to be specified, and all that? Have you got the details?

A.—Sir John Biles has that information; it is in the specification. The specification was drawn up by Sir John Biles.

Q.—Did you satisfy yourself that the horse-power designed was sufficient to enable the dredger to operate properly and give you the promised output?

A.—Yes.

Q.—What are the grounds on which you have come to that conclusion? Have you made any calculations, or have you had before your mind's eye examples of other dredgers which have given a similar output?

A.—I really could not answer that; I do not remember that.

Q.—It is a very big proposition, and you have taken the responsibility for it. Do you not think there must be some reasons in your mind before you recommend with so much confidence that the dredger would do its job?

A.—Well, I cannot say anything more.

Q.—You had the example at Bombay itself of a dredger on which guarantees had been obtained. You did not care to take that in account?
A.—No.

Q.—There were practically no tests under normal working conditions?
A.—Well, the tests were conducted by Sir John Biles.

Q.—When he was asked why the specification was in that particular form, and why guarantees were omitted, he said : " It is not my business, you must ask Sir George Buchanan.
A.—Yes.

Q.—Whom should the Government now hold responsible? The thing has gone wrong; that much is certain. Your present attitude is that you think you could put it right?
A.—I have no suggestion to make, except what I have already said : " Sack the lot."

Q.—You have specified for 5,000,000 cubic yards of output per annum, or something close to that. You should either give proper calculations to prove that or you should say that some other dredgers are doing similar work and this should do the same. Have you either of those methods of proving it?
A.—We went into the matter very carefully in the office. I have nothing more to say about it.

Q.—Then the Government had to take their chance by leaving this matter in your hands?
A.—Yes, they have to take the chance.

Q.—Then Mr. McMurray had stated that he was asked by you to agree to a guaranteed output at site, but he would not consent. Was he stating an untruth when he said that?
A.—No, he was not stating an untruth. I may have just mentioned the matter, but I never pressed it; it was not the sort of question I pressed.

Q.—You did not ask the other tenderers for similar guarantees?
A.—No.

Q.—Did you make any tests on the spot before you came to the conclusion that these specifications were the correct ones? Did you make any test on the spot in Bombay?
A.—No.

Q.—I suppose you made a calculation that the output would be 5,000,000 cubic yards per annum?
A.—Yes; that is what we asked for.

Q.—Having regard to the limited time available, 170 days, I understand you are going to give me to-morrow some instances of other dredgers which have given 2,000 cubic yards per hour?
A.—I have no information on the subject.

Q.—A dredger working for 170 days, which is likely to produce 5,000,000 cubic yards—is there anything near that in the case of any other dredger?
A.—It would take me months to look it up. I have no information on the matter.

Q.—Then must not the inference be that the design has been prepared without giving much thought to all these details, if you have not already got it?
A.—No.

Q.—If you can furnish that information within a few days I should be much obliged. It is difficult, I recognise, but you must have gone on some basis and some past experience, or on some calculation, before you decided that this dredger would do this amount of work : every engineer does that?
A.—We go to the maker, and ask the maker to produce a dredger to do a certain amount, and the maker produces it.

Q.—Then you did not get any guarantee from any particular maker?
A.—No.

Q.—If they had been asked to give a guarantee perhaps they would not have done it?
A.—No.

Q.—What is the good of specifying a capacity if no guarantee is taken for the efficient working of the dredger and if no penalties are enforced in the case of failure? In all contracts there is usually a penalty clause. This is one of the biggest propositions in the world. Should not these ordinary guarantees have been secured?
A.—No.

Q.—Sir John Biles stated he was entirely guided by you. He said the specifications were yours and you have accepted the entire responsibility in various statements. Who prepared the specifications for the dredger : was it the dredger builders?

A.—They prepared the detailed plans of the dredger.

Q.—That is the usual thing?

A.—Yes.

Q.—What part of it was provided by Sir John Biles?

A.—He revised the thing, he practically redrafted the whole specification.

Q.—On the materials supplied by him and by you?

A.—Yes.

Q.—Who is responsible for the output of the dredger at present—the people on the spot?

A.—The people on the spot.

Q.—When the dredger in the first year failed to give the promised output did you call upon the builders in the usual way : " Now why is not the dredger doing its job : what improvements are necessary? Will you put it right? If under the contract you are not bound to put it right you may charge a special fee for doing the work. Can you tell us what is wrong." Did you address a direct letter to that effect?

A.—It was nothing to do with the builders of the dredger; the dredger had been passed. It had passed the guarantees on the Clyde; it was no responsibility of the builders of the dredger.

Q.—If it did not give the output stipulated?

A.—If it does not come to its output.

Q.—But they have a moral responsibility, have they not? It is a huge business. They had accepted a specification for 5,000,000 cubic yards a year output. I suppose they meant to give a serviceable article when they undertook the contract?

A.—Yes.

Q.—Have they not a moral responsibility to put it right? They may charge a fee for it, but they are bound to do that, are they not? Who is responsible? You give the order and hand it over, and it is tested on the Clyde, and the dredger goes out there. You say you are not responsible, and Sir John Biles says : " I simply wrote down the specification on what was required, and handed it over to the builders." You say the builders are not responsible—then who is responsible? Somebody must be responsible. The Government trusted you and trusted Sir John Biles, that you would design and give them a serviceable dredger. But have they not a moral responsibility?

A.—I do not know about a moral responsibility.

Q.—If they disclaim responsibility, does it not show they have no confidence in the design?

A.—No.

Q.—I do not think the Government would refuse to pay a fee to put things right, or make some additional payment if necessary.

A.—Suppose the builders say there is nothing to be put right?

Chairman.—The dredger builders say so; they say : Our dredger will do exactly what it was promised to do.

A.—5,000,000 cubic yards.

Chairman.—In soft clay.

Sir Frederick Hopkinson.—They said at the rate of 2,000 cubic yards an hour.

Chairman.—Yes, in soft clay; and they say " That was the limit of our obligation, and we have done it. If you wanted something else you should have asked for it."

Sir M. Visvesvaraya.—Sir George has, in his description, stated that 5,000,000 cubic yards ought to be the output per annum.

Sir Frederick Hopkinson.—There is a great difference between 2,000 yards in one hour and an average of 2,000 yards through the whole season.

Sir M. Visvesvaraya.—I am asking the same question.

Sir Frederick Hopkinson.—The builders may floor you with a question of one hour's work, but all the calculations out there are based on 2,000 yards an hour average work for the whole season—which is a very different thing.

Sir M. Visvesvaraya.—Are not the persons working the dredger now supplied by the builders themselves?

A.—No.

Q.—Mr. Brims is a builders' man, is he not?

A.—No.

Q.—Mr. Speirs was a builders' man?
A.—Yes.

Chairman.—Mr. Speirs was nominated by the dredger-builders and approved by Sir George.

Sir M. Visvesvaraya.—I understand several of the subordinates were supplied?
A.—They may have worked for them.

Sir Frederick Hopkinson.—They may have worked for them, but they are not actually responsible for them.

Sir M. Visvesvaraya.—Would they be prepared to come forward and prove the working themselves?
A.—If they were paid for it, yes.

Chairman.—Wait a moment. Do you know that they would, or would not they sit on their contract and say: "We have done what we promised to do, and we have got paid for it"? Are you in a position to pledge Messrs. Simons that they will go out to Bombay and make that dredger do 2,000 cubic yards per hour in Bombay Harbour? They have steadily refused to do it, you know.
A.—I do not say they would pledge themselves to any guarantee, but I thought the question was: Would they go out and do something?

Q.—Had not you better leave them to give an answer to that? That is all I mean.
A.—Yes.

Q.—We do not want to create a wrong impression.
A.—Then I had better not answer.

Sir M. Visvesvaraya.—Why was no direct question of that nature put to the builders when the dredger failed to give the required output for two seasons? Why were they not called upon to make good?
A.—Excuse me. You have asked that question before, I think. We are going round and round.

Q.—You have not taken any action on the Government letter?
A.—No.

Q.—You did not call upon them to say why the dredger is not performing properly, according to specification?
A.—No; I have already answered that question.

Q.—I suggest a direct question should have been put by the engineers to the builders. You have already answered that question, you say; but I want to know what is the correct position. Should not the engineers have called upon the builders to explain why it is not giving the required output?
A.—No; I do not think it was any of their duty.

Q.—You now say that you can prove that it will do 5,000.000 cubic yards, but you were there the first season, and the second season, and I think, the third season; but nothing was done. You did not then say that you could put things right if the matter was left in your hands. Did you call upon the builders in a direct manner and say: "Your dredger is not giving the proper output"?
A.—No.

Q.—"Will you put on your own men and prove it, or words to that effect"—did you ask them that or not?
A.—No; with all deference, I have already answered these questions.

Q.—Did you advise the adoption of three shifts on the dredger?
A.—We always expected the dredger to work 24 hours a day. Those were Mr. Brims' instructions.

Q.—I thought your instructions were 15 pumping hours?
A.—That means working 24 hours a day.

Q.—15 hours is the average for pumping?
A.—Yes.

Q.—Your contract says that Sir George Buchanan shall devote the greater part of his time to this particular work. Could you kindly tell us the number of days you spent at Bombay on this work?
A.—I have put in a complete record of it.

Q.—I want to know how many days you spent in Bombay during each of the five years you were responsible for the work?

A.—I have already put in a statement to that effect.

Sir M. Visvesvaraya.—That does not give the number of days.

Mr. Ewbank.—No, it does not; but I can work them out.

Sir M. Visvesvaraya.—I wish you would do that.

Mr. Billimoria.—The witness said several months.

Sir M. Visvesvaraya.—The terms of the contract run thus: During the whole period of the execution of the works, the works shall be closely supervised, and Sir George Buchanan shall devote the greater part of his time to this particular work. Have you devoted the greater part of your time to this particular work?

A.—I suppose I have. I do not think I have ever been accused of doing anything else.

Q.—Then it says: " And shall remain in Bombay during such period during the working season as he or the Government of Bombay think necessary to ensure the complete satisfactory supervision of the works." We have already seen that in the way of detailed plans and estimates little was done. In this matter of devoting time, you spent only a few days in Bombay each season. Did you spend several months in the winter in Bombay, which was the understanding, according to your statement?

A.—No; in my agreement.

Q.—No; what you said to Mr. Montagu.

A.—Would you kindly look at the agreement? I go by the agreement.

Q.—The agreement is: " Shall devote the greater part of his time to this particular work, and shall be present in every year, and shall remain in Bombay during such period during the working season as he or the Government of Bombay think necessary to ensure the complete and satisfactory supervision of the work." Here is the statement you have made yourself: " I had agreed to go out and spend several months every winter in Bombay." How many months have you spent in those five years?

A.—I am prepared to go by the agreement.

Q.—The agreement is based on an understanding.

A.—That is not my agreement.

Q.—" The following is an extract from a memorandum of my interview with Mr. Montagu." When you wanted the contract to be entered into you promised that you proposed to spend several months every winter in Bombay?

A.—Yes.

Q.—You have not fulfilled that promise, have you?

A.—I can only repeat that I go by my agreement.

Q.—Then when you wanted the contract they gave it you on that understanding. You gave a promise on your own statement that you would spend several months in Bombay each winter, and you have not spent anything like that?

A.—I consider I have fulfilled absolutely my agreement. I have remained in Bombay every year as long as ever the Government required. I have never been asked to stay a day longer that I stayed.

Q.—That may be because they thought you did not take sufficient interest in the work, or you did not give them detailed plans and estimates. It may be due to that. The several months that you promised to be there you have not spent there.

A.—I do not agree.

Chairman.—We must make this quite clear. Your view of the agreement is that your obligation was not an obligation that it was necessary to stay for months. It was for you to stay there as long as you thought it was fit for you to do so, and also the Government of India should retain you as long as they wanted?

A.—That is correct.

Q.—When those conditions were fulfilled, that you had been there long enough to have supervised all the work, and when the local Government said: " Everything is all right," you were at liberty to go?

A.—Yes.

Q.—It might have been 170 days, or it might have been 20 days?

A.—Yes. If the Government had ever asked me to stay any longer I should have stayed. When the Government asked me on one occasion to go out specially in the monsoon I obeyed their orders.

Sir Frederick Hopkinson.—You must exclude the year 1925 from that. You could not have returned in the year 1925?

A.—No.

Sir M. Visvesvaraya.—In the contract or in the correspondence the work to be done in England is: "Correspondence with the Government of Bombay or any officer deputed to act on their behalf, including any reports from time to time required by the Government in respect of dredging plant or material, or progress of the works." Have you furnished any reports in respect of the dredger plant to the Government of Bombay. I suppose you take your stand on the point that you think the dredger can be made to work and give the output. What work had you to do in connection with the final inspection and supervision of the tests and trials of the dredger?

A.—I was in India.

Q.—You were in India then?

A.—Yes.

Q.—So the final tests were made without you?

A.—Yes; without me.

Q.—Did you make any tests yourself on its arrival in Bombay?

A.—No.

Q.—What was the work in connection with the design or specifications of the dredgers that you particularly did?

A.—I did not do any at all. It was Sir John Biles who did it all.

Q.—And the dredger-builders supplied the original specifications. You have got them printed in your report.

A.—They supplied those, yes.

Q.—Sir John Biles modified it, and then issued it to the dredger-builders?

A.—Yes.

Q.—What was your share of the work in that connection?

A.—After Sir John Biles had done that?

Q.—In connection with the whole design and specification of the dredgers.

A.—We supplied the general particulars.

Q.—You have not devoted the greater part of your time to this work?

A.—I beg your pardon.

Q.—You have not devoted the greater part of your time to this work?

A.—I should not like to say that at all. I should have to go very carefully into the matter.

Q.—The statement you have prepared of the number of days spent in each of the five years that you were responsible for the work would give us some idea of that. In 1920 you spent 33 days in Bombay; in 1921, 67 days; in 1922, 63 days; in 1923, 7 days; in 1924, 94 days; in 1925, 7 days.

A.—If it is there.

Chairman.—You ought to take out the separate visit during the monsoon.

Sir Frederick Hopkinson.—During the monsoon visit in July there was nothing going on.

Chairman.—That was in July, 1923.

Mr. Ewbank.—He arrived in Bombay on 13th July, 1923, and went to Baroda and came back to Bombay on the 30th July, and left Bombay for London on the 11th August. That only meant 14 days' difference.

Sir M. Visvesvaraya.—The total number of days is 288 spent in six years, including 1920. That is about 40 days a year. You have already explained why the sea wall was begun from both ends. Should not you have advised Government against the beginning of the sea wall from both ends?

A.—No.

Q.—As it would not have been economical to start from both ends should you not have advised the Government not to start that way?

A.—I have already stated that I did not advise the Government.

Q.—Can you tell me from the engineering point of view why it was that you were against the sealing of the foundations of the rubble mound?

A.—I have already explained that fully.

Q.—From an engineering point of view can you give it to me in a sentence?

A.—From an engineering point of view I did not think at that particular time it was necessary.

Q.—But they told you that the silt was escaping?

A.—Yes, in very insignificant quantities.

Q.—They have worked out that it would be 9 lakhs of cubic yards lost in two years.

A.—Yes.

Q.—That means that about 13 lakhs of rupees' worth of silt was lost?
A.—Yes.

Q.—Do you call that insignificant?
A.—No; certainly not.

Q.—Is not that loss due to your omission?
A.—I have already explained this fully in the evidence. I really cannot repeat every statement that I have made.

Q.—You need not repeat it. They drew your attention to the loss, and you did advise them of your own accord to seal the foundation; but when they suggested sealing you were opposed to that, and I suggest some explanation is necessary.
A.—With all deference, this was dealt with very fully, and is in the Shorthand Notes, and I really cannot go on repeating myself.

Sir M. Visvesvaraya.—Are you satisfied on that point, Mr. Chairman.

Chairman.—It is all here.

Sir Frederick Hopkinson.—There are one or two questions I shall ask him about it.

Chairman.—In the Shorthand Note we see that Sir George Buchanan did not think it advisable to seal it at that particular time, because, as he said, the passage to and fro of the sea would carry with it particles of the silt, and gradually the wall itself would seal up. Is that, putting it substantially, your point of view at that time?
A.—At that time.

Q.—That is how it is on the Shorthand Notes?
A.—Yes.

Sir M. Visvesvaraya.—The silt would come from the sea into the lagoon.

Chairman.—That a certain proportion of silt, probably not of any particular value as regards amount, would gradually seal up the wall of itself?
A.—From the engineering point of view I have described it fully, and it is in these Notes.

Sir M. Visvesvaraya.—In your statement.
A.—In the Shorthand Notes. I have already been examined on that very point at length.

Q.—But you were examined from a non-technical point of view, and I am asking you from a technical point of view. From an engineering point of view kindly give us why it was you were against the sealing of the rubble mound. If you do not want to say, say so.
A.—No; I do not mind in the slightest degree.

Chairman.—It is perhaps quicker to say it.
A.—What I said was that when my attention was called to it there was very little material going away at all. I said: "I do not think at the present moment it is necessary, although it may be necessary to do it later on," and I pointed out that there was a good deal going away through the hole in the wall, and then I went away from Bombay. If the people in charge of the work were so stupid as not to take action on their own initiative when they saw it being done, it is their responsibility.

Sir M. Visvesvaraya.—They say they sealed in spite of your disinclination to agree with them?
A.—I do not agree.

Q.—Anyhow, the 13 lakhs of rupees have been wasted.
A.—So they say, but I will not accept any figure.

Q.—You must accept some figures.
A.—No, I do not accept any figures at all.

Q.—It is a Government Department. The Chief Engineer is your own nominee. You cannot treat their figures in such an offhand manner.
A.—I accept them with great reluctance.

Q.—Why did you permit dredging in Back Bay against your better judgment? Why did you not protest against their undertaking that enterprise? It will eventually cost more than dry filling, will it not?
A.—It was not against my better judgment. I was shown borings showing that there was admirable material in Back Bay. If the borings were not properly taken, and proved to be absolutely untrustworthy, that is the business of the Chief Engineer.

Q.—Did you find out, before you approved of it, whether the dredger could pump into blocks 1 and 2? Did you calculate or make sure of that?
A.—That the "Kalu" would?

Q.—Would the "Kalu" pump beyond blocks 1 or 2? Would it be serviceable without capacity; or would you have to spend a lot of money equipping and starting the work, and then it would dredge a few million cubic yards and stop there?

A.—If the material had been suitable she would have done very good work.

Q.—You say it is due to the incorrect representation of the material?

A.—Yes.

Q.—I am sorry I have to ask some unpleasant questions, but what was the cause of your disagreement with Mr. Lewis?

A.—I had no disagreement with Mr. Lewis; his health broke down.

Q.—In the correspondence there has been some sparring, some disagreement; you must have noticed it?

A.—Yes. But if his health completely broke down——

Q.—He was irritable?

A.—I say his health broke down.

Sir Frederick Hopkinson.—We were told in the evidence that they were not on speaking terms.

Sir M. Visvesvaraya.—Is that true or not?

A.—That we were not on speaking terms—well, I would rather not speak about Mr Lewis. I say that his health completely broke down, and that his whole nature, moral, physical and mental, underwent a change owing to his disease.

Q.—It is very good of you to say that. Why was it that the dredger was ordered and brought there so early, involving idle time charges? I hope you will not say you have already given the reply, as I want it from an engineering point of view.

A.—As a matter of fact I have already given the reply, but the reason was that Sir George Lloyd expected to get the wall started in October 1920. In that case we hoped to have enough done by the end of 1921 for the dredger to work; but as the wall did not start until October 1921, every thing was out a year.

Q.—Even without the wall could not you have started pumping by temporary bunds?

A.—No.

Q.—There is plenty of space in the exposed area in block 7?

A.—No; we could not have done it.

Q.—Could not you have put a wall of moorum and pumped into it? They are all shallow—probably about 2 yards deep.

A.—Well, if the Chief Engineer could have done it he probably would have done it, but he did not think it possible.

Q.—You subsequently made the statement that there was no hurry for the plant: "There is no tearing hurry for the plant."

A.—No; there was no hurry when the wall was not started.

Q.—You can construct a wall of about 1,000 feet and then put in a cross wall, and go on filling at once. That could have been done even from 1922, could it not?

A.—If we could have done it we certainly should have done it. It was not done.

Q.—It was not done, but it might have been done?

A.—No; I cannot say it might have been done.

Q.—The interest charges are about £67,000 to £70,000. A wall of about 10 feet would have secured an area for pumping into in blocks 7 and 8?

A.—Well, it was not taken into consideration.

Q.—Were you submitting programmes of operations to the Government from season to season, and insisting upon their working to them?

A.—We advised them as far as we could. It was not a case for insistence, because we had no power to insist.

Q.—You had promised the Government to ensure a complete and satisfactory supervision of the works?

A.—Yes.

Q.—In order to do your share of the work could not you have insisted upon these things being observed?

A.—Insisted upon what?

Q.—Upon no time being lost, and the dredger being used immediately on arrival: to have prepared in good time for the commencement of the dredging, and to have had a programme of operations, and to insist upon the work being done according to that programme, on an understanding with the officers of the Development Directorate?

A.—Well, there was no case of insisting: it was not possible to insist.

Q.—Were you submitting a progress report of the work from half-year to half-year, that is, comparing the quantities, rates, and amount as estimated, with the quantities and amounts as actually executed, side by side?

A.—Do you mean in money?

Q.—In money and quantities?

A.—No; we never knew what the work was costing. We do not know what the work is costing now.

Q.—Could you not have insisted upon receiving that information?

A.—If the Government of India will not take any action what can you do?

Q.—The Government of Bombay?

A.—The Government of India.

Q.—What have the Government of India to do with it?

A.—I pointed out that they were not keeping any costs, and I had not the faintest idea of what the work was costing, and nobody knew what the work was costing.

Q.—You said that.

A.—That is detailing the action which happened. I wrote to the Director of Development, or rather I pointed it out in my report to the Director of Development, and the Secretary to the Government wrote to the Government of Bombay, the Honourable Member, and then it went to the Secretary to the Government of India in the Finance Department. Eight months later, I think it was, the Government of India in the Finance Department wrote and said: "What is all this about; we do not quite understand it." Then I arrived in Bombay.

Q.—After a year had elapsed they began to take some action. They had taken some action, but it is not satisfactory yet.

A.—Obviously, I could not know what the work was costing.

Sir Frederick Hopkinson.—Is not it frequently the case in Government offices that these things go on and on, and the only thing which stops them is that one of them gets lost?

A.—Yes.

Sir M. Visvesvaraya.—How are the Government and the public and yourself to know how the work stood?

A.—We did not.

Q.—Then why did not you tell the Government of Bombay in an official letter: "I will not be able to fulfil the terms of the contract entered into with you unless you provide for the ordinary procedure practised in engineering works"?

A.—Well, I had already told them in half a dozen different ways.

Q.—But those were all addressed to your Chief Engineer?

A.—As I have explained in this case I went up to the Government of India and no action was taken. If you cannot get anything out of the Government of India it is not much good addressing letters to the Government of Bombay.

Q.—But you did not address the Government of India direct?

A.—No.

Q.—Your recommendations went to the Government of India for practical action?

A.—Yes.

Q.—They took some action afterwards. Probably if you had insisted upon further development they would have carried out your wishes on the costing, but it was not insisted upon, or they thought it was an ordinary thing and left it there. Might not that be the case?

A.—I do not think so. I think you take an optimistic view of what my powers of insistence were in Bombay.

Q.—If I may venture to make a suggestion, they thought that you wanted to take your duties lightly, and so it was no use troubling about these matters. That is what I gather from the correspondence.

A.—I do not think that is so.

Q.—Taking the omission of the programme, the omission of the preparation of progress reports showing quantities and rates and amounts, they would say: "These are serious omissions, their preparation was usually the duties of the Engineers."

A.—Yes, they are usually the duties of the Engineers.

Q.—You stated that the Public Works Department had no reclamation experience. It is not everybody that has reclamation experience; but what sort of reclamation experience is to be expected if the designs are prepared by an expert and there is the ordinary enginering work to be carried out? There are no special difficulties of engineering or construction in this case.

A.—Did I say particularly reclamation experience?

Q.—I think so. You said the local Public Works Department officials had no reclamation experience, in your report?

A.—I think I said marine work.

Chairman.—You can take it as marine works.

Sir M. Visvesvaraya.—What is it that you wanted them to know? What did you mean by that reference to lack of experience of the Public Works Department officials?

A.—Well, the construction of marine works like the construction of a marine wall in a heavy sea.

Q.—You know that the Bombay sea wall was being constructed by engineers in Bombay Presidency?

A.—Yes.

Q.—You know that previously the Port Trust Chairmanship and offices had been held by Government engineers?

A.—I know that.

Q.—There are several local engineers there?

A.—I make no reflection whatever on the officers of the Public Works Department.

Q.—You gave that as a reason for appointing people from outside; that is the reason why I am asking you questions.

A.—As a matter of fact, Mr. Lewis was a Public Works man.

Q.—Did the officers whom you appointed as Resident Engineers possess technical experience of this kind?

A.—Yes.

Q.—When a Consulting Engineer like you has prepared the design, the details are all matters of ordinary engineering practice?

A.—Yes.

Q.—The expert advice was all supplied by you?

A.—Yes.

Q.—You think the Public Works Department officers were not competent to carry on the work, and so you wanted special officers appointed from outside?

A.—We did appoint Public Works officers.

Q.—One or two; but the regular Public Works Department was tabooed. You said you did not want them. You have stated that in your statement and in your original report.

A.—I have nothing to add to that. I quite agree that the Public Works Department engineers would have been suitable. We got one.

Q.—Have you any objection to the Public Works Department supervising that work?

A.—I have not the slightest objection to the Public Works Department.

Q.—*Except that it is slow?*

A.—*I have no objection to the Public Works personnel, but I think that the procedure of the Public Works Department is capable of a great deal of improvement.*

Q.—You have stated in some place that the new Department had not the experience of the Public Works Department—it was lacking in experience.

A.—I have said that, and I have said that I thought the creation of the Development Directorate was a mistake, and that the Development Directorate degenerated into an ordinary Government Department, slavishly following the other Departments, held down by rules and regulations and restrictions just as if the Public Works Department had been carrying it out. It was on exactly the lines that are adopted by the Public Works Department, and it was subject to the same rules and regulations, but without its experience.

Q.—Did the officers nominated by you possess such experience? Could you name them?

A.—The only officers nominated by me were Mr. Lewis, Mr. Elgee, who certainly had had a great deal of experience of sea work, and Mr. O'Rorke.

Chairman.—Was not there Mr. Brims?

A.—Yes.

Sir Frederick Hopkinson.—And Mr. Thomas?

A.—No; I had nothing to do with Mr. Thomas.

Sir M. Visvesvaraya.—He was appointed from here.

A.—A large number of applications were invited, and he was chosen. Mr. Thomas was a local man appointed in Bombay.

Q.—Who prepared the indents for home purchases?

A.—The indents for home purchases were sent home.

Q.—What was the procedure followed in the case of those indents?

A.—The procedure followed was that the indents were sent to my office, and my office took any tenders. The tenders were sent to the High Commissioner—I think it was the High Commissioner—and we recommended the tender and the High Commissioner accepted our recommendation or not as he thought fit, and he placed the order and we inspected the goods.

Q.—And despatched them?

A.—No; we did not despatch them. They were despatched by the Director-General of Stores.

Q.—Final approval lay with the Director-General of Stores, I take it?

A.—Yes.

Q.—And the indent was submitted by the chief engineer direct to you?

A.—Through the Director of Development.

Q.—With his approval, I take it?

A.—I take it, it was certainly with his approval.

Q.—And the final tender or estimates were not approved by the Development Directorate, but by the Director-General of Stores?

A.—Yes.

Q.—Did any Government officer make any changes in tenders recommended by you, in your whole experience?

A.—I cannot remember at all. I think it is unlikely.

Q.—Were you ever consulted about the indents for local purchases in India?

A.—Never.

Q.—That is a matter on which you were never consulted?

A.—No; I never knew what had been purchased.

Sir M. Visvesvaraya.—When you went to Bombay, what are the points you went over with the engineers? Did you not take stock of the whole position?

Chairman.—As you are coming to a new subject perhaps it would be convenient to break off.

Sir H. Courthope-Munroe.—Before we break off may I just clear up this point? I understand it is agreed now that we should have the Shorthand Notes?

Chairman.—Certainly.

Sir H. Courthope-Munroe.—May we have that document returned?

Chairman.—You may remember that you anticipated that we might be taking weeks over this.

Sir H. Courthope-Munroe.—I did not.

Chairman.—I can assure you it will take less than five minutes. We hand it back to you, but it is an example of the value of producing the document.

Sir H. Courthope-Munroe.—Thank you.

Sir Frederick Hopkinson.—I assume we shall see it to-morrow. I shall have one or two questions to ask.

Sir H. Courthope-Munroe.—I am perfectly willing anything should be got, but these being original documents we did not want to part with them.

Chairman.—They show exactly how the matter was made up.

Sir H. Courthope-Munroe.—Sir George has been in attendance here since Thursday. He is a busy man, whose time is money. He has represented to me (he hoped to finish to-day), that to-morrow will be the very last day he can undertake to be present personally. We have the other witnesses; but to-morrow, as far as Sir George is concerned, I understand it, must be his final attendance here.

Chairman.—We will consider that this time to-morrow.

Sir H. Courthope-Munroe.—You understand the position as he conceives it? He is being paid no fees whatever. He is coming here to assist the Committee to make its report, and he is giving full and frank information.

Chairman.—It is a little broader than that.

Sir H. Courthope-Munroe.—I venture to think that is the effect of it.

Chairman.—It is a little broader than that.

(*Adjourned to to-morrow at* 11 *o'clock.*)

The Committee Assembled at 11 a.m. on the 2nd November, 1926, all the Members being present.

The examination of Sir George Buchanan was continued.

Sir H. Courthope-Munroe.—Since the meeting last night, Sir, Sir George Buchanan has turned up a letter which he wrote to H.E. Sir George Lloyd, the Governor of Bombay, making a complaint, and, in view of your questions about why Sir George did not make complaints, it might be as well that you should have the letter handed in to you, and for Sir George to refer to it. (*The letter was handed to the Chairman.*)

Chairman.—The letter is dated the 31st July, 1922, and is written from Victoria Street by Sir George: " I began a letter to Your Excellency some time ago, but decided, as Sir Lawless Hepper was on his way home, to wait until I had seen him, as I know you have quite sufficient worries without my adding to them. At our last meeting in Bombay I told Your Excellency that there seemed to be some misapprehension as to our position. Mr. Lewis appeared to be regarded as the Chief Engineer in fact as well as in name, and that at the meeting of the Advisory Committee I was not even introduced to the members. After my return home we were very much concerned at the absolute cessation of all letters and reports from Mr. Lewis, and on the 3rd June, 1922, I wrote a strong letter of remonstrance, and sent a copy to Sir Lawless Hepper. Since then, and I think principally because Mr. Lewis has gone on leave, the veil has been lifted, and we are getting our reports by nearly every mail. Sir Lawless Hepper called here on the 26th, and I showed him a letter, of which I enclose a copy, the original having been despatched. The letter speaks for itself, the gist of it being we should like to do our job according to our reading of the agreement. Mr. Lewis, either through ill-health or a misconception of our position, has been keeping us in the dark and treating us as consultants. Sir Lawless Hepper takes our view, and the matter will have to be cleared up if and when Mr. Lewis returns to duty." Then there is a matter about South Africa. " I have written this letter because I know how very interested Your Excellency is in everything connected with the Back Bay Scheme, and would like to hear of any difficulties direct from me." That is dated 31st July, 1922. The letter speaks of an enclosure, Sir George?*

A.—Yes, I think that is among your documents.

Q.—May we just identify it. It should be round about July, 1922, if we have it?

A.—I can give you a copy of it.

Q.—It will not take you a minute to tell us if I hand you my copy of the documents. *There* is the 9th June (*handing document to Witness*). Your letter is the 31st July. Will you just pass through those letters from the 9th June?

A.—No, you have not got those letters.

Q.—Will you let us have a copy of it?

A.—I will.

Q.—Would you like to have this back?

A.—The original is with Sir George Lloyd.

Q.—Have you another copy?

A.—I am not quite certain.

Q.—I think perhaps the best plan is that you should give us a copy, and retain that. Is there anyone whom you could send down to get a copy of the letter enclosed, or will you give us the substance of it?

A.—I will try to get it for you after lunch.

Chairman.—Thank you very much. Will you now proceed to put your further questions, Sir M. Visvesvaraya?

Sir M. Visvesvaraya.—Did you get any reply to, or acknowledgment of that letter from Sir George Lloyd?

A.—No; but what happened was, that when I did get to Bombay I had a long interview with Sir Chimanlal Setalvad in Sir Lawless Hepper's presence. All the real action that was taken, however, was that Mr. Lewis's letters were directed to be sent through the Director of Development instead of to me direct; otherwise, the main issue was evaded. It is not evidence, but I remember that Sir Lawless Hepper told me that he was not pleased with me for addressing a letter direct to the Government.

Q.—In reference to my question of yesterday, have you worked out any figures of your own showing the time you spent in Bombay?

A.—I do not quite understand you.

Q.—What time did you spend in Bombay?

A.—You have all the particulars.

*See Appendix XIII.

Q.—But have you worked out independently any figures showing how many months you spent in Bombay? You remember I put the question yesterday?

A.—I have given the figures to this Committee.

Q.—You have given a general statement?

A.—No, I gave a detailed statement.

Q.—But in that statement you included work which you did outside Bombay. Cannot you give us the actual net time which you spent on the Bombay work? However, we have got some figures. Do you consider that you have devoted the greater part of your time to the work as stipulated in the contract?

A.—I consider I have done everything within the contract.

Q.—If Sir Lawless Hepper complains that you were in Australia or in other places, that is not a reasonable complaint?

A.—He never has complained.

Q.—In your own statement you mention that he has complained and that you have answered his allegation.

A.—He never made any complaint of me.

Q.—Sometimes you were in Australia and sometimes elsewhere?

A.—I was not a whole-time officer of the Government.

Chairman.—In his statement Sir George Buchanan said that before he went to Australia he had an interview with Sir George Lloyd——

A.—No, with the present Governor, Sir Leslie Wilson.

Q.—Yes, with the member in charge, and with Sir Lawless Hepper, and they discussed Australia and knew perfectly well he was going, and did not ask him to stay or suggest that his presence was necessary. That is how Sir George has dealt with the matter.

Sir M. Visvesvaraya.—You have not got a list of the plans and specifications which you sent out from London for the permanent works?

A.—No, I have not.*

Q.—Yesterday you stated that you would be prepared to show that the dredger would be a success if the staff was completely changed according to your wishes?

A.—Yes.

Q.—Do you expect to be able to do the work at the estimated cost of 5 annas, or even 8 annas?

A.—I could not say, because I am not now associated with the work.

Q.—But you said it would be possible to work the dredger according to the estimates?

A.—I cannot guarantee anything now, as I am no longer in touch with the work.

Q.—But you feel assured that the dredger is capable of doing its output?

A.—I have said that several times.

Q.—Do you expect to be able to do the work if the whole plant is placed under your direction, and you are allowed to deal with the staff as you think best? Do you think you will be able to do it at any specific rate, and do you expect to be able to pump material into the middle blocks?

A.—That is a hypothetical question, because I have nothing to do with the work at present.

Q.—You have nothing to do with the work now, but you had something to do with it originally, when you had charge of it. You stated yesterday that if you were given a free hand, you would do the work?

A.—Yes, but I have never been given a free hand.

Q.—If you were given a free hand now, would you be able to prove that the dredger could give the promised output?

A.—I should have a very good try.

Q.—That is all?

A.—I should have a very good try. I cannot bind myself down.

Q.—Then you have modified your statement. Yesterday you said that, if you had an opportunity, you would prove that it was a success.

A.—I would prove it was a success.

Q.—Now you say you would " try " to prove it?

A.—I have never been asked. I cannot go and guarantee what would happen if I was given complete control. That is a hypothetical question.

Q.—Nobody else says that the dredger is capable of doing the work which you have promised about it. I asked you yesterday whether you could prove it if you had your own way and staff. Now you say you would " try " to prove it?

A.—No; I say it could be done, but the occasion has never arisen.

---

* See Appendix XIV.

Q.—" It could be done." You do not undertake to *prove* it could be done?

A.—I have never been asked. I am not going here to give any undertaking I have not been asked.

Q.—But if you were asked, you would do so?

A.—If I were asked I should consider the matter.

Q.—Then the statement you made yesterday, that you could prove that it would give the proper output, is not to be accepted as a final statement? You stated that yesterday.

A.—I do not quite follow.

Q.—You stated yesterday that, if you were given an opportunity, you would prove that the dredger complied with all the conditions under which it was purchased?

A.—Yes.

Q.—To-day you say, " I will try." Will you kindly give me a definite answer, and I will close my question?

A.—Will you put it to me, Mr. Chairman?

Chairman.—Sir M. Visvesvaraya says that yesterday you asserted that you could prove that the dredger would do her guaranteed output. Sir M. Visvesvaraya is of opinion that, this morning, you are rather going back on that and qualifying it by saying you would merely try; but, as I understand your evidence, from first to last you have always asserted that the dredger could do the work for which she was designed?

A.—Yes.

Q.—Namely, to dredge 2,000 cubic yards per hour of soft clay?

A.—Yes.

Q.—And you say, " Given proper team work, proper coal and proper incentive, and a dredging master with driving power," you believe you would get that result, or so nearly that result that nobody would quarrel with it?

A.—That is it.

Chairman.—That is how I understand it.

Sir M. Visvesvaraya.—At that rate?

Chairman.—Yes, at the rate of 2,000 cubic yards per hour of soft clay.

Sir M. Visvesvaraya.—And five million cubic yards per annum?

Chairman.—Yes, or so near that nobody would quarrel with it.

Sir M. Visvesvaraya.—Do you expect that the dredger would pump into the middle blocks also? You have, in all, eight blocks. One dredger is pumping now into blocks 8 and 7. Do you expect that the other blocks could be filled also from the same dredger?

A.—I am sorry; but I cannot go into these questions.

Q.—Is it because they are difficult?

A.—No.

Q.—You have designed dredgers and pipe-lines, and I ask you whether you would make sure that the middle blocks could be pumped into, and you now hesitate to give an answer?

A.—Yes, the middle blocks could be pumped into.

Q.—At the rate of 2,000 cubic yards per hour?

A.—I really cannot go into these details.

Q.—This must be the A B C of your work?

A.—I really cannot go into all these details of the execution of the works.

Sir M. Visvesvaraya.—As long as that is noted——

Chairman.—Is it a question of distance?

Sir M. Visvesvaraya.—Yes.

Chairman.—Would you put the distance to him? Have you the distance measured off?

Sir Frederick Hopkinson.—I will deal with this point.

Sir M. Visvesvaraya.—Of course, we recognise that pumping could be done if no regard is paid to the cost, but the main point is whether the work could be done at the estimated rate or at any reasonable rate, and whether the dredger could pump into all the blocks comprising the reclamation area. Now with regard to the tenders for the sea wall. The tenders are not in the usual form in which they are usually sent out to contractors, are they? Your tender form required the contractors to do much of the work which the engineers are expected to do themselves. For instance, you ask the contractors to submit in detail their proposals for carrying out the work. Is it not usual for the engineer himself to do that part of the work—the detailed proposals for carrying out the work?

A.—If you will excuse me, Mr. Chairman, this is a matter of our practice and procedure, and I am not prepared to enter into a discussion as to whether we were right or wrong in the professional practice which we adopted.

Sir M. Visvesvaraya.—This is an engineering question.

Chairman.—You can say in answer to it, Sir George, " That was our practice. It may be a good practice or a bad practice, but it is one which we have pursued for a number of years."

A.—That is our practice.

Chairman.—Put your question again, Sir M. Visvesvaraya.

Sir M. Visvesvaraya.—You want the contractors to specify all the plant they would require to carry out the work and the cost thereof; you want them to give a list of the staff and their salaries and office expenses; you want them to state the amount of percentage over and above the estimated cost they would require to carry out and maintain the work; furthermore you want the contractor's account books showing all discounts, rebates, commissions, and similar allowances; you also want the accounts and vouchers to be handed over to Government on completion of the work. I am only asking whether those conditions were not unusual?

A.—No.

Q.—Can you mention any big works in regard to which such conditions were observed? I may be wrong; I may be ignorant of them.

A.—I suppose you can get a number of examples, but I am not in a position——

Q.—Will you give me one example after lunch?

A.—No. I personally am not going to go into that matter. That is the practice we adopted, and we stand by it.

Q.—Is it only your firm which adopt that practice, or is it generally adopted by all firms?

A.—I will not say anything about it. We thought that was the best way to do the work.

Q.—All I want to know is whether those proposals should have been put forward by the engineers, and whether they are part of the engineers' responsibilities? If you say No, I will have your opinion recorded; that is all. I have a few questions to ask you about your statement. On page 29, paragraph 35, you say, " He would give me his entire and absolute confidence "—that is the Governor—" and if I said the scheme was impracticable he would turn it down at once and start on something fresh, but once my opinion was given he would refuse to allow any other expert to report, and he asked me not to let him down." Do you not find it an advantage in your practice to consult other experts, and take into account the experience of other works in your practice?

A.—I do not see how this arises out of this letter.

Q.— . . . " he would refuse to allow any other expert to report." That is his concern and not yours?

A.—Yes. That is a question which ought to be addressed to Lord Lloyd.

Q.—Now I want to put a question to you on paragraph 41, page 36, where you say, " Mine was the usual report prepared for a client prior to the preparation of working drawings and specifications." In the case of Mr. Kidd's scheme, it was expressly understood that the detailed project would be submitted and the work would be allowed to be proceeded with; but your scheme was allowed to be interpreted as a complete and reliable scheme. I only ask you to give me an answer, Yes or No?

A.—Mine was a report upon Mr. Kidd's scheme.

Q.—That is true, but you stated that yours was a reliable estimate, and Government understood it as such. Is there anything anywhere in the reports of the Government, or in your own report, to show that your estimate was an approximate figure?

A.—It was an estimate.

Q.—You state subsequently that it was an approximate estimate, but at the time you did not say so. It is expressly stated in the report of the Government of Bombay in regard to Mr. Kidd's scheme, but not so in the case of yours.

A.—Yes.

Q.—That is the point?

A.—Yes.

Q.—I only want information.

A.—Yes. Well, it was an estimate.

Q.—It was not understood at the time that it was an approximate estimate?

A.—Excuse me. What is the meaning of the word " estimate "?

Q.—What is the meaning of the word " estimate " in your mind? What is a " reliable estimate," and what is an " approximate one "?

A.—I should like you to look at the dictionary meaning of the word " estimate."

Q.—" Reliable estimate " and " approximate estimate " are two kinds of estimates?

A.—What does " estimate " mean?

Q.—An estimate is the value of the work derived from experience on similar works.
A.—Yes.

Q.—If that is so, was yours a reliable estimate or an approximate estimate? Reliable and approximate are not one and the same thing. If it is reliable it is not approximate; if it is approximate, then it is not reliable; you have to prepare another estimate?

A.—I should like you to read the meaning of the word " estimate " in the Oxford Dictionary.

Q.—Very well, I will drop that question. On page 39, paragraph 49, your statement reads: " I understood my firm would be in sole charge and control and that our Resident Engineer would be free from numerous restrictions on the economical execution of work which obtains in India on works carried out by Government." An engineer advises the principal about the conduct of the work, but he is not in sole charge and control, is he? Why should you not have regarded the Development Directorate as the contractor for all practical purposes, and adapted your duties accordingly?

A.—The Development Directorate was in the position of contractor?

Q.—They incurred the expenditure; they carried out the work, and of course the Development Director could overrule you. He combined in himself the duties of the contractor and the supervising authority. If he overruled you, could you not have gone to the principals then—the Government?

A.—Yes.

Q.—The engineers cannot be given the sole charge and control of any work. They are advisers. They can prepare and put out a programme. They are technical advisers, and as such, if their advice is followed by Government their responsibility ceases?

A.—Yes.

Q.—But you did not carry out the Engineers' duties, you say, because they did not respond. The Development Directorate did not respond, and you did not insist upon the Development Director doing his share of the contract?

A.—I had no power to insist that the Development Director should do so.

Q.—You could have represented it to Government?

A.—I think I have represented it to Government.

Q.—Specifically? You have allowed yourself to fall into an indifferent position with reference to the work, have you not?

A.—No, I should not say so.

Q.—You have not been definitely carrying out your duties, simply because another official of Government obstructed you. Your statement amounts to that, does it not?

A.—I cannot go beyond what I have put in my statement.

Q.—On page 44 you say, speaking about Messrs. Simons & Co.'s tender, " I was not far out when I told you that if the order was not placed before the 12th March, it would cost your Government another £100,000 ". When they put up the price in that way, why did you not ask other firms of dredger builders to tender again?

A.—By that time it was in the hands of Sir John Biles, and the Stores Department.

Q.—It may have been, but when they raised the price, would it not have been well to have advised them to call for tenders, even at that late stage?

A.—But I did not know. That is a question you should address to the Director-General of Stores. I did not know what the price was until the contract had been let. I had nothing whatever to do with the letting of the contract.

Q.—The prices were discussed by you before you gave the advice?

A.—They were discussed. Really, I have nothing to add to what is in this statement.

Q.—Again, on the same page you say, " I understood you would be adverse to dual control in connection with the scheme because if the dredger did not do its work, we should turn round and say that as we had had nothing to do with the dredger, we could accept no responsibility."

A.—I have dealt with that in my previous evidence.

Q.—On page 55, paragraph 69, you say " To represent and assist the engineers there is appointed a resident engineer and staff of assistants, who are under the direct orders of the engineers. Their salaries are paid, in some cases, by the engineers and in others by their clients, depending upon the terms of the agreement, but there is no dual control and the duty of the resident engineer is to carry out the engineer's orders, to see that the work is executed in accordance with plans and specifications, and to measure up the work done from time to time in order that the engineers may issue certificates for payment of the contractors."

A.—Yes.

Q.—" The resident engineer also sends the engineers progress reports, progress plans and sections and corresponds regularly with the engineers." Did you help in measuring up the work? "

A.—How do you mean " measuring up the work? "

Q.—Checking the work done on the works? Was not the work measured up and checked by any of your representatives?

A.—Our representative was the resident engineer.

Q.—Did you check the work independently?

A.—No.

Q.—The resident engineer was the Development Directorate's agent?

A.—Yes.

Q.—He was also your agent?

A.—He was also our representative.

Q.—Did you check the work of the resident engineer?

A.—Why should I? He was the man to do the work. If I got someone to check him——

Q.—There must be somebody to check the work of the man on the spot?

A.—There is a limit to checking.

Q.—Do not the engineers measure up the work from time to time and keep a record of the progress of the work?

A.—The resident engineer does.

Q.—But are not the engineers also responsible?

A.—No. As a rule the resident engineer is the engineer's servant.

Q.—He may be the servant, but are not the engineers themselves responsible for watching the progress of the work, the quantity rates and the amounts of expenditure?

A.—If you mean, do we ever personally go and measure up the work, we do not. We have our representatives.

Q.—You have some officer or representative of your own to measure up the work so as to give your principal a report as to the exact quantity?

A.—Yes, and that is our resident engineer. Our resident engineer in this case was Mr. Lewis.

Q.—Then did you accept his measurements as final and correct?

A.—I do not think he ever made any measurements.

Q.—If he did not take any measurements, should you not have insisted on his taking the measurements and keeping the accounts up to date? You did once?

A.—It is on the records.

Q.—But a general report, or a remark like that, did not relieve you of the responsibility of insisting on all the regular duties of the resident engineer being duly performed?

A.—We could not do any more than we did do. We wrote to the Governor of Bombay, and we made a fuss about the cost accounts.*

Sir M. Visvesvaraya.—I think those are very sound remarks which you made about the cost accounts. I must admit that.

Sir Frederick Hopkinson.—But we have not seen any cost accounts.

Sir M. Visvesvaraya.—On page 63, paragraph 80, you say, " We agreed to perform the work for 2 per cent., and we have only been paid 1½ per cent." Have you any objection to stating the total payment received up till now?

A.—I have not the faintest idea. If you were to take the net payment, expenses in our office, income tax, and one thing and another, you would be surprised how small it was.

Sir Frederick Hopkinson.—I think that applies to all of us, Sir George.

Sir M. Visvesvaraya.—At page 67, you state in the first paragraph, " We consider any revised estimates at this stage quite impracticable. In six months partial, and in two years complete, revised estimates possible." Why did you regard the preparation of revised estimates as impracticable?

A.—It was our opinion at the time. That was our opinion, the way the works were going.

Q.—It was not that you thought that it could not be done in a reasonable time?

A.—It could have been done by other people. It could not have been done by these people.

---

* See Appendix XIX.

Q.—You state lower down, " We received, in reply to our cablegram, a letter from the chief engineer dated 19th August, 1921, saying that the estimates were required for political purposes, and were given by him on the understanding that they were not binding, and he had also stipulated that they should not be published." Is that the 702 estimate to which you refer?

A.—No. That was an estimate prepared for political purposes.

Sir M. Visvesvaraya.—What was the amount of that estimate?

Chairman.—It must be the estimate on which Lord Lloyd based his speech on the 9th August, 1921.

Sir M. Visvesvaraya.—702 lakhs?

Chairman.—Roughly 7 crores. Curiously enough, it was 702 lakhs. The date was the 9th August, 1921. That was the date of the speech made by Lord Lloyd.

Sir M. Visvesvaraya.—At the top of page 69 you say, " We do not propose to give any more detail in the revised estimate than in the original one." May I ask why you did not propose to give any more detail?

A.—We proposed to make our revised estimate on the same basis as the one in the book.

Q.—How could it be a reliable estimate unless it were detailed, with specifications, plans, and estimates? Unless these were all given, how could it be a reliable estimate? You meant to have the 702 lakhs estimate on the same basis as the 367 lakhs one?

A.—The chief engineer was working out his detailed estimates, which were being approved one by one by the Director of Development.

Q.—But there should be some check of the details also, should there not, or do you not think it necessary?

A.—I had nothing to do with the checking of the details. It was not within my province.

Q.—But the preparation of estimates is your job?

A.—It was not within my province.

Q.—The preparation and approval of the estimates is the work of the engineers, is it not?

A.—We are getting back to what we were discussing yesterday.

Q.—Just say yes or no?

A.—Estimates, yes.

Q.—And you say you did not want to give any more detail. Why did you not want to give any more detail?

A.—I am referring, and I suppose you are referring, to such works as the Khandivli Quarry and all the temporary works in connection with the scheme.

Q.—They come in the cost?

A.—Those are details.

Q.—You do not think you should go into them?

A.—It was not within our province. That is done by the Chief Engineer and Director of Development.

Q.—They are one of the acknowledged duties of the responsible engineers, are they not?

A.—No. I think we argued that at length yesterday.

Sir M. Visvesvaraya.—If you do not want to go into it I will leave it.

Chairman.—Sir George does not say he does does not want to go into it. What he says is : " I think I have already covered it in my previous answer."

Sir M. Visvesvaraya.—I want a direct answer on the statement he has made here. He says: " We do not propose to give any more details in the revised estimate." In the original estimate there were no details. He says in the revised estimate he did not want to give any details. (To the witness) : Why was that? Just make a statement, and I will accept anything you say.

A.—I am very sorry, but I do not follow the question.

Q.—You say you did not want to give any details in the revised estimate. May I ask why?

A.—Because the details did not concern us.

Q.—Without your going into details, how can you be sure of your estimate being correct and complete? Even at this time did you want to give an approximate estimate, or did you want to give a proper and correct estimate?

A.—We wanted to give a correct estimate.

Q.—How could you do it without going into details? Without giving details your estimate would not be complete?

A.—I do not think I can follow the question.

Chairman.—The point which I think Sir M. Visvesvaraya is trying to make is this. He says, why did you not go into details? The answer may be that you must yourself have gone into details, but you were giving a skeleton result?

A.—That is correct, yes.

Chairman.—If your details were all right you were merely giving the skeleton result.

Sir M. Visvesvaraya.—But the engineers not only have to give a skeleton result but the details also. In order that the estimate should be complete both the details as well as the skeleton should be given. Will you say yes or no?

A.—I say that is the custom in the Public Works Department in India.

Q.—But not for the engineers?

A.—No.

Q.—They do not give details?

A.—No.

Q.—If modifications are made in the course of the execution without reference to the details and the cost goes up, who will be responsible? How are they to know whether the contractor is going on in accordance with the original work or not unless you have the details?

A.—There again I cannot answer these questions, Mr. Chairman. I am very sorry; possibly I am very stupid.

Q.—No, no, you have your own difficulties; I can see that. On page 81 you say "A costing system would only be of use to the Executive, and of no use to the Audit Office, and he suggested that the present audit system remain unaltered, but that a system be introduced which would be of the greatest use to the Deputy Chief Engineers in charge as it would be of a technical nature and would enable the Deputy Chief Engineers to watch expenditure over each process and to effect economy." I for one entirely agree with all those remarks. It is a pity that the costing system has not been introduced on the work. The only additional remark I might make is that the engineers might have insisted on the costing system being adopted.

A.—I beg your pardon. Who do you mean by the engineers?

Q.—Yourselves.

A.—That we might have insisted?

Q.—Insisted upon the costing system being adopted.

A.—I would like to draw attention to that, because I pointed out very fully that we had no powers to insist on the Government of Bombay taking action.

Q.—You had no power to insist, but you could have made definite representations warning the Government that if they did not do it things would go wrong?

A.—I do not think there could have been anything more definite than the representations which were made.

Chairman.—You mean round about page 78 of your statement?

A.—Yes.

Sir M. Visvesvaraya.—As your agreement was with the Secretary of State and not with the Development Director, your disagreement with the latter did not release you from the responsibility of the terms of the contract you have entered with the former.

A.—One moment. In the case of the accounts my protest went as far as the Government of India and the Finance Department.

Q.—Not in writing. You sent a private note. You did not address an official letter to the Secretary. If you had you would have been entitled to an answer?

A.—I really cannot follow that. I had no power to address official letters to the Secretary.

Q.—I beg your pardon. The other party is the Government, not the Development Director.

A.—What more action could have been taken.

Q.—An official letter could have been written saying "Your Development Director is not observing the terms of the contract strictly, and I cannot be responsible if these things are not done."

A.—In addition to putting this all in my annual official report?

Q.—Yes. Ought not you to have done that?

A.—In addition to putting this all in my annual official report, which was for the use of Government, I should also have written a special letter to Government?

Q.—Yes. That is the usual practice. In reports you may say all sorts of things, which the Government may accept or deny, but on any specific point you could have addressed a specific letter to the Government of Bombay?

A.—I wish to put it on record that in my judgment we could not possibly have done anything more than we did in the matter.

Q.—At page 88 you speak of " The degree of disorganisation reached was discussed between us whenever we met, and latterly, as has been shown, all correspondence with the Chief Engineer passed through Sir Lawless Hepper's hands. As a consequence of Mr. Lewis' illness, the lack of a business like system in the Bombay office, and an atmosphere of hostility more easily felt than describable by a visitor from London, the work was an unhappy one for all concerned." All I mean is that a definite letter to Government might have helped matters. I will leave it there.

A.—It was about that time that a definite letter was written by me to the Governor of Bombay.

Chairman.—And the matter, Sir George, is referred to in the greatest detail, and with great insistence, in the report of the 11th February, 1922, page 9, paragraphs 33 and 34. You brought the thing as fairly as you could to the attention of the Government in your official report. You discuss the whole method?

A.—Yes.

Sir H. Courthorpe-Munroe.—What page are you referring to, Sir?

Chairman.—The report of the 11th February, 1922, page 9, paragraphs 33 and 34, which set out exactly his views and contrast the practice in England and the practice which obtains in India, and where he expresses a very definite opinion about the whole matter.

Sir M. Visvesvaraya.—That is true; that report is all right, but with regard to the contract, a direct statement to Government in an official letter would have brought a direct answer from Government. As a matter of fact there may have been semi-official and unofficial letters, but they do not count as complete official documents. (*To the witness.*) Will you kindly turn to page 92, paragraph 118 : " I have not the proceedings of the meeting but so far as my recollection goes we unanimously considered that for various reasons the work could better be done departmentally. Meanwhile I had been giving the subject serious consideration from other points of view and I came to the conclusion that in the interests of economy it would be better to dispense altogether with the block wall and to revert to the scheme for a rubble wall throughout ". Can you give us any of the various reasons now? It is an important piece of work. You must be fully aware of the reasons. Why were the tenders dropped? That question was raised in Bombay by some of the witnesses.

A.—I have not got my reports here. I know it was considered more economical. In that connection I would like to point out that in Sir Lawless Hepper's evidence he inferred that he had not been consulted at all in the matter of those tenders. I do not think I have got it with me; I intended to bring it, but I can show you a note in my diary of that date in which I state that the tenders were considered by Sir Lawless Hepper, Mr. Lewis and myself and we unanimously decided it would be better to do the work departmentally. I will produce the diary after lunch.*

Q.—Some of the contractors complain that they were put to a lot of expenditure on that account. At the bottom of page 94, paragraph 123, you say: " It should be borne in mind that it was not possible to design the drains, cross-bunds or locate main roads until more was known about the lay-out of the reclaimed area and the preliminary scheme of Mr. Davidge, the expert town planner, was not received by me until March, 1922 ". Why was it not possible to design the drains, cross-bunds and main roads?

A.—Because nobody knew what was going to be done.

Q.—It says drains—that is, storm water drains—and cross-bunds. The development may be left out altogether. You have nothing to do with the development?

A.—No. I have only to repeat that it was not possible to design them until we had the lay-out.

Q.—Why do you want the lay-out? The sea wall is fixed, and that is the end of of the thing. You have nothing to do with the lay-out. Cross-bunds are part of the construction of the reclamation, and also storm water drains?

A.—Well, go to page 95. The Chief Engineer writes: " An inspection of Mr. Davidge's plan indicates the position of the storm water drains for the area of the reclamation. The drains have obviously to discharge under the sea wall and will naturally be placed on the axes of the main avenues running east and west across the area ".

---

* See Appendix XV.

Q.—That is according to Mr. Davidge's plan as shown; but there is no reason why storm-water drains should not be placed wherever you find it convenient to place them?

A.—The Chief Engineer here says: " The drains have obviously to discharge under the sea wall and will naturally be placed on the axes of the main avenues running east and west across the area ". We did not know the position of the main avenues running east and west across the area until we had received Mr. Davidge's lay-out.

Q.—On page 110, paragraph 137, you say: " As regards the dredger ' Sir George Lloyd,' we hold the opinion that whatever the class of material (short of hard rock and moorum) no better dredger could be procured for the purpose of the scheme and criticisms on the mechanical efficiency of the dredger are beside the point, because up to the present the dredger has had no opportunity of showing what she can do ". There are two or three points to be considered in this connection. You had no calculations to show that the dredger could give the output which you specified?

A.—You asked me that question yesterday.

Sir M. Visvesvaraya.—And you have not given us instances of any other dredgers of similar size which have given the output you have specified. In actual test they have broken down. They have shown themselves not capable of the appointed task. There are those three points. If you wish to state anything which makes you take such a hopeful view we shall be glad.

Chairman.—We must be careful about the phrase " in actual test " because the " Kalu " and " Jinga " and the " Sir George Lloyd " are all claimed, in actual tests, to have done their job. What you mean is daily practical working.

Sir M. Visvesvaraya.—They have been tested a whole season.

Chairman.—It is only in actual tests. We must be careful that that is not mistaken for the official test. You mean the daily working. Over a period of three years you have an output of less than 50 per cent.

Sir M. Visvesvaraya.—Yes. (*To the witness.*) What makes you take such a hopeful view that the dredger is quite capable of giving the specified output?

A.—I have expressed this opinion before the enquiry.

Q.—There must be some grounds for it. You have not given any grounds. If you can give us any we shall be interested to hear them.

A.—Well, confidence in the plant once you have put it in the hands of a contractor and got rid of all the people out there.

Q.—A dredger which can give 1,000 tons per hour cannot be made to give 2,000 tons per hour even if you put it in the hands of an excellent contractor. We want to know what makes you take the hopeful view that the dredger itself is a sound piece of machinery?

A.—I would refer you to Sir John Biles.

Q.—He refers many things to you. We have asked him " Why do you suggest that? Why did you accept that output? " and all that, and he referred us to you?

A.—This is obviously a question for Sir John Biles.

Sir M. Visvesvaraya.—He says " You had better ask Sir George Buchanan ". We are being sent from pillar to post. On page 112 you say in Clause 5: " Regarding my responsibility, I have no desire to evade any responsibility or unduly to blame anyone else. During the course of this inquiry I have been subjected to attack not only by witnesses but by members of the Committee ", and then you quote statements made in the course of the evidence. One is " Sir M. Visvesvaraya. Witness: Sir Lawless Hepper. (Q.) As regards expenditure for a huge work of this magnitude, responsibility must be that of the Director of Back Bay Reclamation works ". I put that question. How do you hold me responsible for any criticism there?

Chairman.—The criticism is in the answer. Sir George Buchanan objects to the answer which Sir Lawless Hepper has given. That is the point, is it not?

A.—That is the point.

Sir M. Visvesvaraya.—The statement says that he has been subjected to attack by members of the Committee.

Witness.—As regards that question, I think it was most extraordinarily proper.

Sir M. Visvesvaraya.—In that particular case at all events there was no criticism by a member of the Committee.

Chairman.—It is the answer of Sir Lawless Hepper. Sir George Buchanan does not agree with the way Sir Lawless Hepper puts it. You put a question which Sir George considers an ideal question, and Sir Lawless Hepper gives an answer which does not please Sir George.

Sir M. Visvesvaraya.—At page 114 you say: " Sir Lawless Hepper has made the remark that Sir George Buchanan was sometimes in Australia and sometimes in Africa

and it was not practicable to send all cases of tenders for contracts that used to arise. What an extraordinary statement!"—that is your remark—" I was not carrying out our duties single-handed—I was not even the engineer. My firm were the engineers and we had an office and staff in London actively engaged in carrying out the whole of our business." That is true, but you were personally responsible under the contract?

A.—No.

Q.—You had to give the greater part of your time. You say : " I was not even the engineer," but you were personally responsible under the contract for the job?

A.—No, I disagree.

Q.—You did promise to give the greater part of your time?

A.—No; I disagree. Evidence will be given, I hope to-morrow, by my partner, and you will see the amount of work he did while I was away.

Q.—I quite agree he may have done, but you were personally responsible under the contract which says: " Sir George Buchanan shall give the greater part of his time, etc." Did you give the greater part of your time?

A.—I have already replied.

Q.—Then on page 115 you say : " Moreover, I had never any intention of being any thing but adviser, and our fees were based on that arrangement." That question was discussed yesterday.

A.—Yes.

Q.—I do not want to go very much further into it. You gave advice when you thought necessary. May it not be that as you assumed no responsibility they took your advice only when they thought it convenient? They were not bound to take your advice always because you took no responsibility.

A.—They were not bound to take my advice, and very often they did not take it.

Q.—Might it not be because you did not take any responsibility?

A.—No ; I do not associate myself with that remark.

Q.—Then later on you say: " The creation of the Development Directorate and Department I consider, in the light of events, to have been a mistake." That is the creation of the Development Department?

A.—Yes.

Q.—Kindly tell me how you would carry out the work if you had your own way. Suppose the Development Directorate is abolished as far as this work is concerned, how would you carry it out? We want your own considered opinion.

A.—Yes. My considered opinion, in the light of events, is that of letting the work by contract, whatever the cost was.

Q.—Whatever the cost?

A.—Reasonably, I mean.

Q.—Could you do it within the estimate?

A.—I am not talking about within the estimate.

Q.—But anything can be done if regard is not had to the cost?

A.—You asked me what I would do. I say that the creation of the Development Department I consider, in the light of events, to have been a mistake. Very well. You asked me what, in the light of events, I would do, and I say that, in the light of events, I would let all these works by contract. Naturally, when I say at any cost I mean at any reasonable cost. I would abolish the Directorate to-morrow.

Q.—What guarantees are there that things will not go badly again? Merely leaving the work to contract will not help matters. What organisation would you substitute for the Development Directorate? What organisation have you in view?

A.—In my judgment you could not have a worse organisation than the Development Department.

Q.—What would be the organisation under your scheme if you abolish the Department? There must be somebody to control, somebody to measure up, somebody to take stock of progress, somebody to do the costing. What organisation would you have?

A.—It would depend entirely upon what the Government proposed. If they proposed to use engineers——

Q.—We have to make a recommendation on that point, and on your experience of the work you say that the Development Department should be put an end to. I want to know what alternative organisation you would put in its place. It would be a help to us to see exactly what you have in view. This is not criticism ; I am just asking your advice.

A.—In the case of the Back Bay scheme, supposing that the Government retained a firm of engineers like ourselves, or of similar calibre, I should recommend that the work be gone over very carefully, and the work should be let out on a contract basis.

This has already been discussed by the Chairman yesterday, and he said : " Well, you might get people who would take the contract on the basis of receiving so much of the land." That would be a matter for consideration.

Q.—Whom would you have as agents of the Government supervising the work? What Department of the Government would there be? There must be a Department of the Government to look after the work on behalf of the Government.

A.—Do you mean outside the Back Bay scheme?

Q.—For the Back Bay scheme only. You say you would do away with the Development Directorate. What other agency would you substitute in its place on behalf of the Government?

A.—If you take the Back Bay scheme by itself, the Public Works Department would take over the equipment of the reclaimed area, and if there were engineers in this country who carried out the work for the Government there would be no Department necessary.

Sir M. Visvesvaraya.—I quite follow that reply.

Chairman.—You do not mean that you would put the works in the hands of the Public Works Department? Would you put the equipment of the area when reclaimed in their hands?

A.—Yes.

Q.—But the reclamation is to be by the contractor or contractors working under the supervision of an engineer?

A.—Yes.

Sir M. Visvesvaraya.—An engineer under what Department—under the Public Works Department?

A.—No ; an independent engineer. We were not in the Public Works Department.

Q.—You were independent engineers. You want an engineer to be appointed in place of the Development Directorate?

A.—No. May I point out that analogous cases (if information is wanted on this point) are the numerous public works carried on by the Crown Agents for the Colonies in the Colonies who employ engineers in this country?

Chairman.—May I see if I have got that right? Your view is that an engineer should be chosen, and that tenders should be invited—world-wide, I suppose?

A.—No limit.

Q.—And that when you have got your contracts, and when you have got your engineers, the Public Works Department has nothing to do with the reclamation part of the work at all?

A.—Nothing whatever.

Q.—The hold that the Government has are the individual contracts with various contractors?

A.—Yes.

Q.—And their reputation, their solvency, and their ability?

A.—Yes.

Q.—That is what the Government looks to?

A.—Yes.

Q.—And they look to the reputation and supervising energy of the engineer?

A.—Yes.

Sir M. Visvesvaraya.—On page 117 you say : " I emphatically assert that the Back Bay scheme inaugurated by Sir George Lloyd is not a failure, and there is no reason why it should not be brought to a triumphant conclusion." But have you considered at what cost it could be brought to a triumphant conclusion? Could you do it within the estimate?

A.—That is an expression of my opinion. Naturally, by a triumphant conclusion I do not mean at an unreasonable cost. You would arrive at that when you begin making negotiations with contractors or taking tenders from contractors.

Q.—Would it be anywhere near the 702 lakhs estimate which was approved?

A.—Really that is not a question which I can answer.

Q.—Any work can be brought to a triumphant conclusion if regard is not had to the cost. You said that the cost was to be no consideration. That was the idea then. I do not think any Government would accept such a statement as that the cost was to be no consideration in considering an estimate for the scheme. That was the idea when you started the work, but I do not think that principle would be acceptable to any Government in these days.

A.—I went on to say that the slump in land values which at present obtains is not going to last for ever.

Q.—That is true; but I am talking of the cost of the work.

A.—To put it in another way: I consider there is nothing to prevent the work being brought to a satisfactory conclusion at a reasonable cost.

Q.—The prospect of profit has disappeared for the moment. They have to keep a close watch on the cost.

A.—Yes.

Q.—The work is delayed because it is going to cost a tremendous amount, and it is felt if it is to be brought to a satisfactory conclusion it should be done within a reasonable cost.

A.—Yes.

Q.—A reasonable cost must be some percentage, 10 per cent., or 15 per cent. on 702 lakhs. Do you think that work could be completed within that percentage with success?

A.—I cannot bind myself down to what I think is a reasonable cost.

Q.—I am much obliged to you.

A.—Thank you.

Sir H. Courthope-Munroe.—There is one point that has occurred to me which I should like to mention.

Chairman.—I do not at all want to criticise, but you are getting a little far away from the modest way in which you started, and, if I may say so, the correct way.

Sir H. Courthope-Munroe.—It was only on a question put by Sir M. Visvesvaraya. He put the question as to whether the estimate was in Sir George's opinion reliable or approximate. I do not want it to appear that Sir George was fencing with the question. He said he would look at the Oxford Dictionary.

Chairman.—Let us have the Oxford Dictionary meaning of the word " estimate."

Sir H. Courthope-Munroe.—That is all I ask for. It may appear to the looker-on as if he were fencing with the question. The Dictionary gives the meaning as follows: " Estimate: approximate judgment of number, amount," etc.

Chairman.—That is right.

Sir H. Courthope-Munroe.—Then the word " reliable " is defined as being of " sound, consistent character." So that it was impossible in view of that definition for Sir George to give a definite answer, because the word " approximate " is rather involved in the word " estimate." You will forgive my pointing that out; but that is the only reason I intervene.

Sir M. Visvesvaraya.—In engineering parlance " approximate " has a definite meaning. " Final estimate " and " approximate estimate " have different meanings in engineering language.

Sir H. Courthope-Munroe.—I leave it there, but " estimate " seems to involve " approximate."

Chairman.—Let me see if I can get the position quite clear about this. The word " estimate " does not import a definite guarantee of accuracy to the last decimal point?

A.—No.

Sir Frederick Hopkinson.—Under certain conditions, yes.

Sir M. Visvesvaraya.—Exactly.

Chairman.—If you say you have prepared a " reliable estimate," does it *not* mean that you have, as an engineer, taken out the figures with due care, and believe that the work can be done for the price?

A.—Yes.

Q.—It may be in certain circumstances put higher, but generally, perhaps that would be a fair way of putting it?

A.—Yes.

Sir Frederick Hopkinson.—I should like to carry that word " estimate " one little step further. If I, as a contractor, give you an estimate for doing certain work for a certain sum and you, as an engineer, accept that estimate, I have to carry the work out for that estimate have I not?

A.—If you give me an estimate.

Q.—And you accept it?

A.—Yes.

Q.—If you, as an engineer, give the Government an estimate for carrying out certain work, you have such things as supplementary estimates?

A.—Yes.

Q.—Which have a totally different meaning?

A.—A totally different meaning.

Q.—The Chairman has been so very exhaustive that he has left me very little to do but in order that no points may be missed I shall have to go generally through the whole thing, and you will forgive me if I ask any questions that the Chairman has already asked. I will do my best to avoid repeating any question, and I will try to be as short as I can. Before we commence on it I should like to refer to that letter you read out this morning to Sir George Lloyd, where you objected to the term " consultants " as applied to your firm. You have also objected to being called " executive engineers "?

A.—Yes.

Q.—Would you explain to me what half-way house there is between the two?

A.—Well, you perhaps know there is a good deal of ambiguity about consulting engineers and engineers. The late Mr. C. S. Meik used always to object, under any circumstances, to be called a consulting engineer. His view was : " I am not a consulting engineer."

Q.—It is a very common phrase to use?

A.—It is a very common thing indeed. I do not think there is much difference, but I was alluding to the position in connection with Public Works in India. Take the various Port Trusts in India. They have their consulting engineers at home. They are agents for the supply of materials. They never consult those engineers about the works or about anything unless they want to, and my fear was that we were going to be pushed out to such an extent that we were only going to be used as engineers when they wished us to supply tools in the same way as a consulting engineer for a Port Trust. That was the meaning of the expression.

Q.—But they have their own Director General of Stores to do all that, have they not?

A.—Government have their own Director General of Stores, but in this case it was decided that we were to do it.

Q.—In the one case you get a fee over the whole work, but the man who simply is employed to supply plant, and so on, only gets a fee on the value of that plant?

A.—Yes.

Q.—That is a very different thing?

A.—That is a very different thing.

Q.—I have been in a great deal of trouble about this Clause in your agreement, and I have been much governed in opinion by your own statement in which you say : " We interpreted our agreement to mean that we are the actually responsible engineers." That seems to me very comprehensive.

A.—Yes.

Q.—What limits your responsibilty there? There is no limit, is there?

A.—The responsible engineers for seeing that our plans were carried out.

Q.—For the design and execution of the works. The word " execution " I believe is used in another place.

A.—It is not the execution of the works—yes, the execution of the works in the sense of having a representative and seeing that the works were carried out.

Q.—I think it means more than that. I think it means really what it says—that is, the execution of the works.

A.—Well, we never interpreted it in that sense. You have got to take the facts which I have laid down, that we had no power whatever. We had no power and no control.

Chairman.—Sir George and Sir Harry, this is, in our opinion, a very curious and very difficult agreement. I do not know whether you have studied it at all, but I think if you would consent to extend your powers here a little, and would just address us for half an hour at some time on the text of this agreement, and on the point as to how far Sir George was responsible for the execution of the works as apart from supervision, it would be very useful.

Sir H. Courthope-Munroe.—I follow you.

Chairman.—If Sir George is willing that you should do so just to help us, only on that one point and nothing else—I think it would be an advantage. Nothing about the termination of the agreement, but just for you to take Clause 1 and discuss it with us and contrast it with Clause 2. Are you willing that that should be done, Sir George?

A.—I am, certainly.

Sir H. Courthope-Munroe.—You will allow me to do that to-morrow?

Chairman.—At any time convenient to yourself.

Sir H. Courthope-Munroe.—Yes; that would necessarily involve looking up some matters.

Chairman.—The position is that Sir George's firm may be engineers in supervision of the works without any executive duties. On the other hand, pushing it to its extreme

limit, he may be responsible for the execution of the works. That is the extreme limit in which he is engineer plus contractor.

Sir H. Courthope-Munroe.—Quite so.

Chairman.—Those are the two opposite views.

Sir H. Courthope-Munroe.—I quite appreciate the point.

Chairman.—He may in fact hold a sort of hybrid position in which he is engineer, and yet by virtue of supplying various articles and certain drawings and plans, he may be, in those circumstances, assuming the position of contractor. It is the measure of responsibility that one would like to have discussed under this agreement. If you could just, within the limit of half an hour, put Sir George's view and your interpretation of it as a lawyer, it would help us.

Sir H. Courthope-Munroe.—I gather you are asking me for that—an interpretation from the point of view of the law?

Chairman.—Yes; your interpretation as a lawyer, and what you say is the true construction of that agreement on that one point—engineer, executive power, contractor. One end the engineer, and the other end engineer plus contractor. It is a very curious agreement.

Sir H. Courthope-Munroe.—Quite.

Sir Frederick Hopkinson.—It is a very important point, because I have read it in one way which gives a totally different position to that assumed by Sir George Buchanan.

Sir H. Courthope-Munroe.—I quite appreciate it.

Sir Frederick Hopkinson.—It is capable of that reading, but we want to know the proper reading. We do not want to have a wrong reading of it.

Sir H. Courthope-Munroe.—You may not obtain even that until you get the Judgment of the House of Lords; but in answer to your questions, what I would suggest is for the purpose of this Inquiry you have to look at what in fact it was understood to mean by all the parties.

Sir Frederick Hopkinson.—I quite agree that that is very important.

Sir H. Courthope-Munroe.—I suggest so far as this Committee is concerned that is the position. I fully appreciate the importance that Sir Grimwood Mears attaches to the real legal meaning of the document; but for this Inquiry you have to look at what everybody thought it meant.

Chairman.—Certainly.

Sir Frederick Hopkinson.—I quite agree.

Sir H. Courthope-Munroe.—I fully appreciate the point. The same point had struck me when I read the papers.

Sir Frederick Hopkinson.—In the meantime that will not prevent me asking these questions that I have already decided to ask.

Sir H. Courthope-Munroe.—No.

Sir Frederick Hopkinson.—While we are on that point, I should like you to bear in mind, Sir George, that reading the document exactly as it is written there has coloured many of the questions that I have put to witnesses in Bombay.

A.—I appreciate that.

Q.—Have you got any plan made in 1919 showing how you proposed to work the dredgers—their position, etc?

A.—No, I have not got any plan made in 1919.

Q.—Can you tell us how you proposed to work the dredgers? I particularly want the non-technical Members of the Committee to understand this point, as you and I of course do.

A.—In 1919?

Q.—Yes; when you made your report in September can you tell me where you were going to put your dredgers, in order to make the reclamation?

A.—Certainly it was not put down on paper, it was discussed.

Q.—Discussed with whom?

A.—It was discussed with Mr. Meik.

Q.—What conclusion did you come to?

A.—Well, the conclusion, so far as I can remember when it was decided to begin the wall at both ends——

Q.—I am speaking now of 1919. There was no question then of building the wall at both ends?

A.—No.

Q.—Will you take your plan from that pocket? There you have got pipe-lines 1, 2 and 3?

A.—Yes.

Q.—Your limits of delivery of the material from the booster was 5,000 feet, I think?

A.—Yes, 5,000 feet from the booster.

Q.—I have plotted these on to this plan, and it seems to me that it was impossible for your booster to deliver the material into either one of the sites shown on your plan, that is to cover the sites?

A.—I know it was discussed at the time; and the reply is that we had at the back of our minds a land booster in addition.

Q.—But that does not appear in the estimates?

A.—No, it does not. We discussed it a great deal, and we thought it might be necessary to have a land booster. On the other hand we were not certain whether it would not be more economical to use 14,000 or 15,000 more feet of pipe-line at a reduced output.

Q.—Had you done it at a reduced output, your whole programme went, did it not?

A.—We did not mean a reduced output for the whole of it.

Q.—It is not the fact that at one time you thought of this land booster working in conjunction with the one dredger in the harbour, and not in conjunction with the "Lloyd" and the "Colaba"?

A.—No; we always had the idea that we sould want a land booster in conjunction with the "Lloyd" and the "Colaba."

Q.—I know that appeared subsequently when you are making progress at a later date—a year or two years or three years later—and if I remember rightly the price of this land booster was £172,000?

A.—The land booster?

Q.—Yes.

A.—What we were considering at the time was this.

Chairman.—Do you agree the price? Is that approximately right—£172,000 for what was called a shore booster?

A.—I do not recollect it. I have no recollection of that.

Sir Frederick Hopkinson.—That will come later on, when I go through the figures. Surely if you thought of using a second booster—that is equal to a third dredger—it was going to increase your price by nearly 50 per cent., was it not?

A.—We had no suggestion of having a booster to cost £172,000. You must remember this is a long time ago, and I cannot remember all the details.

Q.—I understand that.

A.—I remember in discussion with Mr. Meik that we thought we might have a land booster worked by electric current.

Q.—You intended originally to have a booster worked by current, but you found that the current was not available?

A.—That was right.

Q.—Therefore you put in the "Colaba"?

A.—That is right.

Q.—A steamship?

A.—Yes.

Q.—But is not that only reverting to your original programme of having two machines for doing the entire work, because in your report there is no reference whatever of any kind to a third machine for delivering the spoil?

A.—No, that is quite true.

Q.—Had you really seriously intended that? Surely there would have been a mention of it, would there not?

A.—Any work outside the report as it stood we would not make a definite statement as to——we would see how things worked out.

Q.—But that would vitiate your whole estimate, would it not? That would illustrate the definition I gave you just now of the difference between the contractor's estimate and the engineer's estimate? That would really come in the nature of a supplementary estimate?

A.—Yes, but at that time things were put into what fraction of an anna is this going to put on to a square yard of land.

Q.—I am far, shall I say, too non-political a person to consider anything of that kind.

A.—That is my answer. I have nothing more to say.

Sir Frederick Hopkinson.—I want my colleague to understand this point, so I will just put this plan on the wall, and I will make a few remarks about it.

Sir H. Courthope-Munroe.—Is this plan No. 1?

Sir Frederick Hopkinson.—Yes; I am taking the same plan that you have. We have larger ones here, but I think it better to take this one, so that you can follow it more easily. Here is pipe-line No. 1 and here is pipe-line No. 2, and here is pipe-line No. 3. This is the area of dredgable material?

A.—Yes.

Q.—Assuming that your dredger is somewhere in this area, the "Colaba", that is the booster, would be in that position. Now here the limit of practical effective dredging is 5,000 feet, and that is represented by this pencil line which I have etched as her maximum delivery. That means that all this area could not be done by the "Colaba" at her maximum rate of output. It is quite a large area. I would also point out that the reclamation nearer the wall is much deeper than it is here. It begins practically at nothing here, and goes out to about 15 to 20 feet up here. Consequently this is a very large proportion in quantity and area of the reclamation. To give you an idea of the quantity the distance beyond which you could pump effectively to the sea-wall is 1,700 feet. That is getting on towards half a mile. In the case of No. 2 pipe-line here is a similar radius of 5,000 feet drawn on, and that shows also that she could not do it. Now when we come to pipe-line No. 3, the "Colaba" being here, and the "Sir George Lloyd" being somewhere in that radius, 5,000 feet, the maximum distance to which she could pump is shewn by this line here. That means all this portion here could not be done at her effective rate; and this portion from here to the end, which is Block 1 and Block 2, is a distance of 5,000 feet. So that when your dredger has finished that distance, she has still 5,000 feet to do. 5,000 feet is practically a mile, or the distance from this room to the other side of Victoria Station—that is your pipe-line to the end here. There is no possible means of filling the area from here to the other side of Victoria Station. Therefore I want to suggest to you that your scheme as a scheme broke down before it started. Do you agree with that?

A.—No.

Q.—Will you tell me why?

A.—No. I should have to think over it a great deal before I gave that answer.

Chairman.—Will you think it over, because that is a very crucial matter. I think you had better take this map and Sir Frederick had better etch this out in red and green, so as to distinguish between them, and I think you ought to give some more clear answer to this question. It is a matter of figures.

Sir Frederick Hopkinson.—It is only a matter of arithmetic.

Chairman.—It is not a matter of anything else except measurement. Apparently on your own plan Sir Frederick points out that there are many areas which are beyond the pumping area of the "Sir George Lloyd" and the "Colaba" combined, which was 10,000 feet. If that be so, he asks you whether there was not a serious miscalculation?

A—.I shall have to look up my papers. My recollection is that we had always that land booster up our sleeve.

Chairman.—I will just pass you this plan.

Sir Frederick Hopkinson.—I will put my initials on it, and then we shall know where it is.

Chairman.—You follow how the various parts begin and where the "Colaba" is?

A.—I do.

Chairman.—You see the semi-circle which marks, according to Sir Frederick, the utmost limit of the pumping capacity of the dredger and booster combined?

Sir Frederick Hopkinson.—That is their effective output.

Chairman.—It is the two pipe-lines of 5,000 feet each. Then there comes the central area, and he also points out that there is 1,700 feet not provided for. That is 1,700 feet up on the sea-wall and at the maximum depth. Then he takes the centre of the plan, and again shows you a certain area that is outside the limit of 10,000 feet, and eventually we get two blocks each of which, if the figures are right, are very seriously outside the 10,000 feet. That was the point of my question yesterday or to-day, when I asked you whether it was physically possible, with 10,000 feet of pipe-line, to pump into areas 1 or 2?

A.—Yes.

Q.—You have prepared many memoranda in this case; but would you just give us the whole story on about half a sheet of foolscap?

A.—I will see what I can do.*

Chairman.—Thank you very much.

---

* See Appendix IX.

Sir Frederick Hopkinson.—Even supposing you got another 5,000 feet of pipe in order to do that, you could only do it by materially affecting the quantity of output. Is not that so? If you have your pumps double the length to pump through, they will only pump half the quantity?

A.—As a matter of fact we found out that with more than 10,000 feet the pump was pumping full bore.

Q.—That is a fallacy. You know what a pump can do. It is all horse-power. It is all work. Whatever one may think, it is bound to be a fallacy. I started the same thing in Bombay, but as soon as I came to settle down and think it out, I saw it was a fallacy.

A.—All right.

Q.—If the dredging output in the past has been in the neighbourhood of 1,000 cubic yards an hour, it follows that at the end of the extra 5,000 feet of pipe-line your output would be reduced to 500 cubic yards an hour. There are 4,500,000 cubic yards in these two blocks 1 and 2. That means something like ten years to do these two blocks —nine or ten years—which, of course, kills the scheme as a scheme.

A.—Nine or ten years to do what?

Q.—They have only been doing about 1,000,000 a year?

A.—Yes.

Q.—If you cut that down to half on account of the extra distance, it is nine years' work, taking 4,500,000 yards to do the two blocks only?

A.—You are talking of what they have done in the past?

Q.—Yes; we will have a lot of questions about that directly but we always judge people on what they do, rather than on what they say, do we not?

A.—Yes.

Q.—It is a much better way of doing it. There is one other outside point I would like to refer to before we get into the details. A question I put to Lord Lloyd has been very widely reported, in which I asked him if he really thought you had been entirely loyal. I will tell you exactly what was in my mind at the time. The first year, 1923, the working of the dredger was a failure, there is no other word for it. The second year was a worse failure. The third year was no better Having the view that I hold as to your position under which you were entirely responsible, you left Bombay on 7th January, 1925, shortly after the beginning of the working season, and you went to Australia and were entirely out of touch with the whole work until the following October; is not that so?

A.—Yes.

Q.—It seemed to me—and I generally use rather blunt language perhaps—that that was leaving them in the lurch. I may be entirely wrong, but that was my view at the time, and that was why I put the questions as I did to Lord Lloyd.

A.—Yes.

Q.—You see how my mind has worked?

A.—I see. I do not accept your view.

Q.—It depends upon the reading of that agreement?

A.—Yes. Mr. Halcrow will be giving evidence here; he will be showing exactly the amount of work that was done by him in my office while I was away in Australia.

Q.—I am very much impressed by your interview with Lord Lloyd on the 28th May, 1919, in which he said that he was relying absolutely upon you personally, and adding, quite pathetically I thought, " You will not let me down." That seemed to me to call for almost any sacrifice on your part.

A.—That was with reference to this particular report.

Q.—Was it not meaning that he was really relying entirely upon you? He was putting all his money on you, and pathetically asking you not to let him down?

A.—I repeat that was with reference to this particular report.

Q.—Was it not the scheme? Was it not by carrying out the scheme?

A.—No. There was no discussion at that time as to that.

Q.—You were appointed the Engineer?

A.—Afterwards.

Q.—But are not the two things the same?

A.—You may make what interpretation you choose of that.

Q.—The Committee will, of course.

A.—The Committee will.

Q.—I should like to run through your evidence given to the Chairman on the 28th. With regard to Mr. Kidd's estimate, which we shall come to a little later, I want to

emphasise what you said in almost the first question asked, that you had never seen more detailed information than you got in Mr. Kidd's estimate. Is not that so?

A.—No ; I do not remember that.

Chairman.—Was not that with reference to the borings only?

A.—That was with reference to the borings only.

Sir Frederick Hopkinson.—You say the borings only?

A.—Yes.

Chairman.—At present Sir George says that refers to the borings only, and that is my recollection.

A.—I am quite certain it was with reference to the borings only.

Sir Frederick Hopkinson.—I want to go through these things so that they are not omitted, and we will come to the general dredging afterwards. You said also that the staff out there were determined to dredge in the hard?

A.—Yes.

Q.—Why should they be determined to do that, to give a poor output?

A.—Well, the fact remains that they were determined so to dredge in the poor material.

Q.—But why should they?

A.—I do not know why they should ; perhaps it was easier for them.

Q.—No, it is more difficult. It is hard material and they are getting a poorer output.

A.—We are bringing evidence on that.

Q.—Never mind about that for the moment. Why should they want to show a poor output in the dredger?

A.—I have not the faintest idea ; but the fact remains that we assert positively that they insisted on taking what you might call the last ounce of it, which we criticised, and requested them to dredge in more suitable material.

Q.—Is not it the fact that at this time your dredging area had been restricted so that you had to take all the material you could get?

A.—No ; we were not obliged to go and take unsuitable material.

Q.—But you were showing in your various estimates that you were not going to have enough material to fill the reclamation after the Indian Marine had stepped in and prevented you from dredging for certain areas?

A.—No ; we showed how we could—that was Mr. Lewis showed—how we could get enough material.

Chairman.—But he showed a deficit of 7,000,000.

Sir Frederick Hopkinson.—I suggest to you that they had to dredge the whole of the material they could get near the reclamation : they had no choice in the matter?

A.—Well, I do not agree.

Q.—We shall come to the figures later on. I understand you are quite right, and it was a question of the borings?

A.—Yes.

Sir Frederick Hopkinson.—It is my note that is wrong.

Chairman.—No ; Sir George said " I had never seen a scheme with greater detailed information in respect of material." I put it to him " borings ", and he speaks of " material ", but he did not mean it in the widest sense.

Sir Frederick Hopkinson.—The one is the result of the other. You speak of the " Jinga " doing extraordinarily well and doing excellent work, and at the same time it was referred to in your report as a warning. I do not quite follow that?

A.—You will find in Mr. Kidd's evidence he talks about the wonderful work of the " Jinga ".

Q.—He had nothing to do with that work ; he was not concerned in it?

A.—No. I am talking about what Mr. Kidd said in his evidence the other day here.

Chairman.—I will summarise it. Mr. Kidd said he was in touch with Mr. Messent, and he said that the dredger people were very chary about putting the " Jinga " or " Kalu " on to anything except mud : that he persuaded Mr. Messent to try the " Jinga " in blue clay, and she did very well in blue clay, and he emphasised that. That is the only association Mr. Kidd had with it.

Sir Frederick Hopkinson.—Quite so. Did he know the output of the dredger?

Chairman.—It was 1,426—two-thirds.

Sir Frederick Hopkinson.—It is about 30 per cent. less than it ought to have done. What is the meaning of that paragraph that the dredging on the Sewri reclamation should be a warning?

A.—Well, I was examined yesterday by the Chairman on that point, and I have nothing really to add to what I said.

Q.—I shall have some further questions to ask you when I come to the dredging subject, so I will leave it for the moment. As to bonus on output, it has been given in evidence that they paid a bonus on output, and that the bonus scale was fixed by you, and nothing appreciable resulted from it. Have you ever been advised of that?

A.—No. So far as my information goes they did not adopt a bonus scheme on output.

Q.—That is what they told us?

A.—Well, I am bringing evidence on it.

Q.—I remember asking Girdwood if he had a satisfactory bonus, and he mentioned a figure. I said, " Well, that is very small, is it not? " and he said, " Well, it is acceptable," and we were told that you had laid down the scale of bonus.

A.— I would rather evidence was given on that subject by my partner.

Q.—You said also, in answer to the Chairman, that you never saw the soundings that were made after the dredger began to work?

A.—That is correct.

Q.—How could you supervise and control, or advise the Government as to the way the work was being carried out, unless you knew frequently and exactly what the dredger was doing?

A.—I was not in executive control of the work; I was only there for short periods, and I took the information that was given me.

Q.—We were told that the Government could never know until July or August what the dredger had been doing in the previous December?

A.—Yes.

Q.—I made some perhaps rather strong remarks about that, and then I was told that soundings were taken every day, reported to the office every day, and then I said at once: " Why did you not know at least every week exactly how much the dredger had done? "

A.—Yes.

Q.—How could you judge the performance of the dredger unless you knew what it was doing? You reported that the work was going on satisfactorily. How could you tell unless you had these soundings measured up?

A.—We were not in executive control, and we had a Resident Engineer there who was also Chief Engineer.

Q.—But you are personally responsible for the supervision and for the provision of the dredger. How could you tell what the dredger was doing unless you insisted on having the weekly reports?

A.—I was not in executive control of the work.

Q.—How could you advise the Government as to whether the work was going on satisfactorily or otherwise?

A.—I would advise the Government on general lines.

Q.—But general lines does not mean anything. It is purely a question of what the dredger is doing. There is nothing general about that. It is very particular indeed.

A.—Well, nobody knew what the dredger was doing.

Q.—I am asking you why you did not know. Why did not you insist upon being told; because my suggestion is that you could not supervise the works unless you did know?

A.—Very well. Then there is nothing for me to say.

Chairman.—Is not that the fact?

A.—What?

Q.—Is not it the fact that you would know as an engineer of experience that you could ascertain the work of the dredger by taking soundings of her previous work?

A.—Yes.

Q.—Mr. Lewis was your Resident Engineer?

A.—Yes.

Q.—They say that soundings came in day by day?

A.—Yes.

Sir Frederick Hopkinson.—And weekly reports were available.

Chairman.—Supposing on the 20th December, 1923, 12 days after the dredger had begun to work, you had said to Mr. Lewis, " How is the dredger working? " and he said, " I do not know," would not you, with your experience, have turned round on him and said: " You had better find out within the next two hours. Why do not you calculate your soundings? " The point Sir Frederick is trying to make is that you

could have got the information in the ordinary way in which information is obtained in these matters, namely, by a calculation of soundings, and you could from that have ascertained at once that the dredger was not giving 50 per cent. of her output. That is the point. Will you deal with that?

A.—My reply is that I was only in Bombay for limited periods, and we went on the pumping hours, not on the general results of the reclamation. There was a Chief Engineer and a Dredging Superintendent, and I went on their reports.

Sir Frederick Hopkinson.—But you did not get the results of the dredging until the following July or August?

A.—Very well.

Q.—By that time the whole season was over?

A.—Yes.

Q.—You could not make any alteration; you could not say: "You are doing badly; improve it," because you did not know?

A.—Well, I have nothing more to say on that subject.

Mr. Billimoria.—Was it not your duty to know it?

A.—I am being examined by Sir Frederick Hopkinson.

(*Adjourned for a short time.*)

Chairman.—It has occurred to me that you must be very tired. How would it do to interpose Mr. Halcrow and Mr. Settle to-morrow? We ought to be able to finish those two witnesses in the day quite easily, ought we not?

A.—I cannot tell very well. You have got the statements.

Q.—What I was thinking of was, that we might be able to manage to hear Mr. Halcrow's evidence and Mr. Settle's evidence to-morrow even if we sat rather late to do it, and then if it were necessary for you to come for a couple of hours on the next day that would give you a day's rest?

A.—Yes. I would like to consult Mr. Halcrow, but I think that would be very suitable.

Q.—Then let us leave it at that. We will try to get Mr. Halcrow and Mr. Settle finished to-morrow so that it shall not disorganise your office?

A.—I will be glad to answer the question that was put to me about the circles.

Q.—Will you please do so.

A.—Sir Frederick Hopkinson put a plan on the board with a number of circles on it, and shewed that in one case it was 1,700 feet from the 10,000 feet line to the extremity of the dredging. He said: "Does not this shew that your scheme was a failure from the beginning," or words to that effect?

Q.—That question included all the three. There are three semi-circles?

A.—Yes, there are three semi-circles. It illustrates the extraordinary difficulty of replying to technical questions by question and answer. You suddenly have a thing thrown at you that you have not considered perhaps for years and years, and it is not possible in a moment to give a reply. I would suggest with regard to questions of this kind that if Sir Frederick Hopkinson would write them down we will reply to them, but in many cases they require references to all our office plans and files, and it is hardly possible to expect answers instantaneously to questions thrown from the blue on matters of this kind. Now I will reply to this question. I have not had much time to think about it.

Q.—Why not defer your reply? You left the matter before the adjournment that you would write a short memorandum on it; why not do that?

A.—I will do that, but may I suggest that it would facilitate matters if Sir Frederick Hopkinson will put questions of this kind down on paper and let us have them.

Q.—I think we will go on as we are going and see if there is any question with regard to which you feel at a disadvantage in answering on the spur of the moment, and if that is so that shall be noted. Otherwise I think one could get along with most of the questions. There may be a question such as that, and then you shall have time to consider it. At all events, do not answer any question at all like that without giving the matter full consideration, or writing us a supplementary note, so that you shall feel that you have answered the question exactly as you would wish to have done?

A.—It is much more convenient to write a supplementary note.

Q.—Up to now the only matter outstanding is that question on your own plan. Will you write us a little note with regard to it?

A.—Yes.

Q.—That will do quite nicely. If any other questions of a highly technical and complex character arise we will adopt the same plan?

A.—It is impossible for me to remember everything that has happened in the last seven years in order to reply to technical questions.

Q.—We will get along as best we can with regard to it?

A.—Yes.

Sir H. Courthope-Munroe.—I understand that Sir George Buchanan is in a position to answer the question about the plan now.

Chairman.—No, not quite.

Witness.—We will leave it over.

Sir Frederick Hopkinson.—Of course, many of my questions arise out of answers that we have been given during the proceedings, and therefore it is impossible for me to put them down a day or two beforehand. I want to be quite sure that I properly understood you on the 25th and the 28th when you told the Chairman that you never contemplated going into Back Bay at all; is that so?

A.—On what date? I never contemplated originally going near Back Bay.

Q.—Quite. Both you and Mr. Kidd considered the question of dredging from Back Bay, and you both equally condemned it as being quite impracticable?

A.—That is correct.

Q.—And in view of the figures given us by Mr. Lewis, it would appear that you were both wrong, because he says that you can get 24 million cubic yards there?

A.—Yes, he does, but I would not say that we were wrong, because I do not admit that he was right.

Q.—You agreed with him?

A.—We agreed on borings, certainly.

Q.—You agreed it was quite impracticable?

A.—We agreed it was quite impracticable.

Q.—On account of the rocks, and various other things?

A.—Quite so. Mr. Kidd and I were in agreement.

Q.—Absolutely, and, as I say, you were both wrong, according to Mr. Lewis?

A.—According to Mr. Lewis, yes.

Chairman.—Then you go a step further, and you say: "Mr. Thomas, who took the borings and communicated them to Mr. Lewis in my belief made a series of mistakes"

A.—Yes.

Sir Frederick Hopkinson.—I am coming to that now. We have been given a list of borings at Back Bay, and it is on those borings that the "Kalu" first went there in the year 1924; on the same borings the "Kalu" went there in the succeeding year 1925-26, and on the same borings the "Kalu" is going there about now for the third consecutive season. Your intimation that these borings were all wrong is the first intimation we have had that there was anything wrong with them?

A.—Yes.

Chairman.—There is nothing that I know of on the documents that states in anyway that those borings were wrong up till now, except your own evidence.

A.—Yes. I think evidence will be given to that effect by Mr. Settle who went out.

Sir Frederick Hopkinson.—They showed us out in Bombay a large plan showing a large number of borings. I forget the number, and I forget the area, but it showed quite a large area on which they worked the dredger for the last season, and on which they propose to work it for the present season?

A.—Yes.

Q.—Of course you would never think of grounding a boat like the "Kalu" in Back Bay, would you?

A.—Not from what I know now, but on those borings, which showed soft clay——

Q.—I mean grounding it on the existing surface?

A.—That is a matter of opinion. When I saw those borings showing sand and soft clay, sand and soft clay, sand and soft clay, I did consider at one time that it might be possible to get her in and make her dig out a hole for herself.

Q.—That is what she did the first season, but that is not my question. I said would you, under any circumstances, ever think of grounding the "Kalu" in Back Bay?

A.—Grounding her?

Q.—Yes, letting her go in and take the ground, and stay there at low water every tide? It would be a very injudicious thing to do?

A.—I would not do it.

Q.—You would never think of it?

A.—No.

Q.—Nor would I. I am just running through your evidence. You said that Mr. Elgee wrote to you in July, 1924, asking if you had made arrangements for a staff for a double shift. Who made arrangements for the staff for the dredger; who engaged them?

A.—Do you mean the European staff?

Q.—The European staff?

A.—They were engaged by the High Commissioner.

Q.—Not by the Engineer?

A.—No.

Q.—Has the High Commissioner any qualifications to enable him to judge as to the capability of a dredging master?

A.—Not to my knowledge. The procedure was that the Development Directorate wrote to the High Commissioner, and the High Commissioner advertised in the papers. We were not consulted as to wages, conditions of service, and so on.

Q.—Were you not?

A.—No.

Q.—So you did not control the expenditure at all there?

A.—No. Then a small Committee was appointed of officials in the India Office to consider applications, and Mr. Settle went as an adviser to the High Commissioner's Office, and said what he thought about the people.

Q.—As a technical expert in dredging, he ought to have dominated the Committee, ought he not: in effect, he would say who ought to be appointed?

A.—I suppose he would say who ought to be appointed, yes.

Q.—I suppose if you took all the people together, and made them into one Committee, you could not find anybody in the India Office who knew about dredging, or dredging masters?

A.—No, but we were not consulted as to the terms, and the rates of pay.

Q.—Who decided what dredging masters were to be appointed; how many, and so on?

A.—That was decided in Bombay by the Government Directorate.

Q.—You appointed Mr. Brims?

A.—We nominated him.

Q.—That is practically the same thing?

A.—I was in Bombay, and I said: "You must have a separate head of the dredging. You cannot do it with anyone out here," and then we were asked, and we nominated Mr. Brims.

Q.—And also Mr. Speirs, I presume?

A.—I rather think that Mr. Speirs went out with the dredger, and remained on.

Q.—As I read it, it was more or less a matter of luck that Mr. Speirs happened to be there at the time, and he was appointed out there?

A.—He went out with the dredger, I think.

Q.—No, I think not. He went out to erect the floating pipes for Messrs Simons & Co.

A.—Not in this case, I think.

Q.—Yes, he told us that was what he went there for. He was there for some months before the dredgers?

A.—Yes.

Q.—He went there to erect the floating pipes, and as a consequence of his being there he was engaged to take charge of the dredger?

A.—You are probably correct.

Q.—Your revised estimate of the sea wall was 213 lakhs as against the original estimate of 118 lakhs. Had the sea wall been altered in character in any way to account for that difference in cost?

A.—No, I do not think it had been altered to any degree.

Q.—It had been reduced in cost?

A.—That is a question that I could not answer without consideration.

Q.—For instance, had not the concrete blocks been dispensed with?

A.—The concrete blocks had been dispensed with, yes.

Q.—I think they were estimated to cost 43 lakhs?

A.—Yes.

Q.—And some large stones were substituted which the project estimate put at about 6½ lakhs. Then was not the concrete wall reduced in thickness?

A.—I think they wanted to put solid blocks at the top of the concrete wall, and on one occasion when I was in Bombay, on my own initiative I said: "It seems a waste of money to put solid concrete. Put hollow blocks, and fill up the interstices with rubble,"

Q.—Was not it reduced in width?
A.—The first 2,000 feet was reduced in width.

Q.—Was not it reduced in height also?
A.—That I cannot say.

Q.—You may take it from me that it was. It is quite clearly in the correspondence. Therefore your original estimate, instead of being 118 lakhs, should have been 118 lakhs less about 40 lakhs, so that would bring it down to 78 lakhs?
A.—I will not argue the point.

Q.—You can take my figures.
A.—Yes.

Q.—I am quite sure of them.
A.—I will take your figures.

Q.—So that when you got this estimate of 213 lakhs, that was really multiplying the original estimate by three, approximately?
A.—Yes.

Mr. Billimoria.—The figure ought to be 200.39 lakhs. There is a misprint there.

Sir Frederick Hopkinson.—I think I took out these figures myself.

Mr. Billimoria.—If you take the total you will see that the 13 lakhs ought not to have been there.

Sir Frederick Hopkinson.—It does not make any appreciable difference.

Mr. Billimoria.—I totalled it up and found it out.

Sir Frederick Hopkinson.—(To the Witness) would you mind looking at the sample of mud that is here? That is a can of what has been called silt?
A.—Yes.

Q.—It is taken from the reclamation?
A.—Yes.

Q.—It has been called silt generally throughout the proceedings. I suggest that that is quite a wrong name, and that it ought to be mud, and mud only. You will find that there is practically no sand in it at all. You get a few grains of very, very fine sand, but quite a small percentage?
A.—Yes.

Q.—Silt, as I understand the word, means that it is largely composed of fine sand?
A.—Very often you see the expression silt and sand.

Q.—Yes, silt and sand, because silt contains sand?
A.—Pure alluvium you call sand.

Q.—Pure alluvium I should call mud, I think. That is mud, without any question?
A.—In Mesopotamia we used to call the material silt. You would call it mud, probably.

Q.—Yes. That material that you have seen there, when it has passed through two pumps, I think could only be described as dirty water, could it? When it has been agitated by two centrifugal pumps it is only dirty water?
A.—Yes, I am inclined to accept that view.

Q.—Do you think that is a suitable material for forming reclamation?
A.—Apparently they have been forming reclamation with it.

Q.—If you had seen that in September, 1919, would you have recommended the Government to use that for reclamation purposes?
A.—If I had seen that?

Q.—Yes.
A.—It is not a question to which one can reply at once, because Mr. Kidd had already stated his opinion.

Q.—I am not asking you Mr. Kidd's opinion. I am asking for your opinion?
A.—It is a very difficult question to answer right off.

Chairman.—Are you in any doubt about it?
A.—What I am thinking about are the present results.

Q.—The question that is put to you is: Suppose that had been shown to you in 1919 before you had made the Report would you have regarded that as suitable material for reclamation, or would you, in your own Report, have said that there was a very large area superimposed upon the mud which, in your opinion, was unsuitable for reclamation? That is really the question.
A.—I did regard it as suitable, because I think in my Report——

Q.—Yes, you did, but then you had not seen it. That is the point that is being put to you. Now that you have seen that material, are you of opinion that that would make good reclamation, and would you have recommended the reclamation with the knowledge

of the existence of all that mass of material that had to be dredged before you could get to the blue clay?

Sir Frederick Hopkinson.—That is the point.

Chairman.—Just think it over and tell us. Just take it quietly.

A.—Yes, I think I should have recommended it for the bottom; in fact I did recommend it as the bottom layer.

Sir Frederick Hopkinson.—Yes, I was just coming to that.

A.—With the clay superimposed upon it.

Q.—I noticed that you said that. As we saw that material out in the actual reclamation I sent a man in to go and pick me a piece of clay some fifty yards away, and to my utter astonishment he went in up to *here* (*indicating chest*).

A.—Yes.

Q.—And he struggled manfully through it, and got the piece of clay. I would like to ask you how could the clay, whether hard, stiff, or soft, that came up in lumps stay on top of that mud?

A.—The mud did harden out in time, you know. You may say that it would be the sun, but the mud hardens out like bricks.

Q.—If you spread it out in the sun?

A.—Yes, in the sun.

Q.—I can imagine that, but this was all under water?

A.—Yes.

Q.—It could never harden out unless you exposed it to the sun. What I want to know is how possibly could the clay float on that mud?

A.—If you put it in that way I see the difficulty.

Q.—I could not understand it, because I do not see how clay cut out in pieces, as it would be by that cutter, could ever stay on top of that mud. That material, after it had been churned by two centrifugal pumps and then deposited into water, escaped through the rubble mound. Of course it escaped. There was nothing to stop it escaping?

A.—There was nothing to stop it escaping.

Q.—It was bound to escape?

A.—Yes.

Q.—And I gathered from both Mr. Brims and Sir Lawless Hepper that you apparently did not wish to retain it as you thought it was not worth retaining. A very large quantity escaped in the first two seasons dredging?

A.—Yes.

Sir M. Visvesvaraya.—900,000 cubic yards.

Sir Frederick Hopkinson.—I do not think it was as much as that. It was 45 per cent. of the output.

Chairman.—It was 45 per cent. in one year and 55 per cent. in the other year.

Sir Frederick Hopkinson.—That would be nearly a million yards in two seasons. That was half the season's work.

A.—In point of fact a great deal of that mud has dried out and has made good land.

Q.—On the other hand a great deal of it has escaped.

A.—A great deal of it has escaped.

Chairman.—Taking the two years it is 50 per cent. It is 45 per cent. in one year. and 55 per cent. in the other.

Sir M. Visvesvaraya.—How many cubic yards is that?

Sir Frederick Hopkinson.—That is roughly one million cubic yards.

Sir M. Visvesvaraya.—It is nine lakhs of cubic yards.

Sir Frederick Hopkinson.—It is 900,000 cubic yards. That in two seasons is one-twenty-fifth of the whole dredging operations, but they told us quite definitely that you did not apparently wish to retain this, and you took no steps to retain it?

A.—No, that is not correct. When I said it was not worth while retaining there was very little of that material at all.

Q.—But I suggest to you that your first year or two's dredging was almost entirely mud?

A.—No.

Q.—Are you sure?

A.—Quite sure.

Q.—This is a copy of the plan that you sent out to Bombay, and you began operations in block K?

A.—Yes.

Q.—In block K there were 2,281,000 yards of material of which the clay was none?

A.—Yes.

Q.—That is where you began dredging?

A.—Yes.

Q.—In block B there were 1,578,000 yards of mud and no clay. In block J there were 893,000 yards of mud and 646,000 yards of clay?

A.—Yes.

Q.—In block H there were 4,189,000 yards of mud and 300,000 yards of clay. Altogether was about one million yards of clay to 9 million yards of mud?

A.—Yes.

Q.—Therefore I suggest that you could not have had much clay in the first two seasons dredging.

A.—In point of fact there was a considerable amount of clay.

Q.—It is not shown in the borings, is it?

A.—It is not shown in those borings.

Q.—It is not shown in those very complete borings which were made. I do not see how you could possibly have had any clay in the first two seasons unless you went right to the outside edge?

A.—A great deal of that material was really hardening out very well in various parts of the Reclamation.

Q.—But it was all under water. It could not harden out. It was impossible for it to harden?

A.—Were you there in the hot weather?

Q.—I was not there at all in those years. The material was covered by the tide every day, and it was also held in by a bund, and all the water coming into the pipe kept it absolutely wet. It was never exposed to the sun: it was always covered with water.

A.—It was always covered with water?

Q.—Yes?

A.—Mr. Settle, who is giving evidence, went very particularly into the question of material. He was there much later than I was, and I should like you to ask him.

Q.—We shall be glad to have any information that we can get, and I hope that he hears the questions so that he can carefully consider them and give us the proper answers. Do you remember that in your estimate of September, 1919, you provided for backing up the sea wall with moorum?

A.—No.

Q.—If you will look at your original report I think that you did?

A.—Yes.

Q.—Why was not that put in?

A.—It is not very much, is it?

Q.—It is not very much I agree; it is not nearly enough. It is item No. 8 on page 29. In your comparative estimate on page 13 you mix the two up together. You call it moorum backing and topping 1,919,000 yards?

A.—Yes.

Q.—The general quantity for one foot of moorum I think was 1,860,000 yards, was it not?

A.—There have been various numbers, yes.

Q.—I think it only varied between that and double that quantity?

A.—Yes.

Q.—That leaves about 59,000 yards for moorum backing?

A.—Yes.

Q.—That would not be enough to back up the wall, would it?

A.—That would not be enough to back up the whole of the wall.

Q.—No?

A.—It was what we considered necessary in this preliminary estimate.

Q.—Wherever you were pumping mud it was necessary, was it not, because that mud churned up by two pumps would flow wherever water would flow, and as the tide went out it was bound to go out with it?

A.—As you probably noticed, in one of my reports I say it might be necessary to make settling ponds.

Q.—Yes, and that is what was done under Sir Lawless Hepper's orders?
A.—Yes.

Q.—Then in November, 1925, your firm wrote out to say that the necessity for doing this appeared to be indicated?
A.—Yes.

Q.—That was two years after the dredging had begun, and nearly a year after the wall had been closed with moorum?
A.—Yes.

Q.—Why did they say that? Can you give me any idea? It was eighteen months after it was first suggested. It took eighteen months for somebody in your office to find out that it was indicated and that it might be necessary?
A.—Yes. Mr. Halcrow can give evidence on that very point.

Q.—Put yourself in the position of the man in charge out in Bombay, what do you think he would think of an engineer in London writing such a letter as that in October, 1925. Do you think he would have any respect for him?
A.—I cannot reply to the question. I think that you would require to know all the circumstances.

Q.—The circumstances are very simple.
A.—They are not so simple.

Q.—They are quite simple?
A.—No.

Q.—Here you were pumping material into a lagoon which was escaping through a wall that you had built. You could not have anything simpler. The question is to put a cork in the hole and stop it?
A.—I do not agree with you in your remark as to what the engineers would think about the engineer at home.

Q.—I will tell you frankly that I know what I should think?
A.—You must remember that we were in the extraordinary position of having a representative who was not a representative. You know perfectly well that if work had been undertaken by contract, and we had had a resident engineer in the ordinary course of things looking after their interests many things would have been done differently.

Q.—I hope so any way.
A.—We had a resident engineer who was not—well, I need not say any more. He broke down absolutely.

Q.—As you have mentioned the subject I will refer to it here. Do you really think that Mr. Lewis was ever, whatever his health was, capable of tackling a job of that magnitude? Was his past experience such as to warrant his ever being appointed to take charge of that work?

Chairman.—Had he the energy and drive to do it?

Sir Frederick Hopkinson.—I will ask that question later. Had he the necessary experience, first of all?
A.—Yes, I think he had the necessary experience.

Sir Frederick Hopkinson.—I have asked Mr. Lewis very complete questions about the whole of his career, and it does not appear to me that anybody could, under any circumstances, have been warranted in placing him in charge of such a large and important work.

Chairman.—Sir George, do tell us anything you can about this, because this is a matter in which I think we feel a good deal of seriousness—the appointment of Mr. Lewis. We have seen Mr. Lewis here.
A.—I am sorry you did not see him in a condition of good health. Originally I had another officer under contemplation. He failed me. The Governor said: "We must start work." I searched round. It was very difficult indeed to get men at that time.

Sir Frederick Hopkinson.—Nobody knows that better than I do.
A.—I nominated Mr. Lewis, and naturally I should not have nominated him unless I thought he was up to the job. He had done most extraordinarily good work with me in Burma, opening out large quarries, which was what we wanted him for first of all.

Q.—In Burma?
A.—Yes.

Q.—What was that work?
A.—The River Training works.

Q.—Do you mean Rangoon?

A.—Rangoon. He had entire charge of the quarries. They were large quarries. I think we had 1,000 tons a day.

Q.—That was only an offshoot of the thing in Bombay. In Rangoon he said all he had to do was to look after that quarry.

A.—I think he had more than that to do. He had quite a distinguished record.

Sir M. Visvesvaraya.—He was quite a different man when I met him in Bombay, Sir Frederick.

Sir Frederick Hopkinson.—I am not saying anything about his physical capacity. I am speaking of his experience of large works. With the exception of Rangoon, which appears to be only working a quarry, I do not remember any experience which he gave us which was of any size at all.

A.—In point of fact, he had rather a distinguished record in the Public Works Department. When I nominated him for this position he was chief engineer to the whole of the province of Burma. You cannot be chief engineer to the whole of the province of Burma without some experience.

Q.—That is not quite my point. My point is experience of, and managing, a large work of this kind?

A.—He had had practical experience. I cannot remember the whole of his record. Have you seen all his record, chapter and verse?

Q.— We have got it.

A.—Or have you only got what he has said here?

Q.—I asked him complete questions about it, and he never seemed to have been in any position for more than a few months, and they were all comparatively small works. I suggest to you that, for properly carrying on this work, you ought to have had the best man obtainable in the world, because there are very diverse propositions in it. You agree with that?

A.—I agree with that.

Q.—And it would probably have paid you over and over again if you had given £10,000 a year to the man who was best capable of doing it?

A.—Excuse me, it was for the Government of Bombay to say what they would give?

Q.—No, I do not think I can agree with you there. I think you were in the position at that time of adviser to the Government of Bombay, and it was for you to say to them what they ought to do. Who is there in the Government of Bombay who can decide on the capacity of a man for carrying out a work of this kind? Is there anybody?

A.—It is not a matter of the Government of Bombay. It goes to the Government of India.

Q.—Go to the Government of India if you like.

A.—However, I can assure you, Sir Frederick, that you would not have had the very slightest chance of getting a man at—I will not say £20,000 a year.

Q.—£20,000 is rather a large sum?

A.—Say £5,000 a year. I do not want to say anything against Mr. Lewis. I know him much better than you do.

Q.—Quite; I understand your feelings.

A.—He has great powers of organisation. You saw a wreck. You did not see the real man.

Q.—I am not saying anything against Mr. Lewis personally.

A.—When I proposed a salary for him—I forget what the exact salary was?

Q.—Rs. 3,000 a month.

A.—It was objected to. It had to go home to the Secretary of State for sanction, and then it was objected to, and at the last moment I had to write to Sir George Lloyd and say, " I do not know what we are going to do; I have got this one man, and the Secretary of State has refused to sanction him at Rs. 3,000 a month."

Q.—At certain times we all know quite well that Governments are always penny wise and pound foolish, are they not?

A.—I agree.

Q.—In other words, if you want a good thing you have to pay for it?

A.—Yes.

Q.—To go to another subject, you said it was cheaper to begin the sea wall from the Marine Lines end. I wish you would tell me why you thought that?

A.—For the simple reason that the railway from the quarry led straight on to the Marine Lines work.

Q.—But you only had to extend your railway to the Colaba end, as you did afterwards?

A.—What did the Colaba railway cost—7 lakhs of rupees.

Q.—But you had to do it?

A.—We should not have had to do it if we had gone the whole way from the Marine Lines.

Q.—It was necessary to do it. How are you going to build the first 2,000 feet at the Colaba end?

A.—With regard to the first 2,000 feet, we did get a great deal of stone thereabout, it was concrete.

Q.—But 2,000 feet of wall means very large quantities, and surely you could not economically get that in penny numbers? You want to do the thing properly. In any case, you would have to take the railway there some time in order to take your moorum topping, would you not?

A.—Well, there again, one is going over years. We might have been right or we might have been wrong, but, at all events, we considered it was best to begin at the Marine Lines end.

Q.—I suggest that that was quite wrong. I suggest that the advice that you ought to have given to the Government of Bombay was "At any cost begin work at the Colaba end; finish that Block 8. Then immediately you have finished it (it required no development) hand it over to the Government of India for their military use," and they would pay you two-thirds of your total estimate for doing the entire work, and those two-thirds would have financed your scheme entirely.

A.—Well, it may be so. One can always be wise after the event.

Q.—But is not that rather elementary? The first thing you do when you are thinking of carrying out a large work, is to say to yourself "How am I going to finance this?" You were spending £1,250,000. At 6¼ per cent. that cost you nearly £100,000 a year?

A.—I was not financing it. It was the Director of Development who was financing it.

Q.—You were the adviser to the Government?

A.—I was not an adviser on financial matters.

Q.—But you do not need to be an adviser on financial matters. That is the ordinary business way of doing a thing. Surely the question of 6¼ per cent. interest on £1,250,000 should weigh very largely with you in determining how to do the work, should it not?

A.—However, take it as you like. We decided it would be better to start from the Marine Lines because it was near the quarries. The Government asked us to begin at both ends, and you know the events which followed. Whether we were right or whether we were wrong is a matter of opinion. I say one can always be wise after the event.

Q.—The wise man is a man who is always wise before the event, is he not?

A.—Unfortunately they are very rare in this world.

Q.—Do you not find that all successful business men are wise before the event rather than afterwards?

A.—I could not say; I do not know.

Q.—It is the men who are unwise before the event who end up in the Bankruptcy Court. I suggest to you that you gave them thoroughly bad advice in advising them to begin at the Marine Lines end, for the reason I have given to you, if for no other. You are spending nearly £100,000 a year in interest—which you are spending to-day, and which you have been spending every day since you have started the work at the Colaba end. I should just like to run through your statement. There are a few points in it which the Chairman has not thoroughly dealt with, from my point of view. First of all I would like to ask you one or two questions about your earliest connection with the work. It would appear that you arrived in Bombay on the 19th May, and you left on the 31st. That gave you about ten working days?

A.—Yes.

Q.—Do you think that anyone could do justice to such a scheme as this in ten days?

A.—I undoubtedly do. I should not have thought of leaving otherwise.

Q.—Did you select a quarry in those ten days?

A.—No. I made enquiries about a quarry, but look at my terms of reference? I was not asked to select a quarry.

Q.—"To examine and report on Mr. Kidd's estimate." How could you do it?

A.—Very well, Sir Frederick Hopkinson. I had the whole of Mr. Kidd's plans and estimates. I obtained the local information I required in Bombay, and I still maintain

(it is a matter of opinion; I have my opinion and you have your opinion) that I had sufficient time for the work. I should not have gone away if I thought I had not got all the information.

Q.—I do not personally see how you could possibly make up an estimate for doing the work unless you had settled where the quarry was to be. You did not know how far it was going to be away. You did not know what the railway rate was going to be. You did not know how much it would cost to open it up. You did not know what length of roads you would require.

A.—I think we are confusing issues, Sir Frederick. I was not making out a working estimate then at all. I got my information as to what the ordinary price of stone was, but I was not going into the details of a quarry.

Q.—But the price of stone depends upon the conditions, does it not? I saw some prices in your list of estimates which you gave me yesterday. It might have been in cart loads. You had to start an entirely new and large scheme. I do not see how you could possibly fix a price for your sea wall unless you knew where the stone was coming from and what it was going to cost you?

A.—Did you ever know the late Mr. C. S. Meik?

Q.—Quite well.

A.—Do you think he would have assisted in preparing an estimate that was not safe about the prices?

Q.—I never knew him in any estimating capacity, so I could not possibly say, but I do not see how Mr. Meik, in London, could possibly know what it was going to cost in Bombay. It was for you to do, really, was it not, and not Mr. Meik? You had been on the site. At any rate, I suggest that ten days was an utterly disproportionate time to allow for the approval of such a scheme as that.

A.—I wish it to be put on record that that is a matter of opinion, and that I dissent —that I consider that I had ample time.

Sir Frederick Hopkinson.—I do not think I need say anything more about Mr. Kidd's estimate. You have done that pretty thoroughly, I think, Mr. Chairman? As to your original appointment, Sir George, Lord Lloyd told us the other day that he had not previously known you. Is that so?

Chairman.—He had met you for a few moments in Mesopotamia, just socially?

A.—Well, we had a long talk of perhaps an hour or two in Mesopotamia.

Sir Frederick Hopkinson.—But not about technical matters, I presume? It would appear that your appointment to undertake this work depended upon the fact that you happened to be in India at that particular time?

A.—That is for you to say.

Q.—Lord Lloyd had been telegraphing home to know if they could send an expert out, and because they said they could not send one out before October he decided to use your services. Is not that it?

A.—With the consent of the Government of India.

Q.—So I say it depended upon the fact that you happened to be out there at that particular time?

A.—That is one way of putting it.

Chairman.—Lord Lloyd also said that your selection was fairly obvious.

Sir Frederick Hopkinson.—On Page 32 of your report, the 6th line from the top, you say "We recognised at once that the crux of the scheme lay in the efficiency of the dredging plant and success of the dredging operations, and on these matters we concentrated our attention. We had both had great practical experience with dredgers of all types and in dredging." As you recognised that the crux of the scheme lay in the efficiency of the dredging plant, you would, of course, take exceptional means to satisfy yourselves that the plant you proposed would be suitable for the work?

A.—Yes.

Q.—Broadly, without going into any details, the machines you have supplied have done half of what you estimated they would do?

A.—Yes.

Q.—You mention further down on the same page about the Rangoon river training scheme. There was a lot of dredging there, was there not?

A.—There was.

Q.—Can you tell me at what cost?

A.—No, I cannot.

Q.—I will tell you then. It cost 1s. 6d. a cubic yard.

A.—I have not the figures before me, but I told the Chairman that in all these matters the circumstances surrounding had to be considered.

Q.—The material at Rangoon was light sand—ideal dredging material, much easier to do than that of Bombay, I think, was it not?

A.—It was silt and sand.

Q.—In fact material for which suction dredgers were first invented to deal with?

A.—Yes.

Q.—The cost I have taken from a paper read by you at the Institution of Civil Engineers. I want to know how, with that record so near you, you could ever conceive of doing this work for eight annas per cubic yard?

A.—It is not a question I can possibly answer without reference to the paper quoted.

Q.—Did not that price influence you in fixing your price of eight annas?

A.—I cannot answer any of these questions by question and answer. I cannot go over what happened in Rangoon in 1912 without referring to my figures.

Chairman.—You can tell us this, Sir George. You must have had in your mind, when you were drafting the report of 1919, that Rangoon had cost 1s. 6d. a cubic yard, must you not? You would carry that in your mind?

A.—Possibly.

Q.—Certainly. A material matter like that would not pass out of your mind?

A.—No.

Q.—You must also have had it in mind that it was silt and sand—the material on which you were working in Rangoon?

A.—Yes.

Q.—Did it never occur to you, when you were drafting your report and knew you were going into a material of silt and blue clay, to consider whether you would do better in silt and blue clay than in silt and sand? Silt and sand is an easier operation than silt and blue clay, is it not?

A.—Yes.

Q.—If it cost you 1s. 6d. to do silt and sand, presumably it would cost you more than 1s. 6d. to do silt and blue clay. Did that point of view ever occur to you?

A.—It may have occurred to me, but one must consider all the circumstances. I cannot answer questions of this character.

Sir Frederick Hopkinson.—The circumstances at Bombay were so different that you required two dredgers to do the same work, and therefore your cost would be very nearly double, would it not?

A.—Yes.

Q.—You had only one at Rangoon, and if I remember rightly, the horse power of your dredger at Rangoon was about 3700. Moreover it was a double stage pump; that is, there were two pumps on the one boat?

A.—Yes.

Q.—That is a much more efficient tool, is it not, than a single pump?

A.—I am not prepared to answer any of these questions.

Q.—That is an ordinary matter of ordinary technical knowledge?

A.—No.

Q.—You claim to be an expert in dredging?

A.—Rangoon has gone out of my knowledge.

Q.—Leave Rangoon alone. You claim to be an expert in dredging. Is not a double stage pump far superior to a single stage pump?

A.—Of course it is.

Q.—That is the point. Then why did you put a single stage pump at Bombay?

A.—Why did I put a single stage pump at Bombay?

Q.—Yes, a single stage pump on each boat?

A.—That I certainly cannot answer by question and answer.

Q.—The "Sir George Lloyd" and the "Colaba" each had one pump, but the "Pelican" at Rangoon had two pumps, double stage?

A.—Yes.

Q.—You say it is a much more efficient tool, and I entirely agree with you, and yet you put a single stage pump into the Bombay machines?

A.—I am not prepared to answer that question. We did not design the dredger in Rangoon and we did not design the dredger for Bombay.

Q.—But you gave the specification for the dredger at Bombay?

A.—We gave a skeleton specification. We did not say what the pump was to be.

Q.—Then what is your specification worth, because that is the heart of the machine?

A.—We asked the builders to specify the best for the work.

Q.—Then you did not make the specification. The builders did it?
A.—The builders did the specification.

Q.—You have claimed hitherto that you drew up the specification for the pump for the " Sir George Lloyd "?
A.—No, I have never claimed that.

Sir Frederick Hopkinson.—I think you have—jointly with Sir John Biles. It appears in your statement.

Chairman.—The witness referred to a letter of September 12th. You are referring to the letter of September 12th of Simons & Co., are you not, in which Simons gave you a general specification with certain modifications after discussion between Sir John Biles and yourself which formed the basis of the contract?
A.—Yes.

Q.—The letter of September 12th, 1919, is the first document in which anything like a general description of the vessels is given?
A.—That is correct.

Q.—And that was drawn up by Messrs. Simons & Co.?
A.—That is right.

Sir Frederick Hopkinson.—But we have been told that you made the preliminary specification for that dredger. You would tell Messrs. Simons before that, would you not, what they had to provide for? Did you not say it must pump 2,000 yards an hour?
A.—Yes.

Q.—Did you not give them the length of the pipe?
A.—Yes.

Q.—Did you not give them the height to which they were to pump?
A.—Yes.

Q.—That is all you gave them?
A.—That is all we gave them.

Q.—And for that you received 1 per cent.?
A.—I beg your pardon.

Q.—For that you received 1 per cent. of its cost?
A.—We have not received one per cent. of the cost.

Q.—You have hopes I expect?
A.—No, I have not.

Chairman.—You have received ¾ per cent.

Sir Frederick Hopkinson.—And the other is owing.

Chairman.—Also, Sir George, you had various consultations with Sir John Biles and other people, apart from these one or two interviews with Simons before July, 1925?
A.—Yes. Put it in this way. We were to get so much on the whole work. Very well then. There was a discussion as to how that was to be arrived at, and it was decided that we should have so much of the dredger as part of the whole work, and Sir John Biles drew up the specification. I think he showed it to us. I do not know when, but we considered he was responsible for the specification.

Sir Frederick Hopkinson.—What I am trying to find out is who is actually responsible for the original specification for the dredger, and why the dredger was built with a single pump.
A.—The reply to that is that the original specification was drawn up by Messrs. Simons & Co. in the usual way.

Q.—Then they practically dictated what kind of a dredger you were to have?
A.—Yes.

Q.—And the dredger they specified was almost a copy of the " Kalu " and " Jinga " in all the essentials?
A.—In all the essentials.

Q.—It was a little bit bigger?
A.—Yes.

Q.—And had a little bit more power?
A.—Yes.

Q.—One was 2,700 h.p. and the other was 3,000 h.p.?
A.—Something like that.

Q.—One had to dredge a shorter distance than the other, and a lower elevation, but in essentials they were copies. Now we know as a matter of fact that both the " Kalu " and the " Jinga " were failures at Sewri. Together they did a little more thar 50 per cent. of what they were designed to do?
A.—We have already discussed that very considerably with the Chairman.

Q.—I know, but I wish to emphasise the point that although you know a double stage pump was more efficient than a single stage pump, you allowed them to specify a single stage pump?

A.—Yes, and if I may justify that I will do so in a separate communication.*

Sir Frederick Hopkinson.—We shall be only too glad, Sir George.

Chairman.—Just make a note of that will you, Sir George?

Sir Frederick Hopkinson.—Do you remember in this connection that the dredger specified by Lobnitz & Co. for doing the Bombay work was a double stage pump?

A.—No, I do not remember.

Q.—Well, it was. If this large and important scheme was almost entirely a question of the dredging, do you not think it would have been fair to the dredger builders to have made certain that they had a sample of the material—the clay—which they had to dredge in order that they might design a dredger best capable of dealing with that material?

A.—No, I do not admit that.

Q.—What do you think was the proper way of asking them to design a dredger? Surely you must give them some indication of what the machine is to do?

A.—We are getting back to the old question of stiff clay and unctuous clay and soft clay.

Q.—I am taking it in rather a general way. I am suggesting that, both for your own protection and for the protection of the dredger builders, they ought to have been given a sample of the exact material with which the machine they had to design had to deal. Do you not think that would have been the proper thing to do?

A.—All I can say is that I have never done such a thing, and I do not know of any case where it has been done.

Q.—I advisedly put in the words " for their own protection " because you see the position now. It has been advertised to the world that this dredger has not been successful. That is bound to reflect in some way upon the dredger builders, is it not?

A.—Well, it has been advertised to the world that the dredger is not successful, but there will also be presumably advertised to the world the other side of the question—that the dredger has not been worked properly.

Q.—We will deal with that in more detail when I come to dredging. I am only trying to clear up a few points in this volume. There is one thing which I do not quite understand here. At the top of Page 37 you say " I modified and very considerably cheapened a section of the wall proposed by Mr. Kidd for reasons given in my report "?

A.—Yes.

Q.—Would you mind explaining to me how that can be, when Mr. Kidd's wall was going to be built for 64 lakhs and yours was to cost 118?

A.—That is very obvious.

Q.—It may be to you, but it is not to me, and I hope you will make it so.

A.—This is all I have to say on the subject. Mr. Kidd's estimate of 1912—sea wall, 64·22 lakhs. My estimate at the same time of Mr. Kidd's plans, 56. My estimate for a sea wall—which, as I say, was cheaper than Mr. Kidd's sea wall, in 1919, which is seven years later, 118·7.

Q.—Twice as much as Mr. Kidd's?

A.—Yes.

Q.—I do not quite see how you very considerably cheapened it?

A.—If I had Mr. Kidd's plans here I could show you, but really I cannot show you without Mr. Kidd's plans.

Q.—Well, I have not got them. Now if you will turn to Page 38, you give the order in which you suggested the work should be done: No. 1, order dredging plant; No. 2, order railway tipping wagons; No. 3, open up quarries for stone and murum; No. 4, begin building wall from Colaba end?

A.—Yes.

Q.—There is not a word there about beginning from Marine Lines, is there?

A.—No, not a word.

Q.—Is that because the Government instructed you afterwards to begin from Marine Lines?

A.—No. It was because at a later date we considered that transport conditions would be easier at Marine Lines.

Q.—I suggest to you that that order is quite wrong; that you ought to have been ready for the dredgers before they arrived there. Your dredger, when you let the contract, was promised to be finished in 14 months?

A.—Yes.

Q.—Probably if you had gone to a little expense and paid for a little overtime you could have got it done in ten or eleven months, or even twelve. Allow two months

* See Appendix XVI.

for the voyage out there. That meant 14 months. Was it possible for you, from May, 1920, to be ready to start dredging in July, 1921? Could it ever have been possible?

A.—It was hoped to be possible.

Q.—I want to go further than that. I want to know, could it by any possibility have been ready, because you did not order your plant till about October, 1920, and the bulk of it was not delivered until 1922. How could you have been ready for the dredger in July, 1921? You have got to order your plant, get it out there, open up your quarries, lay all your railways in, get your plant erected, build your sea wall, build your cross wall, and be ready for the dredger to start, and the storm water drain if necessary—and which was necessary in Block 8. I suggest that the order is entirely wrong and that you ought to have held your hand about the dredger?

A.—Dredgers sometimes sink, and then you have to order another one.

Q.—It is insured, is it not, so you do not lose anything except time; but you surely did not lay down this order of doing the work on the presumption that the dredger was going to sink? Surely that would not have influenced you?

A.—I wish to point out, Mr. Chairman, that these are all expressions of opinion. Sir Frederick Hopkinson can have his opinion: I can have my opinion. I have no doubt that we could both call in experts who would also express opinions. I am willing to leave it at that. If Sir Frederick Hopkinson differs from me, naturally he will put down that he differs from me, and we will agree to differ.

Chairman.—That is right. As long as you give your explanation in answer to Sir Frederick's question, we shall then know just where we stand.

A.—I do not accept always what he says. I say that this is a matter on which we could both of us bring experts to consider and decide.

Sir Frederick Hopkinson.—It meant that you would have to order your plant in October, 1920, get it delivered in Bombay and erected, and have your quarries opened, and be all ready in eight months. Do you consider that a feasible thing?

A.—Not in eight months.

Q.—Yes, in eight months—from October, 1920 to July, 1921, nine months. We need not go on opinions at all. Going on the facts, when did your plant get out there for opening up the quarry? It was towards the end of 1922.

A.—You forget, Sir Frederick, that that was on the assumption that a contract was going to be let in Bombay in October, 1920, and the work was going to be taken in hand at once.

Q.—You mean the first piece of wall at the Colaba end?

A.—Yes.

Q.—You were going to do 700,000 yards of dredging in 17 days? That was only providing for 17 days' work for the dredger. There are 2,000 feet of wall at the Colaba end?

A.—Oh, no; we had hoped to do more than that.

Q.—But that is what you say now—that this was on the assumption that you were going to get 2,000 feet of wall built by contract? Now, on page 39 you say: "The Development Directorate had not been created, and I understood my firm would be in sole charge and control, and that our resident engineer would be free from the numerous restrictions," and so on?

A.—Yes.

Q.—I am only pointing this out in order that your Counsel may consider this as one of the points. What correspondence has ever taken place since that has altered the impression you had at that time that you were to be in sole charge and control? It is control, if you observe, not supervisory control, but control.

A.—At that date we had no agreement. We had not been appointed engineers to the work. At that date no Development Directorate had been created. I do not see that the matter applies; but that is a matter my Counsel will deal with.

Q.—I hope he will; but that is what you had in your mind at that time: that you were to be in sole charge and control. That meant in executive control, did it not?

A.—At that time I supposed the staff of engineers would be appointed independently of the Development Directorate.

Q.—But you were put in sole charge and control?

A.—I was not in sole charge and control.

Q.—My question was: What has taken place since that has altered the view that you expressed there?

A.—Well, many things have happened. However, that I prefer to leave over. It must be common sense that one cannot be in charge and control if actually all power is elsewhere.

Q.—I entirely agree. If you are going to be in sole charge and control you must have both powers?

A.—Yes.

Q.—Otherwise you cannot remain in full charge and control?

A.—No.

Q.—The delay I am causing is entirely to be attributed to the Chairman. He has taken so much of the wind out of my sails that I have to find what he has not touched upon. There is one point I would like to emphasise a little on page 50, where you say :" I had agreed on behalf of my firm, and had promised to make the carrying out of the work my principal object; if necessary, to decline works elsewhere, and I had agreed to go out and spend several months every winter in Bombay." I should like to contrast that with the year 1925, when you left Bombay on the 7th January and did not return again. You went out of touch with the works?

A.—What time did I arrive in Bombay in that year?

Chairman.—The 24th November, 1924.

A.—I think it was October.

Chairman.—Yes; it was October, 1924.

Sir Frederick Hopkinson.—That is about two and a-half months?

A.—Yes.

Q.—As you yourself have said, questions were always arising, and you were not in a position to deal with any questions which arose after 7th January, which was the bulk of the working season—from then on to May or June?

A.—They were most admirably dealt with in my office.

Q.—Possibly; but the point I am trying to make is that you had made this your personal care, not your office, and sometimes there is a good deal of difference in that.

A.—It is curious they were always so very pleased to say good-bye to me in Bombay, is it not, and they never asked me to remain?

Q.—It is not very flattering?

A.—It is in one way.

Q.—I should like them to say good-bye to me with regrets.

A.—Yes.

Q.—Then on page 53 : " I also said I was not aware of any other case where the execution of the work had been specially confined to the personal attention of one particular member of a firm."

A.—Yes.

Q.—That is another thing?

A.—Yes.

Q.—Then three lines further on you say : " But the one of my personal attention was retained." I am simply emphasising what Lord Lloyd said to you in 1919 : that he trusted you entirely not to let him down.

A.—Yes.

Q.—There is one point I want to mention about costs. I have read all the correspondence about the costs that took place between the Director of Development and the Government. That was a case where the Government showed very great stupidity in resisting the appointment of a proper staff to keep costs; but the point I want to make is this : You agree you were in general supervision of the works. Is not that so?

A.—Supervision of the permanent works—advisory.

Q.—I mean permanent works.

A.—Yes.

Q.—I want to suggest to you it was not possible for you or anybody else properly to supervise the works unless you knew the costs.

A.—I quite agree.

Q.—It is an essential factor in the management and supervision of works, is it not?

A.—Absolutely essential.

Q.—And that not knowing these costs you could not possibly supervise them properly?

A.—I agree. You perhaps understand the procedure in India with public works, which is that they do not keep detailed costs.

Q.—I should think that is probably a very serious blot upon their control of works.

A.—I have always thought so.

Q.—I entirely agree with you.

A.—A project estimate is prepared and sanctioned. The estimate has so many heads. The only concern of the auditors is that nobody steals a rupee, and that the sanctioned estimate under the various heads is not exceeded; regardless of the fact

that by keeping costs properly and exercising economy expenditure can be very much reduced.

Q.—Keeping costs enables you to exercise economy?

A.—Keeping costs enables you to exercise economy, but the fact that the cost of public works might thereby be very much reduced does not come within the purview of the audit.

Q.—Then you come to the question of who makes these project estimates. It seems to me rather a comic-opera performance, because the man who makes the project estimate is the man who is going to carry out the work.

A.—That is true.

Q.—Therefore, he would be more than human if he cut his prices down.

A.—Exactly; I agree.

Q.—If he cut his prices down and the work cost a little more than his estimate showed, he would get into serious trouble?

A.—He would.

Q.—If he put his prices twice as much as he need and he did it for three-quarters, he would be considered more or less a reliable man?

A.—I quite agree.

Q.—Although the work might have cost 50 per cent. more than it ought to have cost?

A.—Yes.

Sir Frederick Hopkinson.—I am glad we agree on something.

Mr. Billimoria.—It is lamentable that in spite of the project estimate being excessive we have not been able to do anything even within the project estimate, as far as this scheme is concerned.

Sir Frederick Hopkinson.—We are only keeping within the one principle at the moment.

Mr. Billimoria.—The 702 lakhs estimate has been far exceeded.

Sir Frederick Hopkinson.—I should not like to be led into making any remarks about the efficiency of the audit in your presence, Mr. Billimoria. Then you complain here, and very rightly complain: "At no stage were we informed what the work was costing." My suggestion is that you could not possibly, without that information, supervise the works.

A.—We are in agreement.

Q.—Therefore I should go a step further and say: Why did you not insist upon having the costings? Why did you not write to the Governor-General and say: "If you do not do this I cannot possibly supervise the works. I cannot carry out my contract with you properly to supervise the works unless you help me"? It would be a quite sufficient reason for a threat of resignation, I think. Do you not think so?

A.—I think we discussed this this morning:

Chairman.—Is it not quicker to say yes or no whether, in those circumstances, you ought not to have made strong representations right up to the Governor and direct even to the Government of India? That is Sir Frederick Hopkinson's point.

A.—It went to the Government of India.

Q.—It went by easy stages to the Government of India. It is the same point that Sir M. Visvesvaraya was putting: that direct personal representations by you would have much more effect than sending a letter to Mr. Lewis which, in the ordinary routine, eventually finds its way to Simla.

A.—I do not agree, because Government does not understand what costing accounts are. They looked upon my proposals with surprise. They said: "We do not understand this. What is this about cost accounts?"

Sir Frederick Hopkinson.—Then is not it your duty to make them understand, and tell them you cannot possibly carry out your contract unless you have these? I should have thought it would be. You say on page 64 that you sent out Mr. Settle to report on the dredging, to criticise the execution of the works, and make a thorough inspection of the works?

A.—Yes.

Q.—Did he make a report?

A.—He did make a report.

Q.—To whom?

A.—To us.

Q.—What action was taken on it?

A.—By that time we had ceased to have any connection with the works.

Q.—On page 70 you speak about savings on the estimates other than those connected with dredging as amounting to something like 35 lakhs of rupees. I suggest to you that was entirely due to the alteration in design, and to the omission of the concrete blocks; so there is no particular credit attaching to anybody about that.

A.—The omission of the concrete blocks is a saving, is it not?

Q.—Yes; but it is a saving in the cost.

A.—I do not for a moment say that the saving was in execution.

Q.—I see. It was an omission. It was something which you did not find necessary?

A.—Yes.

Q.—So you very properly omitted them. Then you say on page 82 that the chief engineer, for all reclamation schemes, was under the direct orders of the Director of Development: "But as far as the Back Bay scheme was concerned he also had duties to my firm." Was not he almost entirely responsible to you, to advise you as to what went on in your absence?

A.—Well, really he was supposed to carry out the duties of a resident engineer.

Q.—Normally, if a man did not carry out his duties you would dispense with his services?

A.—Certainly.

Q.—There is one thing which rather struck me which occurred in the middle of 1923. You are complaining that Mr. Lewis is too old for the job. He had only been appointed in 1920. Surely you would have known in 1920 that he was going to be too old in three years, and you would not have appointed him to a job which was going to last six or eight years?

A.—Well, a man may be old and fit for his work, and a man may break down suddenly. I do not think you can labour that point.

Q.—It does not say anything about breakdown. You say: "He is still either suffering from bad health or he is too old for the job." If he was too old in 1923, of course he is too old to appoint in 1920?

A.—Yes—well, I do not think you need labour that point.

Q.—I do not wish to. Having regard to what took place out there I should like to ask you one question, which is this. Why, when this dredging was dragging its weary length along in 1923-24, and 1924-25, did you not say to yourself: "I am going out to Bombay for, if necessary, the whole 171 working days, and so put it right"? Do not you think it was your obvious course to pursue? After all, you are the chief engineer for the whole scheme. If the scheme fails it is bound to reflect upon you, is it not, whatever the reason? Did it not ever occur to you to do as I suggest?

A.—I do not think it ever occurred to me to do specifically what you suggest; but Mr. Lewis went on the 12th July, 1924. As I have pointed out, I consider that his retention after his first breakdown was of the very greatest possible harm.

Q.—Was not that an additional reason for you to go out there and pull things round?

A.—No, because he was the man in control of the carrying out of the work—I was not the executive—and if he chose to refuse to give me any information, I was powerless.

Q.—I am looking at it from rather a larger point of view, and that is this: did you not feel you ought in honour bound to go out and pull the thing together and make a success of it?

A.—Nothing is easier than to come to these conclusions sitting round this table; but if you had been in my shoes, I do not think you would have taken any different course.

Q.—I remember once I had some dredging work abroad, and the dredger was not doing what it had been designed to do. It could not do it. I remember going on board one morning and saying: "I am not going to leave this ship until I find out the reason for it." I was there continuously for 48 hours until I did find it out. That is the sort of thing I mean.

A.—Yes; but you presumably were in control.

Q.—Absolutely.

A.—Well—I was not.

Q.—But you could go and take control?

A.—No, I could not. I disagree there.

Chairman.—I should like to know who would have defied you. If you had gone and said to Lewis: "The whole job is going to pieces, I am going to step in and I am going aboard that dredger, and I am going to see what is the matter," who would have disputed your authority? You would have said: "I am here as expert Engineer, Adviser and assistant to Government and I am supervising. 'Supervising' means watching over, and I am going to watch over this work, and I am going to see it start." Who would have defied you then?

A.—Everybody.

Q.—Mention any one of them?
A.—The Director of Development.

Q.—The Director of Development?
A.—Yes.

Sir Frederick Hopkinson.—He was equally interested in pushing the work on, surely?
A.—I say it would have been an unheard of procedure.

Chairman.—If the Director of Development had defied you, it would have taken you exactly eight minutes to get to Government House and to have laid the whole of your case before the Governor. I do feel puzzled about this. I feel that you were in a commanding position, at all events in a position in which, if you had taken command, everybody would have done as you told them. If they did not, your reference was to the Governor, and if the Governor raised technical difficulties about how you were described, the next steamer was your place home, and a public exposure of the way in which the work had been done.

A.—Well, in drawing repeated attention to the necessity for making a change when Mr. Lewis's health broke down, we considered that we were doing all that we could.

Sir Frederick Hopkinson.—When did you decide to abandon the use of the 20-ton blocks?

A.—At a comparatively early date.

Q.—Why did you not decide that before you brought the 20-ton crane fixing them?

A.—I do not remember that we did buy a 20-ton crane.

Q.—Yes, you did. It is there; I have seen it.
A.—But it was bought by Mr. Lewis.

Q.—Not by you?
A.—No.

Chairman.—You mean it was bought by Mr. Lewis at the time when he was in your office?

A.—We did not buy any of the plant; we did not recommend what plant was wanted.

Sir Frederick Hopkinson.—I will use the term you requisitioned it, and you forwarded it to the Director of Contracts to buy.

A.—It was not on our initiative. We did not buy any of that plant on our initiative. Mr. Lewis came home.

Chairman.—Let us get it correct on the facts. Mr. Lewis came to your office, arriving some time in July, 1920?

A.—Yes.

Q.—He was there from August and onwards?
A.—Yes.

Q.—You left 25th August, 1920?
A.—Yes.

Q.—He was assisted by Mr. Meik in the preparation of the plant list?
A.—Yes.

Q.—Amongst items he ordered was a 20-ton crane, which at this moment I suppose is still standing on the sea-wall?

A.—Yes.

Q.—The evidence is that that 20-ton crane was designed to lift and swing out pell-mell 20-ton blocks as a protection from the sea?
A.—Yes.

Q.—You or your firm altered the design, and came to the conclusion that the stone which was being got at Kandivli was sufficient in weight. It is said in the evidence that that crane has never done more than 7-ton blocks, and that very rarely; and that its usual work is on 3-ton and 4-ton blocks?
A.—Yes.

Q.—And to that extent that there has been a waste of money. That is the point.
A.—Mr. Lewis had sole responsibility for the whole of that plant.

Sir Frederick Hopkinson.—That does not agree with what Mr. Lewis says.
A.—I think Mr. Lewis said that he indented on his own.

Q.—No. He said that Mr. Meik and he together got this out. He went so far as to say that Mr. Meik had been advised by a contractor in London not to put up a

gantry as it was unnecessary, but Mr. Meik thought it was a desirable or convenient way of doing the work.

A.—Yes.

Q.—So that Mr. Meik apparently settled all these things in conjunction with Mr. Lewis?

A.—In conjunction with Mr. Lewis.

Q.—I cannot imagine Mr. Lewis designing and settling what plant was required there, because he had no experience behind him that would warrant it?

A.—He had a particular experience in quarry work.

Q.—In small works?

A.—Well, it was a very large quarry. He went home armed with a list of materials he wanted for the quarry.

Q.—But you know as well as I do that the question of managing a quarry is a thing that we generally leave to a foreman, with occasional supervision. You do not want a highly qualified engineer to work a quarry. I have had dozens of them. I have never had an engineer in a quarry in my life.

A.—Yes, I quite appreciate that view.

Q.—There is no experience to be got in a quarry after a couple of days. Then you know pretty well all about it. If the design required 20-ton blocks, a crane obviously naturally followed for that size, and it must be supplied?

A.—Yes. My recollection is—I will look it up—that Mr. Meik wrote a note in which he said that he did not want Mr. Lewis to order the 20-ton crane.

Q.—He would want a 20-ton crane for 20-ton blocks, which was the proposal?

A.—He particularly advised against the purchase of a 20-ton crane until it had been ascertained whether 20-ton blocks were required or not.

Q.—Perhaps you will look that up and let us have it?

A.—I will look that up.*

Q.—Thank you, very much. Again, I cannot imagine Mr. Lewis ordering a 20-ton crane in defiance of Mr. Meik's remarks that it was possibly not required. Now here is an extraordinary thing. I am reading on page 105 of your statement, paragraph 6: "We hope that it will be possible to obtain all the moorum required for the Back Bay scheme in the vicinity of the Kandivli quarry and bring it down from time to time, as each section of the reclamation is completed; and we would emphasise the fact that as the deliveries will be spread over five years or probably more, it should be possible by judicious arrangement to transport the moorum without undue interference with the transport of the stone." The quarry at its maximum was laid out for 2,000 tons a day. I do not know if that is a letter of yours or whether it is a letter of Meik and Buchanan's signed by somebody else, but there is the letter. Now the moorum required in order to do that was 3,600 tons a day. The whole of your transport was fully occupied in dealing with 2,000 tons a day. How could you possibly interpose 3,600 tons to be done by the same plant?

A.—Well, I cannot remember the details of that.

Q.—I should say that instead of being a judicious arrangement it would be a supernatural arrangement. I forgot to mention when we were speaking about the reclamation at the Colaba end that Mr. Thomas stated positively that the reason the dredger could not work in the extreme end of the Colaba reclamation was that a certain storm water drain had been overlooked. I believe he meant this one—that drain is 2,500 feet long and 5 or 6 feet in diameter. He said that was the real reason why the dredger could not start at the end of 1922. Do you know if that is correct?

A.—As far as I can recollect it is quite incorrect.

Q.—Mr. Thomas stated it quite positively.

A.—I think that is a sufficient reason. If Mr. Thomas stated a thing positively I should think it probably was incorrect.

Q.—If Mr. Thomas said "Yes," you would say he meant, "No"?

A.—That is so.

Chairman.—Sir George has lost all faith in Mr. Thomas as a result of the record of his borings. That is how we read your mind.

A.—I had.

Q.—Mr. Thomas has stated positively that the dredging could not go on in block 8 because there was a storm-water drain there which had been overlooked. If Mr. Thomas is the authority for that, you say that confirms me in my belief that the storm water drain was ready?

A.—In point of fact there is a note of mine—I must try and find it—in which I discuss that storm water drain and point out that the dredging can be proceeded with.

---

* *See* Appendix XVII.

Sir Frederick Hopkinson.—The dredging was not proceeded with?

A.—The dredging was not proceeded with.

Chairman.—In the absence of that storm water drain or while it was under construction?

A.—Well, I must look that up, if I can. There is also a note of ours to Sir Lawless Hepper in which we say that it is quite evident that Mr. Lewis is so obsessed with the idea of starting dredging at Marine Lines that he refuses to make a beginning at Colaba.

Sir Frederick Hopkinson.—But on that question of borings in Back Bay Sir George said quite positively that the borings were all wrong. It is the first time we have had from any source the suggestion that there is anything wrong with those borings.

Chairman.—I think we might tell Sir George what our information is. When we left Bombay the dredging masters and all the people there were confident that when they went in about this time in November into Back Bay, they would get very good results. That is the impression left on my mind. All the dredging people at Bombay were of opinion—and it can be seen in the evidence—that when they went into Back Bay this year they were going to do very well.

Sir M. Visvesvaraya.—I have that impression.

Sir Frederick Hopkinson.—It was partly on that that this Committee recommended to the Government of Bombay to proceed with this season's work.

Chairman.—It comes as a great surprise to me that the borings of Mr. Thomas are all wrong.

Sir Frederick Hopkinson.—I do not know anything about it.

A.—Mr. Settle has some information on that point.

Chairman.—We must go carefully into that.

A.—Do you say that the dredger was going to be put into the same position?

Q.—Not the " Sir George Lloyd " but the " Kalu."

A.—Yes—that she was going to be put in the same position as she had been in last year?

Q.—Yes.

A.—Mr. Settle will be able to prove to you that she has already been moved 1,000 feet from the place where she was first of all.

Sir Frederick Hopkinson.—She has been dredging, and she has dredged 300,000 to 400,000 cubic yards.

A.—Yes.

Q.—That would take her more than 1,000 feet.

A.—He will explain.

Q.—You say on page 110 that the human factor is all-important. Well, that applies particularly to all constructive works?

A.—Yes.

Q.—Without that proper human factor you can make no success?

A.—That is so.

Q.—What I would like to know is, who has done anything to improve that unhappy state of affairs, when the human factor was not used to produce proper results? Who has done anything, whether by whip or carrot?

A.—Well, I do not think that much has been done to improve the human factor.

Q.—I would like to suggest here that reliance has been placed on letters throughout the whole period. It is action that is wanted, not letters.

A.—Have you ever lived for long in India?

Q.—No, I have not.

A.—Well, if I may say so, it would be a very useful experience to you.

Q.—I have lived in the Sudan, and I encouraged all my staff to look upon the Sudan as a health resort. It was rather difficult, I can tell you, but in the end they agreed in a semi-humorous way that it was.

A.—I suggest that you should go and live a few years in India, and then you would get the proper atmosphere.

Q.—If that is going to lead me to carry on works like the Bombay reclamation, I shall certainly decline to go.

A.—I say in one of my reports that one of the difficulties the Government has in carrying out the work is that they are not allowed to give any encouragement for good service.

Sir Frederick Hopkinson.—I agree that that is a great blot on their procedure.

Chairman.—You have made that point perfectly clear.

A.—Yes.

Q.—It is Mr. Merritt's point put in another way.
A.—Yes.

Chairman.—We remember that.

Sir Frederick Hopkinson.—One word on the last paragraph of your statement about the works being brought to a triumphant conclusion. I suggest that is manifestly impossible; they never can be brought to a triumphant conclusion, and they never will; it is impossible.

A.—Well, again that is a matter of time and opinion.

Q.—No, not of opinion, because the scheme was to have been done in six years. Four years have elapsed, and there is no sight of the end. On this question of control I would like to ask you this. In the case of a work of that kind let to a contractor, would he design and buy the dredger and take it out in the ordinary way? Suppose you let the work to a contractor, he would design and purchase the dredger?

A.—That is a matter of arrangement.

Q.—Suppose you let anyone the contract at so much a yard?
A.—Yes, of course he would.

Q.—He would have a dredger designed, and would buy the dredger?
A.—Yes.

Q.—He would design the gantry for building the sea wall?
A.—He would.

Q.—He would settle on what plant was to be used generally throughout the work —locomotives and cranes?

A.—He would.

Q.—He would also purchase all the plant?
A.—Yes.

Q.—Or requisition it?
A.—Yes.

Q.—And he would engage all the staff?
A.—He would.

Q.—Settle their duties—he would make the dredging programmes?
A.—Yes.

Q.—He would decide where and how the dredgers were to work?
A.—He would. He would do all those things.

Q.—He would approve or disapprove of buying more plant if it were required?
A.—Yes.

Q.—All those things you have done?
A.—We have done a certain number of those things as advisers to Government.

Q.—You have done all of them?

A.—Well, leaving that an open point, the contractor would also have complete control of the costings.

Q.—Let us settle this before we go any further. You have done all those things?
A.—No, I do not accept that.

Q.—Which of those have you not done?
A.—I have bought plant on requisitions.

Q.—Yes.
A.—But I had nothing to do with the settling as to its necessity.

Q.—You had to approve the requisition?
A.—No, I had not.

Q.—In one case you remember you refused to buy it. You said you did not think it was necessary, and you were not going to buy it?

A.—I absolutely refuse to accept the suggestion that I had to approve of the plant. I drew the Chairman's attention to a letter yesterday, and said: "You will note this is a demand, an indent, that I am not asked to approve."

Chairman.—That is the 17th March?

Sir Frederick Hopkinson.—But the original plant was got out by Mr. Lewis in conjunction with Mr. Meik. It was Mr. Meik who settled the procedure.

A.—Excuse me, Mr. Meik did not settle the number of cranes, the number of shovels, and so on.

Q.—That is what Mr. Lewis told us.

A.—Mr. Lewis did not. I read Mr. Lewis's evidence. He said Mr. Meik assisted him.

Q.—You cannot imagine a man like Mr. Meik assisting a man like Mr. Lewis. Would not it be the other way about?

A.—No, I do not agree. Mr. Lewis came to the office and he had the use of the office and the use of the staff. He went to Mr. Meik and said, " What do you think about this? What do you think about that? " I refuse to accept the suggestion that Mr. Lewis was not completely independent to order what he wanted, and I refuse to accept the suggestion that all the plant ordered thereafter was not on demand. It was not for us to say whether we would send it or not. If we wrote and objected, we did it voluntarily as advisers to Government. We had no power whatsoever to say, " We will not send them " or " We will send them." If we suggested " We do not think these things are necessary," the Director of Development said, " I disagree with you and I will allow their purchase."

Q.—So far as the gantry was concerned, Mr. Lewis said positively that Mr. Meik took the advice of a contractor at Westminster and acted against that advice, and said it was the design to build it from a gantry—it was one of your obligations under your contract?

A.—It was one of my obligations.

Q.—The preparation of plans and specification for all the other plant required in connection with the construction of the work?

A.—Yes, on indents received.

Q.—I see what you mean; I see the point.

A.—On indents received.

Q.—But not initiate how much plant was required?

A.—No.

Q.—It is pretty certain that Mr. Meik decided on building that gantry?

A.—Mr. Meik did decide on building that gantry. The gantry was in our original 1919 project.

Q.—It does not matter. He decided that that gantry should be built?

A.—Yes.

Q.—That is a contractor's job, is it not—to decide a point such as that?

A.—Well, in this 1919 Report we considered the best way of carrying out the work, and we designed a gantry. The gantry was some use apparently as it was left in the works afterwards.

Q.—What you mean is the draw was left in?

A.—Yes. It is matter of opinion whether the gantry was necessary or not. I could bring ten engineers to say——

Q.—I am not asking you anything about that. I am only saying that Mr. Meik decided that that gantry should be built?

A.—Yes.

Q.—That is a contractor's job. I am sure you will agree with me there?

A.—Yes, it is a contractor's job.

Q.—I make out that making allowance for the elimination of the concrete blocks and the reduction of the size of the concrete walls, that would reduce your 367 lakhs estimate to 329 lakhs?

A.—Yes.

Q.—The present estimate—that is the present estimate of the engineer—not what you have called the estimate made for political purposes, but Mr. Elgee's present estimate—is 1,000 lakhs. That leaves 671 lakhs as an excess cost over the original estimate. Assuming for the moment that you had let this work to a contractor at 367 lakhs, his loss by the time he had finished the work would have been slightly over £5,000,000 sterling?

A.—No contractor at that time would have taken the work on a fixed basis.

Q.—You think not?

A.—No.

Q.—Not in 1920?

A.—No, I do not think so.

Q.—Not with the sliding scale as contracts were taken in those days, on the advances or reductions in certain items? Generally speaking, surely you would get a contractor to take the dredging and the building of the sea wall on, because the only thing that could affect a contractor out there would be the cost of his plant? Before he made a tender he would get firm offers for the supply of the whole of the plant?

A.—Yes.

Q.—I do not think he would have had any difficulty in getting a tender. However, the point is that had he done so there would have been a loss of £5,000,000. I do not

know of any contractor who could anticipate with complaisance a loss of £5,000,000 on one contract; I do not know if you have ever met one who could?

A.—No; I cannot say that I have.

Q.—The thing is absurd, is it not?

A.—Contractors are not in the habit of losing money if they can help it.

Q.—I quite agree with you. About these steam navvies, I will just make one remark concerning them. You bought four steam navvies. I suggest to you that none of those was suitable for the work it was bought for. They are the wrong type altogether and never could do anything there, and never ought to have been bought?

A.—Well, we did not recommend them.

Q.—Who recommended the first one, the one that was bought in 1920, the "Bucyrus"?

A.—Oh, we come back to the old "Bucyrus"?

Q.—Yes.

A.—I had a telegram—you know all the particulars of it.

Sir Frederick Hopkinson.—I do not. I have never been certain who recommended that.

Chairman.—It started by a telegram sent by Lord Furness to Lord Lloyd, Lord Furness being then on his own yacht at Colombo. He mentioned that there were two "Bucyrus" shovels, and he gave technical details, and he gave prices. There was a cable sent to you asking whether a "Bucyrus" shovel would be of use at the work, and you replied by cable that it would. Do you remember that?

A.—I remember the circumstances. We considered it would be useful for moorum.

Sir Frederick Hopkinson.—My suggestion to you was that it was entirely unsuitable for the work in this quarry?

A.—We had it inspected, and it was purchased.

Q.—But it was the wrong type altogether. None of them could have been any use there. You remember rock crops up all over the place. You could not get a level bed to work the machine on. There are pinnacles of rock all over the place directly you get the moorum off, and no machine could work there.

A—This was intended for moorum.

Q.—That is what I am speaking of—for taking off the moorum?

A.—In the quarry.

Q.—But in the moorum there are pinnacles of rock sticking up all over the place; you could not work the machine at all. It would be idle for three-quarters of the time while you blew off these pinnacles of rock to allow it to move. It is the wrong type of machine altogether. Did you ever in any of your estimates consider the question of interest?

A.—Never.

Q.—You do not say so, I think, in your report anywhere?

A.—No, I do not say so anywhere.

Q.—In work taking six or eight years the question of interest becomes a very important one, does it not?

A.—Yes. I had nothing to do with interest.

Q.—Did you tell the Government that you left them to consider the question of interest?

A.—Well, it was known; there was no need to tell them.

Q.—Up to the present time the cost of the works has been increased by 25 per cent. for interest charges?

A.—Yes.

Q.—That is a very serious addition to an estimate, is it not?

A.—Yes.

Q.—On January 10th, 1923, you wrote: "In particular the annual programme of work should be worked out with the greatest detail and in close conference with the officers concerned, otherwise smooth working is impossible." That is all very well as a statement, but can you tell me what was done? I have never seen any case of a detailed programme for the ensuing year. Can you tell me if that was ever done?

A.—Where is this?

Q.—It is page 20 of volume 8 in your annual report, February, 1922. I have given you the actual words: "In particular the annual programme of work should be worked out in the greatest detail in close conference with the officers concerned, otherwise smooth working is impossible." Did you insist upon an annual programme for the ensuing season being worked out in the greatest detail?

A.—We come again to the old question of writing letters.

Q.—No, supervision.

A.—Supervision—I had no power to insist on anything. I could write that in a report and do my best, but I had no power to do anything.

Q.—Then I will not carry that any further. You have made a complaint that the dredgers have been mishandled; I do not quite know what that means. Do you mind explaining to me exactly what you mean by mishandled?

A.—Well, I should prefer Mr. Settle to do that, he has been in Bombay.

Q.—This is your letter to the " Times " of April 14th, 1926.

A.—I will give you one example. They worked only one shift a day—that is mishandling the dredger.

Q.—We will come to that to-morrow. That is one instance. Then one of the questions that arises on that is, did you give instructions for two or three shifts a day to be worked?

A.—When Mr. Brims went out his instructions were to work 24 hours a day. I put in a letter here yesterday when we wrote out and said, " Are you making arrangements for two shifts? " We got a reply from the Chief Engineer quoting four letters that he had written to the Government asking them to get the necessary crew. I can only repeat that we had no control.

Q.—I do not think I have seen those at all.

A.—It came up yesterday.

Chairman.—Is that one of the letters you have handed in?

A.—Yes.

Chairman.—I have not had time to read all those yet.

Sir Frederick Hopkinson.—I have not got it.

Mr. Ewbank.—I do not think I have seen it.

Chairman.—You say it has been handed in?

Sir H. Courthope-Munroe.—Do you remember the date of it?

A.—I do not remember the date of it.

Chairman.—What is it?

A.—We wrote out to Bombay " Are you doing everything you can to put on two shifts for this dredger? " We telegraphed to that effect. We got a letter back from the chief engineer saying, practically: " I have written four times to the Government asking them to sanction the men, and I have not any reply yet."

Sir Frederick Hopkinson.—I would like to see those letters. I have not seen them yet. Was it your original intention to work the dredger 24 hours a day? *

A.—Yes—well, 15 pumping hours.

Q.—In two or three shifts?

A.—In two shifts.

Q.—Two 12-hour shifts?

A.—Yes.

Q.—I think you said you had nothing to do with the actual agreement with the men who went out, so you cannot tell us if it was provided therein that they should work 12 hours a day?

A.—I cannot tell you.

Q.—Your whole scheme depended upon the dredging, did it not?

A.—Undoubtedly.

Q.—Even if your dredgers did 2,000 yards an hour it would be no good to the success of the scheme if they only worked eight hours a day?

A.—Not the slightest.

Q.—What puzzles me is that although the dredger began in December, 1923, up to the end of June, 1926, there was no working 24 hours a day.

A.—No.

Q.—It seemed to come as a shock to them that I suggested that they ought to work 24 hours a day. It was an absolute shock to them.

A.—You will see it in Mr. Brims' evidence. He says that when he left London he left London with instructions to work 24 hours a day.

Q.—What I would like to know is: who is responsible for working only a single shift of eight hours in the first season, and a double shift of eight hours each in the second season? Your scheme as a scheme was destroyed by that?

A.—Yes. I say the responsibility was with the Executive.

Q.—There again comes up the question: what did you do?

A.—Well, we have said quite enough about what we can do; but there you are up against it. How can you guarantee a dredger's output if your hands are tied behind

* See Appendix VI.

you and you have no power to give bonouses or appoint dredger men or increase their pay, or make any arrangement at all?

Q.—Did you ask me what should I do?

A.—I said would you consider yourself responsible under those conditions.

Q.—I thought you said you would like to know what I would do. I can tell you exactly what I should do. I should leave the vessel. I should not stay there five minutes. In the same letter you say that nevertheless the dredger has done nearly double the work attributed to it?

A.—Yes.

Q.—Can you explain that? The work is measured by your staff out there. Do you say they have under-measured it by 100 per cent.?

A.—No; we know about that. That is the old question of the leaking through the wall.

Q.—But they have attributed to them only the quantity dredged?

A.—No.

Sir Frederick Hopkinson.—The figures have all been given to us.

Chairman.—There are two columns. 1,020 dredged, 627 retained; 856 dredged, 462 retained.

A.—I cannot follow that.

Q.—It is quite simple. I will just give you the figures. It is page 3 of Sir Lawless Hepper's report: 1923-24, 1,020 dredged, 627 retained; 1924-25, 856 dredged, 462 retained; loss of more than 40 per cent. in 1923-24; a loss of more than 55 per cent. in 1924-25. It is a total loss of 900,000 cubic yards. That is how the figures are split up.

Sir Frederick Hopkinson.—You cannot blame the dredger if the material leaks through the wall.

A.—No.

Q.—It is nothing to do with the dredger.

A.—That is quite true.

Q.—You must not consider that in judging the dredger.

A.—That is so.

Q.—You must take the quantity that the dredger has done by the sections in the harbour?

A.—Yes.

Q.—That is what I presume the engineers have done in giving the total quantity dredged, because they have all these soundings. They are done in a very inefficient way, because instead of plotting the sections, as they ought to plot them, they are going on the soundings?

A.—Yes; I can quite understand that.

Q.—So that was a misstatement, where you say it has done double the work attributed to it? You probably did not know that they had made that allowance?

A.—Probably not.

Q.—Further on you say that you know the dredging results have improved enormously this year. I am sorry to say that is not correct. I think they are a little worse than previously. There is no enormous improvement at all?

A.—Well, I am not surprised.

Q.—But you said as a fact that they had improved?

A.—Well, I understand they have improved.

Q.—Not at all. They are, if anything, a little worse.

A.—Very well.

Chairman.—I am not sure that that is so.

Sir Frederick Hopkinson.—I beg your pardon. There was a little improvement in the third year. It was 1,020 the first season per pumping hour; 856 the second season, and 959 the third. I had transposed the figures?

A.—Yes.

Sir Frederick Hopkinson.—But that is not an enormous appreciation.

Sir M. Visvesvaraya.—Did not they get 1,800,000 yards?

Sir Frederick Hopkinson.—That will include both dredgers.

Chairman.—But how much they retained they did not know.

Sir M. Visvesvaraya.—They say they retained more than they got.

Sir Frederick Hopkinson.—It is only fair that that should be pointed out to you. The last figures show the impossibility that they retained more than they dredged.

Sir M. Visvesvaraya.—Probably they over-estimated the loss.

Chairman.—About the letter where the double shift occurs, these are the only documents I have: the note that you handed in yesterday, the proof of Mr. Halcrow, Mr. Settle's statement, and this other document. I do not quite follow what this is. Is it possible it was handed back to you?

A.—It is possible it was handed back. I will look for it. At all events, you remember its being put in. I read it.

Q.—My memory fails me for that, but it will be on the Shorthand Note?

A.—Yes.

Sir Frederick Hopkinson.—I do not remember hearing it.

A.—I read it.

Chairman.—Then it will be on the Shorthand Note?

A.—It will be on the Shorthand Note.

Q.—Would it be convenient for Mr. Halcrow to come at 11 o'clock to-morrow morning?

A.—Am I nearly finished?

Sir Frederick Hopkinson.—I have only two subjects to deal with. It is not worth while starting on them at two minutes to five.

A.—Which are they.

Sir Frederick Hopkinson.—Dredging and estimates.

Chairman.— Do you prefer to come to-morrow morning yourself or interpose Mr. Halcrow? What do you say.

Sir H. Courthope-Munroe.—I do not quite gather what the question is.

Chairman.—Sir George Buchanan has been in the box for four days and is probably tired. It will only be a question of a couple of hours to finish him off. The point is would he like to go on to-morrow morning, or would he care to have a rest and interpose Mr. Halcrow? We are trying to suit Sir George's convenience in the matter.

Witness.—Yes; Mr. Halcrow can come to-morrow.

Chairman.—Then Mr. Halcrow and Mr. Settle will be begun to-morrow.

Sir H. Courthope-Munroe.—You have got his report. That has been handed in with his draft proof.

Chairman.—That is right. We hope to get through both of these gentlemen to-morrow, but we do not want them to leave the room without having told us everything they wish to. There is one other matter. We have all a demi-official engagement at half-past 12 until 3, so that we would adjourn at half-past 12 and return here at 3 o'clock.

Sir H. Courthope-Munroe.—If you please. It is understood that Sir George Buchanan will not be here to-morrow.

Chairman.—No; Sir George Buchanan will not be here to-morrow, but we will spend the day with Mr. Halcrow and Mr. Settle. If convenient to you we could sit at 10.30.

Sir H. Courthope-Munroe.—No; I should prefer 11 o'clock.

Chairman.—Very well.

(Adjourned to to-morrow at 11 a.m.)

The Committee Assembled at 11 a.m. on the 3rd November, 1926, all the Members being present.

56th Witness, Mr. William Thomson Halcrow, M. Inst. C.E.

WRITTEN STATEMENT.

My connection with the Back Bay Reclamation Scheme dates from October, 1922. At that time I was asked by the late Mr. C. S. Meik to visit and inspect various works abroad for which his firm were the engineers, including the Back Bay Reclamation Scheme.

Sir George Buchanan, whom I had met on one or two occasions, had already left for the East, and the general particulars of the Back Bay works and personnel were described to me by Mr. C. S. Meik.

I learnt that Sir George Buchanan had been called in to report on the scheme and that the Government of Bombay had decided to adopt his report and had appointed the firm as engineers for the work.

I was also informed that the Government of Bombay had entrusted the execution of the work to the Development Department under the management of its Director, Sir Lawless Hepper.

The firm had to advise the Government of any matters which they considered necessary in connection with the carrying out of the work.

In addition to the ordinary duties of engineers for large works, the firm had to invite tenders and examine and report to the India Stores Department upon the tenders for any plant which the Development Directorate desired to purchase in this country. When orders were placed by the India Stores Department, the firm carried out the necessary inspections and tests and reported progress to the Development Department.

Also, in the case of staff or other employees which the Department required from this country, the firm assisted the High Commissioner in the selection of suitable men. The agreements under which the men were engaged were prepared by the Government and the salaries, wages, or terms of appointment were fixed by the Development Department.

Prior to my departure for the East I was shown copies of the drawings of the work and handed copies of the detailed specifications which the firm had prepared and also a copy of the Development Department's project estimate and programme for carrying out the work.

I arrived in Bombay on 1st December, 1922, and left on 20th January, 1923.

On arrival in Bombay, I presented my letter of introduction to Sir Lawless Hepper and had an interview with him. I had already studied his project estimate and drew attention to one item which in my opinion required the most serious reconsideration, namely, that the Department did not propose to commence dredging until the season 1924-25. The dredger " Sir George Lloyd " had arrived in Bombay in time to commence dredging in the season 1922-23 and the state of the works at that time was such that there did not appear to be any reason why the commencement should not have been made in that season. The Director did not appear to be very interested in my suggestions and passed me on to his Chief Engineer.

I had several interviews with the Chief Engineer, who was I thought in a very poor state of health. Although I was anxious to learn something of the methods which the Development Department adopted for carrying out the work, it appeared to me by his attitude that the Department objected to anything suggestive of interference on the part of the engineers in matters of construction.

I was particularly anxious to see the detailed programme for working the dredging plant but failed to obtain any information as to whether a programme had been prepared or not. I formed the opinion that the Department had not dealt with this matter as they had laid out their general programme to commence operations in the season 1924-25 and it was then only 1922.

Regarding designs for permanent work, which it was the firm's duty to prepare, I learned before leaving London that some difficulty had arisen through the Chief Engineer in his capacity of Resident Engineer refusing to send home the data necessary to complete the designs of the storm-water drains.

I discussed this matter with the Chief Engineer, who informed me that the Director of Development had instructed him not to send the information as a question had been raised as to whether these drains were included in our work. I learned that the drains had all been designed and that work on their construction had already commenced, and in the case of one culvert work was approaching completion.

I made the following note at the time that we had asked the Chief Engineer to show us the drawings for the drains : " Difficulties were at once put in the way and all sorts of objections raised by the Chief Engineer."

It was subsequently decided that the drains were part of the work comprised in forming the reclamation, and later on copies of the plans prepared by the Development Department were sent to London.

In this connection the question of whether or not the system of roads and drains as laid down by the consulting Town Planner should be included in the firm's work was discussed. The complete lay-out of the reclaimed area had not originally been contemplated and in my view the Government of Bombay would not complete the surface as a whole for many years to come. It was decided at that time that the firm's work referred to the reclamation only and not to the lay-out.

While I found it difficult to obtain information about the work from the Chief Engineer, I was introduced to the Deputy Chief Engineers and paid several visits to each of the sections under their charge. Here, I learned something of the organisation of the work. The Deputy Chief Engineers (sub-agents, as a contractor would call them) complained that there were no conferences regarding the work as a whole, that each worked in a watertight compartment, and was given a minimum of information by their chief. I note that in the evidence taken by the Committee in Bombay, the present

Chief Engineer (Mr. H. A. Elgee), who was then Deputy Chief Engineer, Marine Lines, stated that he had never been given detailed specifications for the work, although these specifications had been prepared.

Two of the three Deputy Chief Engineers appeared to be dissatisfied with their seniors in command; the third did not make any complaints, but was anxious to find another billet when he next came home on leave.

As an instance of the manner in which the general management of the work was conducted by the Department, on one occasion when I visited the Colaba section, the Deputy Chief Engineer told me that he had just received two steam cranes which he did not want, as he had already more cranes then he required.

The firm informed me that in their capacity as advisers to the Bombay Government they had had occasion to point out that the Development Department were in their opinion ordering quantities of plant which appeared to them to be excessive. They asked me to look into this matter and let them know whether I thought they were unjust in their criticisms. I examined the quantities of material to be handled, basing as requirements the Development Department's project estimate and programme of work. After allowing that the Department would require more plant than a contractor would place on the works, I estimated that there was a considerable excess of land plant. The Department's working programme in relation to the quarry output I subjected to criticism. The average annual output of stone required was about 230,000 cubic yards, the programme required for the year 1923-24 an output of 440,000 cubic yards, which is nearly double the average output. To handle this quantity, considerably more plant would be required than would have been necessary under a more evenly proportioned programme.

In the case of the concrete, the ratio of maximum output for one year of the average is even greater, the figures being 27,500 as against 64,000 for the season 1923-24.

When discussing the matter of excessive rolling stock and other plant to handle stone, I was informed that the Back Bay scheme was not the only work for which Kandivlee quarry had been opened and that the Development Department had other uses for the stone. As the firm had nothing to do with these other works, further criticism was of little value.

In the notes I made of my first visit, the following occurs: " Of the 24 cranes of various types on the works, only five were working during my inspection." This condition of affairs continued throughout my visit, and I saw enough to form the opinion that Sir George Buchanan was justified in his criticism of extravagance.

I inspected the materials used for concrete, and checked the relative proportions of aggregate and cement. These I found to be in accordance with the firm's specifications for the work.

Several matters concerning the construction of the permanent works were discussed during my visit and it was impressed upon the Development Department the necessity for carrying forward the protection stone to the rubble mound so that it might be deposited before the monsoon broke. I mentioned also the necessity for using the run of the quarry for the rubble wall; they would thus have all sizes of stone.

I note from the evidence taken in Bombay that uncertainty is implied as to how or why large stones were substituted for concrete blocks. I quote the following clauses from the firm's specification :—

> *Reclamation Wall. Clause* 46.—The Northern section of the wall which is referred to in this specification is to consist of a continuous bank or mound of rubble stone surmounted by a superstructure of mass concrete, the rubble stone being obtained from the quarry at Kandivlee. All stone used in the work is to be of best quality, hard, sound, and free from all imperfections.
>
> Before blasting and quarrying the rock the overburden is to be removed so that the stone can be obtained free from any clay, soil or sand.
>
> The stone, after being blasted and broken down, and before it leaves the quarry, is to be graded as follows :—Large stone 4 tons in weight and over are to be reserved for protecting the sea face of the wall. The remainder will be used for the rubble mound and for crushing for concrete aggregate.
>
> *Protection on Sea Face of Rubble Mound. Clause* 49.—After the concrete wall referred to in the last clause is completed for a sufficient length and before the finishing layer of concrete is placed on it, large stones (see Clause 50) or alternatively concrete blocks are to be deposited on the sea face of the rubble mound.
>
> *Large Stones on Sea Face. Clause* 50.—If a sufficient number of suitable stones not less than 4 tons in weight can be obtained from the quarry the Engineers may permit them to be used for protecting the sloping sea face of the rubble mound. All such stones are to be brought from the quarry in suitable wagons which are to be conveyed over a temporary railway placed on the top of the concrete wall to a travelling crane also on the wall. The stones are to be lifted by this

crane and deposited on the slope of the rubble mound commencing from the toe of the slope and working up to the base of the wall. Care is to be taken in selecting the stones so as to get them wedged together in order to prevent their being moved by the action of the sea.

Large Concrete Blocks on Sea Face. Clause 51.—Should a sufficient number of large stones not be procurable from the quarry then large blocks of concrete are to be used for the protection of the sea face of the rubble mound; these blocks will weigh approximately 20 tons each and are to be of the dimensions shown on the drawings, having all edges chamfered 2 inches by 2 inches measured on the square. They are to be made in accordance with Clause 37 herein in the proportion of 1 of cement to 6 of aggregates and are not to be deposited on the sea face until they are 3 months old.

If concrete blocks are used they are to be placed " pell mell " on the surface of the rubble mound as it will not be possible to wedge them together as specified for the stones.

In London, after the death of Mr. C. S. Meik, I acted for Sir George Buchanan when he was away and assisted in examining and reporting on tenders for plant ordered by the Development Department, and in examining applications by candidates for vacancies on the staff of the Development Department which were sent to us by the High Commissioner.

As an instance of the attitude of the Development Department to my firm, when Mr. J. R. Settle, M.Inst.C.E., an Engineer with much greater experience in the design and construction of sea works than any member of the Development Department, of whose record I am acquainted, returned from Bombay, I learned that the senior members of the Department did not avail themselves of his knowledge and experience.

Estimates.

When Sir George Buchanan reported to the Government of Bombay on the Back Bay Scheme, in 1919, he estimated the cost of the work at 367.61 lakhs. It is well known to all Engineers or Contractors who carried out public works during the years following the termination of the war that there was an enormous increase in all prices during 1920 and 1921; such increases could not have been foreseen and authorities and companies suffered financially in consequence.

During the period to which I refer, I have knowledge of extensive sea works carried out in the Tropics, of which the following brief particulars are of importance.

The increase in prices between 1912 and 1919 was from 10 to 20 per cent. and between the end of 1919 and 1921 from 50 per cent. to 100 per cent.

This case is parallel to the Back Bay work which passed through the same phases as regards cost.

The prices in Sir George Buchanan's report of 1919 compare well with prices of the work referred to above and in some cases are higher.

When I read Sir George Buchanan's report and had beside me at the time the Development Department's project estimate, I applied to the former's estimate a percentage based upon my knowledge and experience of works carried out after the war and I found that, after deducting from the project estimate a sum which had been included to cover the cost of the Town Planner's lay-out of the reclaimed area, which was not contemplated at the time Sir George Buchanan's estimate was made, I found that the project estimate for the reclamation proper was rather in excess of what I would have considered a reasonable increase to Sir George Buchanan's estimate. It is, in my opinion, wrong and misleading to the public to compare any estimate prepared in 1919 with an estimate of 1922 without allowing for the rise in prices which took place after the war and which could not have been foreseen in 1919.

In the knowledge of what the work has actually cost, as carried out by the Development Department, Sir George Buchanan's estimate of 1919 is, in my opinion, a fair one. Having learned that the late Mr. C. S. Meik had been closely associated with Sir George Buchanan in the preparation of the estimate, I am convinced that no better or more reliable estimate could have been prepared at the time.

Sir George Buchanan complained that the project estimate, which was prepared by the Development Department and approved by the Government without his knowledge, was excessive; that he was justified in his statement has been shown in the evidence taken in Bombay in which Sir Lawless Hepper states that he anticipates a saving on the works other than dredging of 35 lakhs.

As regards the cost of dredging, the Development Department estimated to operate the plant at a cost of 5 annas per cubic yard. Sir Lawless Hepper has revised that estimate and now states that the dredging will cost 310 lakhs instead of 82 as he originally estimated. It has been revealed by the evidence taken by the Committee in Bombay that the revised dredging estimates were based on improper data and are therefore of no value.

While I accept all figures and measurements made by the Development Department with reserve, in the absence of proper cost abstracts, I feel disposed to accept the figure given by the Deputy Chief Engineer, Dredging, in evidence as to the present cost, viz., 8 annas per cubic yard. This cost is the result of working the dredgers for less than two-thirds of their proper time, and further without energy or incentive to the men to get the best out of the plant, and it is difficult to believe that the dredging cannot be carried out at about the rate of 5 annas estimated by the Development Department themselves, working full time.

Dredging.

It has been proclaimed to the world that the dredging plant is a failure, and that in consequence the cost of the work will be 1,100 lakhs instead of 700 lakhs of rupees; also that this state of affairs is entirely due to Sir George Buchanan. The estimates and statements are absolutely misleading and inaccurate, as has been revealed in the evidence taken in Bombay.

The Development Department laid out their programme of work to commence dredging in the season 1924-25. (See print copy of project estimate.)

In consequence of a protest by Sir George Buchanan, the Development Department improved upon their programme and commenced dredging in the season 1923-24. As far as my investigation of the work went, I could see no reason why the dredging could not have been commenced in the year 1922-23, the dredging plant having arrived in Bombay in time for that season.

In the spring of 1925, having perused the weekly statement of progress which was sent to London, a letter was addressed to the Department drawing their attention to the low output of the dredgers. The reply received was unsatisfactory, and only emphasised what I have always felt with regard to the Development Department, that they resented interference by the engineers in matters of execution.

In July of 1925, a letter was received from Bombay informing us of the revised estimate which had been prepared based on the actual dredging output. On reading this letter I concluded that the estimate must have been prepared for special reasons, and, on the face of it, was grossly misleading. This is the only conclusion at which any fair-minded engineer could arrive.

Mr. Brims, the Deputy Chief Engineer, Dredging, came home on leave in the summer of 1925 and called to see me. I took the opportunity of trying to find out what was at the bottom of the dredging difficulty in Bombay. Mr. Brims was rather reticent, but I learned enough of the way things were going to come to the conclusion that the dredging plant as a whole was not being properly handled.

The material did not differ from what was expected, but he admitted that there had been a tendency to get the last yard of material which the dredger would cut. I told him it was, in my opinion, a mistake to attempt to scrape hard material from the bottom. There were ample supplies of mud and clay, for which the dredger was built, and to retard the output for a few yards of hard moorum was not right. One result of scraping the bottom was that the cutter blades were damaged.

Sir George Buchanan, owing to serious ill-health, was unable to proceed to Bombay, and returned to this country, when I put before him all that I had learned. He protested to the Department in reply to their 11-crore estimate that they were mishandling the plant, and that he was justified in making that statement has been proved by the evidence taken in Bombay. Two points only need be mentioned to prove mishandling: (1) The dredgers had not even by the end of the second working season been put on their full working time of 24 hours a day, and (2) no incentive by way of bonus to the crews of the vessels had been arranged. Brims admitted to me that he had never known of a case of the kind where bonus was not arranged right away at the start of the work. This is the standard practice of the most experienced contractors in dredging, and the Director of Development certainly made a grave error of judgment in not insisting that the dredgers should work 24 hours a day and that the men should be properly bonused on output.

Although the Director states that he knows nothing about dredging, he might have learned something from his staff, some of whom, to my knowledge, had been many years on the staffs of eminent firms of contractors. Brims spent years on a large dredging contract where they continuously worked two shifts of 12 hours a day.

Brims stated that apart from dredging he felt that he did not get the support he would have liked from his superiors. He told me that much material was being lost through the wall, and that he wanted to blind it, but this was not allowed.

Mr. Settle reported on his return from Bombay that Mr. Brims, the Deputy Chief Engineer, and Mr. Speirs, the dredging-master, spent much of their time in superintending the overhaul of the "Jinga." In fact, the operating of the expensive dredging plant appears to have been left largely to the assistant dredging-masters, who came fifth in order of seniority.

I have particulars of dredging on fixed price contracts amounting to more than 15 million cubic yards. On one home contract the working hours were 132 per week, being 11 shifts of 12 hours, and on another contract in the tropics the working hours were 144 per week in two shifts per day.

Sir George Buchanan in his estimate allowed 15 hours pumping time per day of 24 hours, which is equivalent to 62½ per cent. actual pumping time for the dredging plant. This is a reasonable estimate.

It has been suggested in the evidence that the nature of the materials to be dredged in the harbour was not known. In all my experience I have never come across a mass of material so thoroughly investigated by boring as the area under consideration. Over 1,300 borings were taken. In the case of the dredging contracts to which I have referred above, less than 5 per cent. of that number of borings had been taken for the removal of 15 million cubic yards of material; the contractors in these cases did not take any borings to verify those placed before them when tendering and carried out the work as already stated on fixed prices.

My experience is that when borings err, as they sometimes do, the level of hard material has invariably been found at a lower level than that indicated by the borings. I can find no evidence that the depths of dredgable material in the harbour are less than those indicated by the borings; on the contrary, it has been stated in evidence that the materials have so far generally agreed with the borings.

The material in the harbour consists of mud, soft clay and stiff greasy clay, overlying hard materials, rock and some hard moorum. A dredger should be designed to give an average output on the average material, which is soft clay. Stiff unctuous clay is good material for a vessel of the type of the " Sir George Lloyd " to cut, and represents the hardest material required to be dredged.

The output per hour, as returned by the Development Department, for the " Sir George Lloyd " is only about 50 per cent. of the designed output, and personally I was not surprised at the low figure when I learned that no proper system of bonus had been arranged at the start as an incentive to the crews to get the best out of the plant.

The number of pumping days worked by the " Sir George Lloyd " last year is stated as 167, and there was a delay of 17 days, which proves that Sir George Buchanan's estimate of 170 days was reasonable.

The Development Department state that the dredger can average 2,000 cubic yards an hour for a month. If for a month, there is no reason why it cannot continue for six months.

Much has been said in evidence about a guarantee by the builders that the dredger would pump 2,000 cubic yards per hour. I do not remember any case where the builders of plant for constructional works were to guarantee that purchasers would obtain a specified output.

When purchasing plant for excavating purposes, say, dredgers, land excavators, grab cranes, &c., it is customary to have a detailed specification for the boiler and engines and to require certain speeds of operating, e.g., lifting, slewing, derricking, travelling speeds, or in the case of dredgers, when of the bucket type, the number of buckets lifted per minute, and where of the suction type, the discharge and power of the pump.

The plant is tested against the specification before being taken over from the builders, and the purchaser takes the responsibility of getting the best out of the machine. Experience alone teaches those who handle excavators or dredgers what outputs to expect in varying classes of material. Although I have experience of hundreds of thousands of pounds' worth of plant purchased and handled, I do not recollect one case of a guarantee by builders that purchasers would obtain a specified output when worked *in situ*. It is highly improbable that any firm of dredger builders would guarantee a specified output for a dredger worked by the Development or any other Department.

Mr. Wm. McMurray, Director of Messrs. Wm. Simons & Company, Limited, told me he was in Bombay when the dredger " Sir George Lloyd " was first put to work, and that he had endeavoured to help the Department in any way he could, but his efforts were not well received. He felt he was not wanted and left Bombay.

Criticism has been made that it was estimated that the nett result of the filling would be the same as the quantity of material dredged from the virgin strata at the bottom of the harbour. All forms of clay bulk when cut out of their natural beds are deposited as filling. Mud contains a much higher percentage of water when pumped through a pipe-line and deposited as filling. The surface of the mud when exposed to the sun will dry out and give up a considerable quantity of its moisture, but the drying out will not carry to any great depth, especially in the case of the Bombay material, which has an unctuous nature. On balance, one would expect an increase of bulk, and an estimate allowing for no bulking would be said to be on the safe side. According to the figures given in the evidence on the season's work completed this year, the bulking works out at 24½ per cent.

Evidence has been given as to the manner in which the possible shrinkage was investigated. One witness explains that he took a pot of the finest surface mud from the reclamation, evaporated the sample, and based a calculation for the whole scheme on the result, which showed some 35 per cent. shrinkage, and I gather was the basis of the 40 per cent. figure in one estimate.

Again, moorum filling is assumed to shrink after excavating from the solid when deposited in Back Bay.

It is stated that considerable loss took place in the reclamation, due to material escaping through the rubble part of the wall. The specification for the rubble is given in clause 46 as already quoted above.

If the run of the quarry be tipped in the wall, the interstices depend on the nature of the material as quarried. If there is a large percentage of small material, the rubble would be choked by the pumped filling. In the case of a large reclamation with which I am acquainted, no blanketing was put on the mound. In that case the class of stone contained a large percentage of small material. After his 1923-24 visit, I enquired of Sir George Buchanan regarding this point, and he informed me that he saw very little loss through the rubble, but that there was considerable loss through an opening in the wall, which he advised the Department to have closed up. The necessity or otherwise for blanketing the mound with moorum or similar material was discussed during my visit to Bombay, and I understood the matter was left to the Chief Engineer to observe carefully what actually took place, report, and take the necessary action. If the loss of fine material was not serious, it was to the advantage of the reclamation to have a large quantity of better material and save on the moorum topping. It would appear, however, that if the measurements of the Development Department are correct that the loss was considerable in the first and second years, but no report to that effect ever reached my office until the final figures for the season were available. In the third year there was a large gain.

When in Bombay I learned that the then Chief Engineer of the Department was very anxious to find the whole of the material for the filling in Back Bay, because he believed it to be better material than that which was available in the harbour. He had in hand at that time a series of borings in Back Bay, the results of which he eventually reported, stating that there was available 25,332,000 cubic yards, or more than enough for the whole reclamation.

The material would be more difficult to obtain, and the programme eventually decided upon was to fill the Marine Lines end from Back Bay by the " Kalu " and the centre and southern parts from the harbour, as originally intended. This arrangement overcame the difficulties which had been put in the way by the Port Trust and the Royal Indian Marine, who wished to restrict the area of dredging in the harbour.

In order to help the Department we looked into the question of the best way to put the " Kalu " to work in Back Bay. I suggested that the " Kalu " should cut a flotation channel, pumping the material through a short pipe-line, say 100 yards, to one side; having reached a pre-determined point she would connect up to the pipe-line and commence pumping into the reclamation. To cut a channel, the removal of about 100,000 cubic yards of material was necessary. With the dredger working her full time, but only allowing one-third of her output, say 500 yards an hour, the cut could have been completed in two to three weeks.

Viewing the dredging as a whole, notwithstanding the methods adopted by the Department in handling the plant, they have accomplished about 4,000,000 cubic yards of filling out of a total of 25,000,000. They admit in evidence that they could increase the output of the " Sir George Lloyd " by 50 per cent. This they can obviously do if they work the customary 24 hours a day instead of 16, and drop the luxury of stopping for meals. That would bring the " Sir George Lloyd's " output of dredging (based on the figures given in evidence for last season) up to $2\frac{3}{4}$ million cubic yards per annum, but this output could be greatly increased by proper organisation and should reach 5 millions with the excellent plant and ample quantities of good dredgable material proved. The " Kalu " is reported to have dredged 338,000 cubic yards in $2\frac{1}{2}$ months. In six months she could do, say, 800,000 cubic yards, and if put on proper working time this would be increased by 50 per cent. and reach 1,200,000 cubic yards.

Without allowing for any improvement in intensity of output due to organisation the two vessels as worked by the Department could dredge 4 million cubic yards per season.

According to the project estimate, at the end of the season 1925-26 the amount of dredging accomplished should have been $7\frac{1}{2}$ million cubic yards. Against this they have accomplished 4 million cubic yards. To complete the work within the Development Department's project estimate, viz., by the end of the season 1930-31, there remain five seasons still to go and the quantity to be handled about 21 million cubic yards. In five seasons this represents 4,200,000 cubic yards per season, so that with the plant available and without exercising any greater energy than in the past, except to work

the dredgers 24 hours a day instead of 16, they could finish the work in accordance with their own estimate.

Sir George Buchanan's and C. S. Meik and Buchanan's Position with Regard to the Work.

Conflicting evidence has been heard with regard to the position of the Engineers for the work, and some confusion appears to exist as to the relative meaning of the terms "Consulting Engineers" and "Engineers responsible for supervising the work." Professional firms or the individual partners in a firm are sometimes the one and sometimes the other. I occupy both positions at the present moment. As Consulting Engineer I report and advise when requested, but my clients have their own engineering staff who prepare designs and specifications, and when required I examine plans submitted and visit and inspect works under contruction. As Engineer for works, I am responsible for preparing plans and specifications and supervising the construction of the works, but in no case do I have executive control over plant or labour.

In the case of Back Bay the firm were appointed "Engineers." They prepared plans and specifications of the permanent work in accordance with the practice of the profession and inspected the carrying out of the work. The Government of Bombay placed the execution of the works in the hands of the Development Directorate who took the same position as contractors, and rightly assumed full control. They prepared their own works programmes and submitted to the Government their own estimates for carrying out the work. They ordered the plant and materials, and engaged the men they required. They fixed rates of pay and arranged sub-contracts, all without reference to the Engineers.

In view of the work being departmental, Sir George Buchanan undertook to prepare enquiries for plant, to examine them and advise the India Stores Department on tenders received, and to inspect plant before shipment. He also agreed to advise the Government on all matters relating to the works under construction. All these duties have, as far as I can judge, been performed. The Director of Development in many cases did not act on his advice when given, clearly showing that he knew that the responsibility for the execution of the works rested on his own shoulders.

Sir George Buchanan had to visit the works every year. He did so and remained in Bombay for a longer period than was necessary in my opinion, and certainly much longer than I have ever known an Engineer for large works to stay. The opinion I have formed from my knowledge of the work is that the Director of Development did not approve of having an independent engineer who could criticise the work.

No Engineer or Contractor could possibly be in executive charge of works unless all the staff and employees were subject to his orders, and he was in a position to engage or dismiss whom he willed. It is absurd to suggest that Sir George Buchanan or the firm held that position. It is neither implied nor stated in their agreement, and I have not seen any evidence to lead me to believe that there was any intention other than that the Development Directorate were to be in sole charge of construction, as in fact they were.

It is possible that the position of the Chief Engineer requires explanation. The Director of Development had works other than the Back Bay scheme under his charge, and the firm had the nomination of a resident engineer for Back Bay who had to carry out the duties of the chief executive officer to the Director. Such cases only occur when work is done "departmentally." The duties of the resident engineer are light in the circumstances, but at one time the Government suggested that the firm should have a separate staff. Sir George Buchanan has dealt with this matter in his statement. Personally, I should have preferred that the firm had had a separate resident engineer under their direct control.

The dual position is not novel. I occupied a similar position on a pier work some twenty years ago, being responsible to the firm's clients direct for the execution of the work and to the firm for carrying out their plans and specifications.

More recently, in 1922, and also abroad, a harbour work was let by contract under competitive tender, and we appointed our resident engineer. At the end of a year the contractors had made such poor progress that the contract was determined, and the firm's clients decided to carry on the work by direct labour. The resident engineer undertook the work, ordered his plant, and made all arrangements for labour and materials for the clients. He reported progress, and referred all questions as to quality of materials, details of design, etc., to us. The work was completed with entire satisfaction to all parties.

Conclusions.

There is nothing wrong with the Back Bay scheme as an engineering work. It consists of two main items (1) four miles of sea wall and (2) 25 million cubic yards of filling. The former is over 90 per cent. completed, and the design has proved to be

satisfactory; the latter is about 16 per cent. completed, and as I have endeavoured to show above, there does not appear to be any physical reason why the remaining dredging should not be done with the plant available within the time estimated by the Development Directorate, namely, by the summer of 1931.

The outcry against the scheme is unjustifiable from the engineering point of view for the following reasons :—

(1) The sea wall has proved a success.

(2) There are ample quantities of filling material in the harbour and Back Bay. The borings taken by Mr. Kidd in the harbour are the most complete I have ever seen or heard of, and have in practice proved to be reliable. Those taken by the Development Department in Back Bay are open to doubt, but there is plenty of suitable material for filling in the Northern sections of the reclamation.

(3) The dredger " Sir George " if properly handled can give her designed output in the material in the harbour. The Development Department staff have admitted this to the Committee.

An action taken by the Bombay Government is open to criticism. The Advisory Committee appointed to investigate the activities of the Development Department had as its Chairman the Director of Development.

When the Advisory Committee issued their report, which must have given rise to doubt in the minds of the Government, the action to take would have been to refer the matter to the Engineers for the work for their opinion and report. No such action appears to have been taken and the estimate of £8,000,000 was broadcast. A little later, the Government publicly stated that they would have to modify the estimate, showing that the £8,000,000 was of little value.

In my opinion the proper course to pursue was to :—

(1) Complete the sea wall, parapet and storm water drains.

(2) Complete filling, by dredging from the harbour and Back Bay.

(3) Defer moorum filling except where immediately required for roads, or to prevent ponding.

(4) Defer the development of the area as laid out by the Town Planner.

(5) Complete the work by contract.

According to the Development Department's estimate, they required 39 lakhs to complete (1).

On the basis of 5 annas per cubic yard, for operating the dredging plant it would require about 66 lakhs to complete the filling, but the Back Bay material is harder than that in the harbour and will bring up the average cost. Against this, the better class of material will ultimately effect a saving in the moorum topping. Taking an overall average of 7 annas, we have 93 lakhs for dredging.

The total cost for completing the reclaimed area (1) and (2) above is therefore 132 lakhs which, added to 474 lakhs stated to have been spent to 31st July, 1926, gives the total cost of the reclamation at about 606 lakhs of rupees and without allowing credit for the sale of plant on completion of the sections of the work.

When investigating the scheme, I found there was no intention of covering the whole area with moorum one foot deep. That quantity was taken as a sufficient estimate to cover what would be required. Where clay was pumped from the harbour, no moorum would be necessary; on the other hand, in mud areas, the depth would be greater. Land to be built over would not require any moorum.

While land values are outside my province, I am impressed by the figures given in evidence. The cost of the work to date is stated to be 474 lakhs of rupees. The military area is approaching completion, for which the Government of Bombay is to receive 236 lakhs, which is at the rate of 20 rupees per square yard. This figure is the lowest value put upon the land by any witness. The area to be reclaimed is 1,145 acres, or 5,541,800 square yards. At Rs. 20 per square yard, the value is 11 crores. The gross project estimate, which it appears need not be exceeded, is, excluding interest, 770 lakhs.

ORAL EVIDENCE.

Chairman.—Are you now partner with Sir George Buchanan?
A.—I am.

Q.—In December, 1922, when you went to Bombay, what was your position in relation to the firm?

A.—My position was this. At that time I was Resident Engineer on the Lochaber water power works which were about to be commenced, and Mr. Meik put forward a proposition to me that I should join them in partnership. At that time I had that offer made to me, and while I had it under consideration they asked me to go out to India and also to Greece and inspect various works which they had in hand at that time.

Q.—Do you agree with Mr. Kidd that dredging on an open sea front is one of the most difficult, expensive and uncertain operations imaginable in engineering?

A.—It depends entirely upon the open sea front.

Q.—It depends on the extent to which you get tide and wind.—Is that it?

A.—That is right.

Q.—The tide proved a great difficulty at the outset, did it not, in this harbour dredging?

A.—Not on the open sea front.

Q.—In the harbour; that is my question?

A.—In the harbour.

Q.—Did not the tide prove a great difficulty at the outset in this harbour dredging?

A.—I have not been out again, I must say, since my visit in 1922. That was my only visit to Bombay. Therefore my information comes from the correspondence and from interviews with those who have been there. So that I have not seen the dredgers in operation, and therefore, of course, I cannot give my own personal opinion on the matter.

Q.—Is there a misprint at page 7 of your statement, where you say, " The increase in prices between 1912 and 1919 was from 10 to 20 per cent."?

A.—No.

Q.—There is not a misprint?

A.—No. It may not be quite clear as to what I mean there. I am talking about the cost of local labour and materials in the tropics on the works with which I was connected at that time. The increase in wages, and in the purchase of local material, such as timber and so on, amounted to between 10 and 20 per cent. between the period 1912 to 1919. In 1919, towards September, I should think, or possibly October, prices began to soar, and went up by quite 50 per cent. to 100 per cent. between the latter part of 1919 and 1921.

Q.—When you say " prices " are you confining yourself to labour?

A.—Labour and local materials. I am not talking about anything in this country, but only what took place abroad.

Q.—In order to clear up any misapprehension which might exist, we must just follow that up. The phrase in the statement is, " The increase in prices between 1912 and 1919 was from 10 to 20 per cent."—in India?

A.—This was not in India. It was in the Straits Settlements, where Indian labour was largely used.

Q.—After all, Back Bay is India, is it not?

A.—Yes.

Q.—The harbour is India?

A.—Yes.

Q.—The reclamation works are India. Is this meant to be an assertion that in India, which is the only place with which we are concerned, the increase in prices between 1912 and 1919 was from 10 to 20 per cent?

A.—No. What I wish to bring forward here is that during this critical period of 1919 to 1921 I myself was in charge of the construction of large public works——

Q.—One moment. Let us keep to 1912 to 1919 first of all. Does this statement of yours—that the increase in prices between 1912 and 1919 was from 10 to 20 per cent. —apply to India?

A.—This is not stated with reference to India.

Q.—Does it apply to India—yes or no, please?

A.—My figures here——

Q.—Mr. Halcrow, does it apply to India? Tell me yes or no?

A.—That I cannot say.

Q.—But you are the author of this document?

A.—Yes.

Q.—You come here putting this document forward. Tell me yes or no, does that apply to India?

A.—I cannot say whether that applies to India or not. It applies to work on which I was engaged at that time.

Q.—Then, as regards this statement of yours, although you have included it in a report dealing with India and India alone, you say that you do not know that it applies to India?

A.—That is so.

Q.—Now you go to Bombay, and you say the dredger " Sir George Lloyd " had arrived in Bombay in time to commence dredging in the season 1922-23. By that you really mean that she had arrived physically in Bombay in March, 1922. That is all you mean, do you not—that she was there?

A.—She was there.

Q.—There is no doubt about it; it was one of the unfortunate matters in this case. " Had arrived in Bombay in time to commence dredging in the season 1922-23, and the state of the works at that time was such that there did not appear to be any reason why the commencement should not have been made in that season." By that you mean " Why the dredging should not have been commenced in October or November, 1922," do you?

A.—Yes.

Q.—Will you please tell me how much of *this* wall had been constructed in October, 1922? (*Indicating on plan.*)

A.—At that time I think there were——

Q.—Mr. Halcrow, you have made a definite statement?

A.—2,000 feet; I have it here.

Q.—2,000 feet had been constructed. That was the position?

A.—Yes.

Q.—How much of *this* cross-bund had been constructed?

A.—That had not been constructed.

Q.—How much of the storm water drain had been constructed?

A.—That had not been constructed.

Q.—How much of *this* little storm water drain had been constructed?

A.—That one had not been constructed.

Q.—Then will you tell me please, what becomes of your statement that there did not appear to be any reason why the commencement should not have been made in that season?

A.—The opinion that I formed was this—and it can only be an opinion, having gone round the works there, namely, that had the line of railway which takes you out from Colaba to the end of the wall there been arranged in another way, they would have had an area there which would have contained anything up to, perhaps, a figure of about 1,000,000 cubic yards of material, which in my opinion, it would have been worth their while to commence in that season.

Q.—A million cubic yards?

A.—Yes. True, it is a small quantity, but I formed that opinion at that time—that it would have been worth while——

Q.—It is one-thirtieth of the whole amount to be deposited?

A.—I think one-twenty-fifth.

Q.—Well, say one-twenty-fifth. To retain the material, there would have had to have been a cross-bund?

A.—Yes. That was formed in taking the railway out to the wall.

Q.—Where is that shown?

A.—In the corner there.

Q.—Do you really mean it would have been a good business proposition to reclaim *this* little bit?

A.—Down at the end *there*.

Q.—Will you come to the plan and show us what you mean?

(*The witness indicated on the plan.*)

A.—The point I had in mind was this. They carried this railway right away down *there* and took it to the end of the 2,000 feet wall there. I am expressing the opinion that if they had come down further over *here* and joined *there*, they would have had *here* an area which it would have been worth their while to have pressed ahead with.

(*The witness proceeded further to explain by means of the plan.*)

Q.—We have to get this on the shorthand note. The blue line is railway?

A.—Yes.

Q.—When you arrived there you found that railway in *that* position?

A.—Yes.

Q.—That was an accomplished fact?

A.—Yes.

Q.—You say, however, that if, some months before, it had occurred to them to bring the railway down along *this* green line, somewhere in *that* direction, they would have enclosed a larger area?

A.—Yes.

Q. Does it occur to you that the depth along this green line might have been considerably greater than the depth along *here*?

A.—It was not considerably greater.

Q.—At all events, the fact, as you found it, was *this* railway running along *that* blue line?

A.—That is so.

Q.—Then will you tell me, with the facts as they were, and with only 2,000 feet of wall built, with no retaining cross-bund and no storm water drain, how it was possible to begin the dredging in the season of October-November, 1922?

A.—I am endeavouring to describe my visit there and what I learned when I was out there. If it is superfluous in my statement, I shall take it out altogether.

Q.—It is not that. You are here as an expert witness, and you say there did not appear to be any reason why the commencement should not have been made in that season?

A.—Yes, had the works been otherwise arranged.

Q.—What is that?

A.—Had the lay-out of the work been otherwise arranged. That is what I mean when I say that here.

Q.—If the Development Directorate had done constructions differently from what they have it might have been possible to pump in October, 1922?

A.—Yes.

Q.—Naturally, if they had built a cross-bund; if they had built a storm water drain and if they had built a sea wall, they could have begun in October, 1922. But dealing with the hard facts as they were, with only 2,000 feet of wall completed, and no storm water drain, and no cross-bund, pumping could not have begun in October, 1922?

A.—Not as they had it there, no.

Q.—That is right; we understand each other. You say at page 2, " I was particularly anxious to see the detailed programme for working the dredger plant, but failed to obtain any information as to whether a programme had been prepared or not." I do not understand that. If you had asked a plain question, must you not have got a plain answer?

A.—That is what I expected, but I did not get it.

Q.—But it is only a matter of perseverance?

A.—I persevered, but in asking these questions I was asking them of a man who, in my opinion, was a very sick man.

Q.—Surely he was not too sick to answer this question : " Have you got a dredging programme." He was not too sick to be asked that, was he?

A.—He would not answer that question.

Q.—What would he have done? Would he have fainted?

A.—I asked him the question, and I could not get a direct reply.

Q.—Did you study any of the papers in the office before you went out?

A.—The papers I studied——

Q.—Answer the question. Did you study any of the papers before you went out, is my first question?

A.—I studied certain papers.

Q.—Amongst them did you notice the dredging programme prepared in Sir George Buchanan's office, of April, 1921?

A.—No.

Q.—In fact that dredging programme was in the office of the Development Directorate at the moment, but you say that notwithstanding all your efforts you could not get any information from anybody as to whether there was a dredging programme in existence?

A.—Other than *this* programme.

Q.—What is that document?

A.—This document is described as the project estimate. That is the only document I had. I knew of no other programme. I wanted the elaboration of *this* programme.

Q.—Certainly. We all understand. What you wanted was the dredging programme?

A.—The elaboration of *this* programme.

Q.—And especially, I suppose, the work that the dredger was going to do as soon as she was put in commission?

A.—You mean the output?

Q.—Especially the work that the dredger was going to do—where she was going to dredge?

A.—Exactly.

Q.—The length of the pipe line; the position of the shore line; the position of discharge. All those matters you wanted?

A.—Yes.

Q.—It is Mr. Lewis you are referring to?

A.—I am referring to Mr. Lewis.

Q.—Mr. Lewis was too ill to explain to you whether or not they had any dredging programme?

A.—That is so.

Q.—That was in October, 1922. In those circumstances did it not occur to you that you should have cabled home to Sir George Buchanan at once? Was Sir George Buchanan in India?

A.—Sir George Buchanan was there I must explain, during the whole time of my visit.

Q.—Did not you at once hurry off to Sir George Buchanan and say to him "I cannot even get from Mr. Lewis whether there is a dredging programme"?

A.—I did.

Q.—"And the whole thing is going to collapse"?

A.—No, I did not say the whole thing was going to collapse.

Q.—You did not think that?

A.—No.

Q.—Had you confidence in Mr. Lewis?

A.—I had never met Mr. Lewis in my life before.

Q.—Had you confidence in Mr. Lewis.

A.—I could not express an opinion of a gentleman whom I had never met or knew nothing of before.

Q.—How long were you seeing Mr. Lewis—for how many weeks?

A.—I was there from the 1st December, 1922, to the 20th January, 1923, and I saw him many times during that period. I went to his office and had interviews with him.

Q.—Having seen him many times are you not able now to express an opinion about him?

A.—My opinion is that he was not in a fit state of health to be carrying on the work.

Q.—That was October, 1922—fifteen months before the dredger began to work?

A.—In December.

Q.—In December—January—twelve months before the dredger began to work?

A.—Yes.

Q.—Did you urge upon Sir George Buchanan that Mr. Lewis ought to go?

A.—In my opinion——

Q.—Did you urge upon Sir George Buchanan that Mr. Lewis ought to go? That is the question.

A.—That he should have leave. I did not suggest to Sir George Buchanan that he should go. I suggested that a man in his condition of health, as I saw it, should have a prolonged leave.

Q.—With all this terrible expenditure of money we cannot afford to indulge in sentiment. We have to look at the thing brutally.

A.—Absolutely.

Q.—Mr. Lewis was the representative chosen by Sir George Buchanan. Sir George Buchanan vouched for him, did he not?

A.—He chose him.

Q.—He vouched for him?

A.—By choosing him.

Q.—Exactly. Nobody can avoid feeling ill. Your opinion in December, 1922, was that Mr. Lewis was a man too ill to do this responsible work. That is right, is it not?

A.—That is so.

Q.—And you urged that upon Sir George Buchanan. You appreciated, of course, that if the work was a failure, the very presence of Mr. Lewis there would, to some extent, involve Sir George Buchanan?

A.—I do not quite see that point.

Q.—Would not people turn round and say, " Well, this work has been a failure. It has been a failure partly because Mr. Lewis was not a big enough man for it. Sir George Buchanan appointed him." In that way it would reflect upon Sir George Buchanan, would it not?

A.—I do not know that it would. I do not see that point at all.

Q.—Very well. There is another and wider aspect of it altogether, and that is that Sir George Buchanan was the technical expert adviser to the Government, was he not?

A.—He was engineer for the work—technical adviser for the work.

Q.—With a responsibility to communicate to the Government anything that he considered of importance?

A.—Yes.

Q.—Was the state of Mr. Lewis's health a matter of the greatest importance?

A.—I consider it was a matter of importance. Mr. Lewis had, of course, a senior over him, but at the same time, as far as I could see, he was the executive in charge of the work.

Q.—He was the resident engineer?

A.—And he therefore should have been a man in the very best of health.

Q.—Exactly. When you urged upon Sir George Buchanan that Mr. Lewis ought to have long leave, what did Sir George Buchanan say about the matter?

A.—He quite agreed.

Q.—Did he go off to the Governor at once?

A.—I cannot say what he did.

Q.—Do you know whether he did?

A.—I do not know.

Q.—Do you think he did?

A.—I believe he took the matter up with the Government, but I have not the papers on that matter with me.

Q.—Do you agree that the increase in prices of plant and material between 1912 and 1919 was at least two-and-a-half times?

A.—In England?

Q.—Yes, in England?

A.—Yes, about two-and-a-half times I should put it roughly.

Q.—We have had figures given us by Colonel Paddon which have all been set out in detail. He thinks two-and-three-quarters times. Sir George is willing to go to two-and-a-half times. Had you any previous experience of reclamation on an open sea front in 1922?

A.—I have had experience.

Q.—Where was that?

A.—During my service with a firm in which I am now partner, which commenced between 25 and 30 years ago. There passes through my mind two works carried out in that time involving sea walls with reclamation behind, and during the period I was with contractors, amounting to about 10 years, there was a reclamation carried out which involved the construction of a rubble mound and reclamation behind it, also on the sea front.

Q.—With suction dredgers, or bucket dredgers?

A.—In that case the dredger was a bucket dredger with a shore pumping station. The material was actually pumped into the reclamation behind the wall.

Q.—You had a bucket dredger, and what we might call a booster?

A.—No, not a booster—a shore pumping station.

Sir Frederick Hopkinson.—The dredger dredges the material, and it is put into barges, which are taken alongside the wall, and it is pumped from there on to the reclamation.

Chairman.—Was that how it was done?

A.—Yes.

Sir Frederick Hopkinson.—It was not clay or sand?

A.—It was river silt and mud.

Q.—Sand?

A.—Not sand.

Q.—Not clay?

A.—No; river silt and mud.

Q.—Silt?

A.—And mud.

Sir Frederick Hopkinson.—Silt contains mud.

Chairman.—I am only asking you that, because I see that you have expressed an opinion about the price of reclamation. Do you remember that, on page 29 of the report, Sir George Buchanan estimates that the dredging will cost 8 annas a cubic yard?

A.—Yes. 8 annas a cubic yard, I think, is his price.

Q.—Do you approve that figure?

A.—I approve that figure.

Chairman.—Would you mind just taking down a figure or two? Would you put down £732,000. That is the price of the " Sir George Lloyd ", the " Colaba " and the pipelines. Would you put down £180,000; that is the price of the " Kalu," her repairs and her pipeline. Would you put down £10,000, which is the price of the " Jinga ", and you might put down £10,000 for her repairs, as she has been in dock for about 16 months.

Sir Frederick Hopkinson.—I think you can put down £40,000 for that.

Chairman.—Is that your view, Sir Frederick, that that is what the " Jinga " is going to cost?

Sir Frederick Hopkinson.—Something like that.

Chairman.—(*To the Witness.*) Put down £40,000 for that. Will you add all that up. How much does it come to?

A.—£952,000.

Q.—Will you tell me how many 8 annas there are in £952,000?

A.—I am afraid I must have misunderstood your question. I thought you were referring me back to the 1919 estimate.

Q.—We are coming to that in a moment. Would you tell me how many 8 annas there are in £952,000, or would you like me to do it for you? I will do it in two ways for you. Am I right in thinking that, if you take Rs. 15 to the £., the amount is 28,560,000 8 annas in £952,000?

A.—I do not make it the same figure, but I will accept your figure for the purpose.

Q.—I want to get it right. There are 28,560,000 8 anna pieces in £952,000. Now if you take Rs. 12 to the £ you will find there are 21,848,000 8 anna pieces in £952,000. Sir George was proposing to dredge 25 million cubic yards, was he not?

A.—25 million cubic yards is the figure in his report, yes.

Q.—He had exhausted all his 8 annas in the plant, had he not? It had all gone?

A.—I am afraid I cannot quite see that, because the figure which you have given me at the present moment, as I understand, is the actual cost of the plant?

Q.—Yes.

A.—His report was based—

Q.—On his estimated cost of the plant.

A.—Which was based on an estimate by a dredger builder in 1919

Q.—So be it.

A.—And the figures, as far as I have gone through this report, set out here that the charge of the plant amounts to 3·92 annas, based on an actual estimate made by the firm of dredger builders.

Q.—Quite so, and then, if there was an under-calculation on the estimate of plant required, we know that the actual fact is, as set out in these figures, that that dredging plant—the " Sir George Lloyd," the " Colaba," the " Kalu," the "Jinga," pipeline and accessories—came to £592,000. That being so, the whole of the 8 annas is exhausted in the mere purchase of the plant, is it not?

A.—Undoubtedly—the price that the plant actually cost. It cost two or three times as much as it would have cost in 1919 owing to the rise in prices in this country after the war.

Q.—You are not quite exact about that, but still. You say that the working cost of dredging a cubic yard of material from the harbour or Back Bay and putting it into the reclamation will be 8 annas, do you not? You agree?

A.—You are now talking about Sir George Buchanan's report. Is that right?

Q.—I have now got on to page 8 of your report on which you say : " I feel disposed to accept the figures given by the deputy Chief Engineer, Dredging, in evidence as to the present cost, that is, 8 annas per cubic yard. This cost is the result of working the dredgers." If it is going to cost 8 annas per cubic yard—and assume for the moment that 21 million yards still have to be reclaimed—you are going to spend another £800,000 on the mere working cost alone, are you not?

A.—That is 8 annas by 21 million cubic yards?

Q.—It is 21 million 8 annas?

A.—Yes. I was just looking back to see what I made it on the basis of 7 annas.

Q.—Rs. 10½ million.

A.—I take that figure.

Q.—Rs. 10½ million is rather a staggering amount, is it not?

A.—Compared to the quantity to be dredged, I do not think so.

Q.—Compared to Sir George Buchanan's estimate that the whole of the work could have been done for 367·61 lakhs?

A.—Had it not been for the increase in prices from 1919 onwards.

Q.—But Sir George disputes it. He is willing to accept it with some reservation that the price went up to 668 lakhs in February, 1922. If you are paying £952,000 for your dredging plant; £350,000 for your other plant; if you are going to pay Rs. 10½ million to reclaim the remaining 21 million cubic yards— those three sums are out of all proportion to the 367 lakhs, are they not?

A.—I do not agree.

Q.—Would you like me to take you through the arithmetic?

A.—My whole point is this, as far as my evidence can go—that looking back on Sir George Buchanan's estimate, 1919, I know from my own experience of works during the subsequent years that there was a very great increase in prices all round, and therefore any estimate made in 1919 must, in my opinion, be increased by at least 50 per cent. to give a proper idea of what the work would actually cost.

Q.—Increase it by 50 per cent. 50 per cent. on 367 lakhs brings it up to about 550 lakhs?

A.—Yes.

Q.—Take 550 lakhs. Sir Frederick Hopkinson has pointed out to me that if your figure for dredging cost is right, 8 annas per cubic yard——

A.—Not my figure. I am taking this figure from the deputy Chief Engineer's evidence—this figure of 8 annas per cubic yard.

Q.—Mr. Halcrow, you have put your signature to a document in which you say "I feel disposed to accept the figure."

A.—I feel disposed to accept it.

Q.—And I feel disposed to ask you, under the circumstances, whether the estimate of 367, even if increased by your 50 per cent. to bring it up to 550—whether that estimate of 550 lakhs was not a ludicrously low estimate in view of what has been found to be the necessary cost of the work—a ludicrous estimate?

A.—I do not agree.

Chairman.—I have nothing more to ask you.

Sir M. Visvesvaraya.—May I ask what you propose to establish by this note? What are the main points you want to put forward for the consideration of the Committee?

A.—I say for the consideration of the Committee, from my visit to Bombay I formed the opinion there that as far as the wall work was concerned they were doing the work pretty well. I have been accustomed to contractors' methods, but their methods were strange to me. Making allowance for conditions I did not understand, I thought the wall was getting along fairly well. At the same time I formed the opinion that they had been rather extravagant in the provision of plant for the work, and I could have done the work with less plant myself. There were various items of organisation there with which I became acquainted which were strange to me. They did not appear to have much co-ordination amongst the senior members of the staff. These are the impressions I formed when I was out there.

Q.—I understand you are making some definite recommendations or suggestions in this statement?

A.—In the light of what has happened since 1924 my personal opinion is that it is very much better that the work should be completed on a contract basis.

Q.—It can be completed on the estimate already sanctioned?

A.—I have taken the figures which have appeared in the evidence, not having any other figures to go on.

Q.—The evidence is of various kinds. Some people say one thing, and others say another. If you accept one person's view and calculate on that only you may get a certain result.

A.—I think it is very difficult, but on page 16 of my notes you will see what I say. The figure for last year's working of the dredger was, I believe, 1,800,000 yards for the "Sir George Lloyd," and they state that they were only working 16 hours a day instead of the customary 24. By working 24 hours that would put that figure up to 2¾ million cubic yards, without increasing the intensity of the volume, if you follow me,—simply at the pace at which they have been carrying on. That brings it up to 2¾ million cubic yards per annum; but in my opinion, that output can be greatly increased—in fact, the members of the Development Department who are carrying out the work say so themselves. They say in their evidence that they could increase it. Then as regards the "Kalu" working in Back Bay, she is reported to have dredged last year 338,000 cubic

yards in 2½ months. In six months, I take it, she could do 800,000 cubic yards, and if put on full working time it would bring it up to 1,200,000 cubic yards. Adding those two figures together without allowing for any improvement in intensity of output due to organisation, those vessels could dredge 4,000,000 cubic yards in the season.

Q.—Have you also seen the evidence given by Mr. Spiers when he says you cannot work it in the same way at night time—you cannot do as much work at night time as in the day time?

A.—I must disagree with Mr. Spiers. My experience of dredging in works I have been connected with is that they have always worked 24 hours a day in two shifts, either 132 hours or 144 hours per week. It is either 5½ or six day of two shifts.

Q.—Contractors work that way?

A.—Contractors always work 24 hours a day, and it is very well known to the staff out there. They know that very well indeed. They are men with experience on the staff of contractors. They have had experience with eminent firms of contractors.

Q.—Then why did not they themselves suggest working 24 hours?

A.—That is absolutely beyond me. I cannot understand it.

Chairman.—We asked the same question.

A.—Yes. To me it is inexplicable altogether. I do not understand why they did not start right at the beginning.

Sir M. Visvesvaraya.—It may be because they did not want to take the trouble of making the work.

A.—It may be that. I do not know what the reason was. It is a fact that they know it, because I personally know the deputy dredging engineer, and I know that for years he was engaged on a dredging contract in this country where they worked 132 hours per week. In fact, I considered that is so important that I put it in my statement.

Q.—You have taken all the favourable items from the evidence and developed this note?

A.—I hope I have not taken the most favourable items, because I think in the evidence the deputy dredging engineer says he could get 2,000 cubic yards an hour out of the " Sir George Lloyd "—for a month, I think he said.

Chairman.—Will you show us where, because we should like to see that? The " Sir George Lloyd " did something reasonably well when she got into an extremely favourable patch of soft clay and soft mud. If you can show us that in the evidence we should be glad. We want to find what is your authority for your statement about the " Kalu " doing a certain dredging output, and the statement on the last page of your statement here. We would like to see that in the evidence, and where it comes from.

A.—I have not got a copy of the evidence.

Sir Frederick Hopkinson.—You say on page 16 that the " Kalu " is reported to have dredged 338,000 cubic yards in 2½ months.

A.—Yes.

Q.—Where does that report come from?

A.—Speaking from memory, it comes from Sir Lawless Hepper. I shall have that searched for.

Chairman.—Would you kindly look up that point about the " Kalu," and let us have it within the next two or three days?

A.—Certainly I will do that. I shall endeavour to let you have it before then.

Q.—There is the point about the " Kalu," and the point on page 20 : " The Development Department staff have admitted this to the Committee." " The dredger ' Sir George Lloyd ' if properly handled can give her designed output in the material in the harbour "?

A.—Yes; I can find that also.

Q.—Do you mean by that that some one witness has said that? Do you mean a witness like Mr. Brims has said : " I think she could give her output." Is that what you mean by the Development Department staff have admitted this?

A.—That is right.

Q.—You mean some member of the Development Department staff has said it?

A.—One of the senior members, I think it was. Probably the deputy chief engineer in dredging, I think they call him.

Q.—Mr. Brims?

A.—Yes.

Q.—We will have a look at that.

A.—Yes; that is it.

Sir Frederick Hopkinson.—The maximum they told us they could possibly hope for from the dredger this season was 1,600,000 yards, and that is what they were going to base their calculations on.

A.—Really.

Chairman.—There is some mistake about this, you will find. Mr. Brims may have made some statement like that, but if you look at the whole of Mr. Brims' evidence you will see that it obviously does not bear it out. We want to know about the statements on page 16 and page 20 of your note.

A.—Yes; that is the "Kalu's" output of 338,000 cubic yards, and Mr. Brims' statement that 2,000 yards an hour can be obtained from the "Sir George Lloyd."

Sir Frederick Hopkinson.—He is the man who is responsible for getting 2,000 yards. Why should he say that he could get 2,000 yards in the future when he has never been anywhere near it in the past? Can you understand that?

A.—It is difficult to understand.

Q.—It is impossible to understand. He is paid to do it.

A.—I have put my views in here, and I will not allude to that.

Q.—You do not think he is hanging up a flag to say: "I am paid to do 2,000 yards, and I can only do half that."

A.—I do not know.

Sir M. Visvesvaraya.—On page 1 you say: "The firm had to invite tenders and examine and report to the India Stores Department upon the tenders for any plant which the Development Directorate desired to purchase in this country." I suppose you recommended which tenders should be accepted in every case?

A.—That is right.

Q.—This was the only occasion which you visited the works in Bombay—in 1922?

A.—That is the only occasion, 1922-23.

Sir M. Visvesvaraya.—On page 2 you say: "I was particularly anxious to see the detailed programme for working the dredging plant, but failed to obtain any information as to whether a programme had been prepared or not." You say you did not ask for a programme?

Chairman.—He said he did ask, but could not get an answer.

Sir M. Visvesvaraya.—Did you ask officially and get a reply?

A.—This was an interview with the chief engineer.

Q.—I think he has said he was not asked, but you have a recollection that he was?

A.—I can only put down here the result of my interviews, because Sir George Buchanan was in Bombay, and, of course, I was only there as one of the staff of the firm.

Sir Frederick Hopkinson.—If you told Sir George Buchanan that they had not got a programme at that moment, surely he would have turned round and said: "But I made one myself and sent it out last year"? He sent out a full programme in April, 1921, for the dredging operations.

A.—I do not recollect any conversation on those lines. I am speaking now entirely from memory of four years ago.

Sir M. Visvesvaraya.—You may send out programmes, but did you see in your office that the programmes were being given effect to?

Chairman.—At that time, in 1921, he was not associated with the work.

A.—Before October, 1922, I may say I knew nothing whatever about the Back Bay work at all. I was engaged on other works in other parts of the world. I merely knew that that work was going on, and that is all; so that I am not able to speak of anything before that date.

Q.—Subsequently have you been sending out programmes from your office and insisting upon their being observed on the spot? Did you send out programmes, or did you suggest to the engineer, or discuss with him, programmes for adoption?

A.—I wish to make my position in connection with Bombay quite clear. Sir George Buchanan was either out in Bombay or he was back in this country. When he was in this country he dealt with all these matters. From time to time he may have discussed matters with me in order to obtain my opinion on one point or another.

Q.—Did you follow the correspondence?

A.—I have not necessarily followed the correspondence because I have my own work to do and my own clients to attend to, and I dealt with matters of Bombay when Sir George Buchanan wished me to. If perchance he was not in England then I would have to deal with the matters in detail.

Q.—This is a very important point, as to whether you were sending out programmes for the execution of the work, and whether they were being acted on by the people on the spot.

A.—The only definite case which I can remember that I myself had looked into was the question of dredging in Back Bay. In that case what happened was, I think, that Mr. Brims was appointed as dredging engineer, and before he went out I showed him my ideas as to how the Back Bay dredging could be tackled. Actually they did not adopt that suggestion.

Q.—Passing on to page 6, you have made this statement: "I learned that the senior members of the Department did not avail themselves of his knowledge and experience "—that is as to Mr. Settle?

A.—Yes.

Q.—Did he give his knowledge and experience in writing?

A.—When he was out there he told me that for the most part he was left—I do not know that I should tell you very much what he told me because he is going to give evidence, and it is better that I should not repeat what he said to me; but it has an important bearing on it.

Q.—" I learned that the senior members of the Department did not avail themselves of his knowledge and experience."

A.—He will explain all that.

Q.—On page 8 you say: " It is difficult to believe that the dredging cannot be carried out at about the rate of five annas estimated by the Development Department themselves, working full time." So that you are of opinion that they can do the dredging at 5 annas even now?

A.—It is based on this—that they have been working the dredgers 16 hours a day instead of 24 hours. It will lessen the cost at once when they work 24 hours.

Sir M. Visvesvaraya.—When you say that the dredger works 16 hours, does not it mean that it works sometimes 18 or 20 hours, and sometimes 20 to 22 hours, and the time they do the pumping is 15 hours?

Chairman.—No; 11 hours, 40 minutes.

A.—When I talk about the working time of the dredger I am talking of the gross working time, not the net actual pumping time which was estimated, as I see in Sir George Buchanan's report, at 15 hours per day. You may take it that I would expect to work 24 hours a day in order to get 15 hours net.

Sir M. Visvesvaraya.—They were working longer than 15 hours already.

A.—I understand that they are working 15 hours a day

Q.—Probably due to stoppages—they have not been working very satisfactorily—the number of hours' work is 18 to 20 hours, they told me.

A.—Really, I was not aware of that.

Chairman.—The average pumping rate is 11 hours, 40 minutes for the last season.

A.—That is the actual pumping time?

Q.—Yes.

A.—That is out of what?

Q.—It does not matter what it is out of. The fact is 11 hours, 40 minutes was the net pumping time.

A.—Very well.

Sir Frederick Hopkinson.—Even then that ought to have given twelve-fifteenths of 2,000 yards an hour.

Sir M. Visvesvaraya.—Did you see any of the clay when you went there?

A.—When I went there, they brought up a small sample from the bed of the Harbour.

Q.—15 hours pumping time you calculated as the average number of hours pumping time?

A.—Which 15 hours is that?

Q.—It is on page 10: " Two points only need be mentioned to prove mishandling: (1) the dredgers had not, even by the end of the second working season, been put on their full working time of 24 hours a day "?

A.—That is in order to get 15 hours' pumping time a day—actual pumping hours.

Q.—Had you advised them at any time that they should work 24 hours a day before that date?

A.—Before which date?

Q.—Before they commenced the operation?

A.—I personally advised them about it? I had no authority—I have no recollection of it.

Sir Frederick Hopkinson.—When you were out there in 1922, did you not give them instructions that they ought to work 24 hours a day?

A.—I personally did not.

Sir M. Visvesvaraya.—When did your firm advise full working time of 24 hours a day for the first time?

A.—These matters are all dealt with by Sir George. He was actually there giving advice.

Chairman.—He says Mr. Brims went out with definite instructions to work 24 hours a day.

Sir Frederick Hopkinson.—That was in the very early days. From that time there is no reference, I believe, in any letter or correspondence of any kind that they were to work 24 hours a day.

Chairman.—I do not think this gentleman ought to be asked about these matters. These are all foreign to him. That is how Sir George puts it, and no doubt it is quite right. Mr. Brims was told to go out and do a working day of 24 hours a day, which he never did. Sir Frederick says there is a curious silence in the correspondence about it afterwards; but you would not know anything about that.

A.—No. It might help to get matters through more quickly if I mentioned the points which do appeal to me very much.

Sir M. Visvesvaraya.—Certainly.

A.—In February, 1925, when Sir George did not come home as he usually did after his visit to Bombay, I felt it incumbent upon me to look into the matter of dredging. I went through the reports which were sent down. I waited a week or two to see whether there was any direct improvement as a result of Sir George Buchanan's visit out there. I found there was no improvement, and therefore I addressed a letter to the Development Directorate asking for an explanation why the dredgers were not getting the specified output. At the same time I asked them—it was rather a bow at a venture—to let us know what bonus terms they had arranged with the crews. The reply they gave us was that they had not arranged any bonus terms with the crew at all, although they were then in their second season of dredging.

Sir Frederick Hopkinson.—The third season, was not it?

A.—The second season.

Q.—When Sir George went to Australia it was the third season?

A.—No, the second season.

Chairman.—It is 1923-24 and 1924-25; and then Sir George goes to Australia. 1923-24 is the first season of dredging?

A.—Yes.

Q.—1924-25 is the second season?

A.—Yes.

Q.—It was on January 7th that Sir George Buchanan went off to Australia, in the middle of the second season?

A.—That is right.

Q.—Then he being absent, you took the matter up?

A.—He being absent I took the matter up at that point. As I have just said, I found that they had not got any of their crews on the basis of payment by results. To my mind that is a terrible thing. I do not know that I can say more. Letters were exchanged. They admitted openly that they did not have the dredgers on the bonus. When Mr. Brims came home on leave the following summer and came to see me, I asked him particularly about that point and said: "Have you ever known of the case of a big dredging contract being carried out without payment by results?" And he said "No."

Sir M. Visvesvaraya.—On page 16 you say: "Viewing the dredging as a whole, notwithstanding the methods adopted by the Department in handling the plant, they had accomplished about 4,000,000 cubic yards of filling out of a total of 25,000,000". That 4,000,000 cubic yards is in three years?

A.—Yes.

Q.—As against 15,000,000 expected?

A.—Expected from the plant, yes; but not so much as from their own project estimate. Owing to Sir George Buchanan's personal representations, they started a year earlier than they intended. From their estimate they intended to start in the year 1924-25 and to do 10 per cent. of dredging.

Sir Frederick Hopkinson.—Mr. Lewis said they intended to start in 1923. He said distinctly: "Not an ounce will be done before December, 1923"?

A.—I am referring to the programme of work.

Q.—I am referring to the letter. What is it you are referring to?

A.—To the long statement which is entitled " Programme of working and probable annual expenditure "; and under the year 1924-25, item 12 dredging 10 per cent.; and in the year 1925-26, 20 per cent.

Mr. Billimoria.—Actually Sir George Buchanan told them they ought to begin in 1922, and Mr. Lewis replied: " Not an ounce will be done before December, 1923 ".

Sir Frederick Hopkinson.—That was subsequent to that.

A.—Subsequent to this programme?

Q.—Yes, that programme was in course of preparation for twelve months. It may have been in the last month of the 12 months that they put that in. That has no value at all.

A.—Well, this is the document that I have always gone by.

Q.—It is of no value at all?

A.—So far as my connection with the work is concerned, it is their final programme.

Sir M. Visvesvaraya.—You advise 24 hours' work?

A.—Absolutely.

Q.—Would you do it in two shifts or three?

A.—My experience has been in two shifts, but that is a matter of detail. Some people prefer to work three shifts.

Q.—Then on page 17 you say: " The firm were appointed Engineers. They prepared plans and specifications of the permanent work in accordance with the practice of the profession and inspected the carrying out of the work ". You have a definite understanding, according to your contract with the Government. The contract requires you to perform all works and duties devolving upon Engineers of large works such as the final provision and inspection of estimates and prices and tests and also trials of dredgers. In fact the final inspection and supervision of the tests and trials of the dredgers were not attended to. The trials of the operation of the dredger have not been attended to. I do not know whether you know that? The firm prepared the original estimate; but what else did you do in the way of preparation of plans and estimates after the original estimate? Is there any document comparable with that report prepared at any later stage, or any important work that your firm did in the matter of reporting on plans and estimates after this report was submitted? Do you follow me?

A.—I have not quite caught that.

Q.—This report was first submitted in 1919?

A.—Yes.

Q.—After that is there any report submitted by your firm or by Sir George Buchanan comparative with this?

A.—To the Bombay Government?

Q.—Yes, any important plans or estimates, or any report like this?

A.—The plans which I have seen were working plans for the wall and specifications as to what had to be done.

Chairman.—And Sir George Buchanan's annual reports?

A.—Yes.

Sir M. Visvesvaraya.—But the specifications of the wall were not adopted on the spot. The engineers there did not follow exactly what was described there?

A.—To a certain extent they departed from the specification, but in the main I should say not.

Q.—In the main they adopted them?

A.—In the main, yes, but there were certain details in my opinion in which they were not adhering strictly to the specification.

Q.—Then on page 18 you say: " Sir George Buchanan has dealt with this matter in his statement. Personally I should have preferred that the firm had had a separate Resident Engineer under their direct control "?

A.—Yes.

Q.—To faithfully carry out the terms of the contract, would it not have been necessary to have a separate Resident Engineer of your own on the spot?

A.—I think not, from what I recollect of the contract.

Q.—Measurement and inspection—all the work that is usually done by the engineers. It is stated here in the contract that your firm is expected to do all the work which engineers reckon to do on a work of this kind?

A.—Yes.

Q.—Without a Resident Engineer, how could you do it?

A.—As I found things when I got there and had the position explained to me, the position was that the Resident Engineer really had a dual position. That is why I state here that I did not like it.

Q.—Should not you have had a separate Resident Engineer?

A.—That point was discussed when I was in Bombay, and I believe Sir George Buchanan has dealt with that in his statement. In fact I have seen that he has, as I have read it. He refers to meetings which took place out there at which the Government said: "Why do not you have your own Resident Engineer?" He said he was perfectly willing to have his own Resident Engineer.

Q.—But they would not pay for the man?

A.—No.

Q.—On page 19 you say: "The former"—that is the sea-wall—"is over 90 per cent. completed and the design has proved to be satisfactory. The latter is 16 per cent. completed, and, as I have endeavoured to show above, there does not appear to to be any physical reason why the remaining dredging should not be done with the plant available within the time estimated by the Development Directorate, namely, the summer of 1931." You say: "There is no physical reason." Yesterday Sir George Buchanan stated that you can bring the work to a triumphant conclusion if regard is not had to the cost. In both these cases you do not go into the question of cost at all?

A.—You mean as to whether the Government should spend the money in completing the work?

Q.—Yes?

A.—I do not express any opinion on that at all. From the figures I have given on another page in my statement I have endeavoured to show that, without any increase in the intensity of the work of the dredgers, that is to say, which would be obtained by the payment of proper bonuses to the men, in my opinion they can carry it out within that programme which they themselves have prepared ending in 1930-31.

Q.—You have assumed certain figures and made calculations and shown that, if I may say so without seeming discourteous, to your own satisfaction?

A.—I will not say to my own satisfaction at all. I myself would like to see them greatly improved upon; but I have taken the figures from the evidence for the working of the dredgers in 1926.

Q.—You have not taken account of the fact that you cannot dredge on the middle blocks. You cannot send the stuff to the middle blocks 1 and 2. You cannot pump that distance with the present plant.

A.—Really?

Q.—The Engineers on the spot say so, and everybody says that.

A.—I have not gone into that. I quite understood that the plant was provided for the whole work.

Sir M. Visvesvaraya.—Your statement is too optimistic almost to be discussed.

Chairman.—You cannot treat this seriously?

A.—Yes, I think so.

Q.—Are you treating it seriously?

A.—Yes. I should be sorry if it would not be treated seriously.

Q.—I am sorry to have to express the opinion, but it is so utterly optimistic, and flies in the face of all the evidence we have heard in Bombay, that it seems to me it is a mere academic hopeful opinion.

A.—I have taken the figures from the evidence which has been given.

Chairman.—I agree.

Sir Frederick Hopkinson.—In other words, you have done the dredging in this room, or in your own office.

Chairman.—As a practical proposition, it is no good.

A.—I have endeavoured to be fair by taking the figures from the evidence given. I have not put what I thought ought to be done. I have not even assumed that they could do more than 1,000 yards an hour, which they have been doing with the dredger. I have taken the figures they have given and divided it up into the work done.

Q.—Multiplying it by one or two things?

A.—I think not, only 24 hours against 16.

Sir M. Visvesvaraya.—Will you pass on to page 20, where you say: "The action to take would have been to refer the matter to the engineers for the work for their opinion and report"? Did your firm ever give anywhere a detailed estimate themselves? You say that they should have submitted for your consideration the working out of the estimate?

A.—Yes. I see what you mean. I understand this is the estimate of the Advisory Committee?

Q.—Yes. You say you wanted that estimate to be sent to you for criticism?

A.—I think they should have submitted it to Sir George.

Q.—There has been criticism enough. What they wanted was constructive work. Why did not you go there and prepare estimates and hand them over?

A.—This is historical so far as I am concerned. It is before 1923. I understand that Sir George did prepare an estimate.

Chairman.—There is only 5 per cent difference between them.

Sir M. Visvesvaraya.—We have no details of that.

Chairman.—It is 668 against 702; there is no real difference.

Sir M. Visvesvaraya.—He takes the figures and makes up a rough estimate. The totals are of his original quantities he picks out here and makes a general statement, but that is not a detailed estimate. What is required is a detailed estimate for guidance in the execution of the work. Such an estimate has not been given. If you can show me such an estimate I should be glad.

Chairman.— It is common ground that he has not. There is no estimate except the one appended to the report, accompanied with the fact that Sir George's estimate worked out at 668 lakhs. It was a very good estimate so far as it went. The project estimate which before us is only 702 lakhs, a difference of 5 per cent.

Sir Frederick Hopkinson.—The only thing I should object to in what you say is the use of the word " estimate."

Chairman.—Anyhow, there was no substantial difference in February 1922 between Sir George and Mr. Lewis as regards the ultimate price?

A.—There was no substantial difference.

Q.—668 in February 1922, and 702 in October 1922, which is a difference of about 5 per cent?

A.—Yes.

Q.—There is nothing in it?

A.—No.

Sir M. Visvesvaraya.—With regard to the dredgers, you have not given any concrete examples of other dredgers of similar design which have been working quite satisfactorily. You have not given any calculations for the "Hotspur," and on what basis you prepared your designs. To show the confidence placed in the present dredgers is not misplaced, you assume that the dredgers will work all right, then you assume the rates will be low, and then you make up the figure.

A.—On what they have actually done.

Q.—What would you expect to do hereafter—5 annas? That is what you expect hereafter as the rate?

A.—They give the actual cost at a rate of about 8 annas a cubic yard. I expect with the dredger working for 24 hours a day instead of 16 hours a day, and put on a system of payments by results, to get a much greater output, and the result would be, of course, that the cost per cubic yard would go down.

Sir M. Visvesvaraya.—You have overlooked what the plant has been able to do hitherto, and you have overlooked the fact that she has to dredge hard material. That comes into it. Then there is the distance. It cannot go into a certain area. All those things have not been taken into consideration, and I am afraid other important factors have not been taken into consideration.

Chairman.—There is no doubt that is so.

Sir Frederick Hopkinson.—Where was this pumping ashore dredging work that you have told us of?

A.—At Pria in the Straits Settlements.

Q.—What did that cost?

A.—I was not on that work myself. I was on a similar contract some miles away, and I visited that work periodically. Although it was being carried out by the same firm at the same time, I was not intimately acquainted with the cost of that dredging.

Q.—What was the similar work you carried out?

A.—That was on another contract, but that other contract did not include reclamation works.

Q.—You have had a lot of experience of dredging?

A.—I have had experience on the different contracts on which I have been.

Q.—Do you mind telling me one or two of them so that I may make a note, suction pump cutter dredging?

A.—No.

Q.—No experience?

A.—I have not worked a suction cutter dredger myself.

Q.—Therefore you cannot tell us what has been the cost of such works from your own experience?

A.—Not from my own experience except the Back Bay work.

Q.—From your own experience?

A —Outside Back Bay?

Q.—Yes.

A.—Not outside of Back Bay.

Q —Your experience of Back Bay was limited to seven weeks at the end of 1922?

A.—My visit there.

Q.—Was that when the dredgers were not working?

A.—Yes.

Q.—So that you do not know anything about the dredgers at Bombay except what you have read?

A.—What I have read and heard about it. I have endeavoured to make that clear from the statement.

Q.—I want to get it quite clearly?

A.—That is perfectly clear; that is quite right.

Q.—You have no personal knowledge of the dredging at Bombay?

A.—Except what I have been told by other people.

Q.—Just so yes or no. It is quite a simple question.

A.—No personal knowledge out in Bombay?

Q.—In Bombay?

A.—No.

Q.—And no other personal knowledge of any suction pump dredging?

A.—No.

Q.—Can you tell me what percentage one ought to expect to get from a pump dredger of solid material?

A.—You are doing well if you can get 15 per cent.

Q.—What material is that in?

A.—In mud.

Q—Anything else?

A.—Clay—good cutting clay.

Q.—You say you are doing well if you are doing that, but what I want to know is what could you reasonably expect to do as an average output?

A.—In those materials?

Q.—Yes, or in any material you like?

A.—I have not got any figures, but I could bring a lot up. You are asking me my opinion.

Q.—I ask you if you can tell me what one has a reasonable right to expect?

A.—12 to 15 per cent.

Q.—Do you know where you have ever got 15 per cent, or where it has ever been got?

A.—In this Back Bay work—I do not want to encroach on Mr. Settle's evidence. Mr. Settle has brought home a lot of his tests made out there.

Q.—We have got those; we will criticise those afterwards.

A.—Yes.

Q.—Can you tell me where 12 to 15 per cent. has ever been obtained?

A.—I think I could find that from my note; I could search.

Q.—You cannot tell from memory?

A.—I am afraid I cannot.

Q.—You have had no experience of it; therefore it will be only something which you have learnt somewhere?

A.—That is right.

Q.—The evidence that has been given before us has been consistently to the effect that if you get 10 per cent. average output you are getting quite a good result. Have you any objection to that, or do you agree with that?

A.—I think it could be improved upon.

Q.—You think it ought to be improved upon?

A.—I think it ought to be improved upon.

Q.—But you have no experience to go upon. I feel rather a difficulty as you have no experience in asking you any questions about it. Is not it the fact that there is curiously little known about the work of suction dredging?

A.—I do not think I could agree with that.

Q.—Can you point out to me anywhere where reliable information on the work of suction dredgers can be obtained? You do not seem to know?

A.—I am certain I could find many references.

Q.—But you do not happen to know them?

A.—Not offhand, but I think there are many of them.

Q.—I suggest to you that there is curiously little known about it?

A.—Really.

Chairman.—We must try to add to the knowledge.

Sir Frederick Hopkinson.—We must, but at the present moment there is hardly any information available; the people who have done the work have kept it to themselves.

A.—I have some records in my office of suction dredgers.

Q.—I would like you to bring them this afternoon?

A.—Yes.

Q.—You say you have got them in your office. Would you mind bringing those this afternoon?

A.—I shall certainly bring them if I can find them in that time. I am rather surprised at the question, because I should have said offhand I could have picked up two or three papers on the subject of suction dredging.

Q.—That is what one would say. I can give you records, but they have not been published.

A.—Quite so. I am talking about published records.

Q.—I mean records that anyone can get at?

A.—That is what I am talking about. I will endeavour to find them, and let you have any papers, or at least the reference to them.

Q.—If I can have them by 3 o'clock, when we meet again, I shall be greatly obliged.

A.—Certainly.

Sir H. Courthope-Munroe.—I think it was suggested that we should put in letters of complaints by Messrs. Buchanan with reference to the output of the "Sir George Lloyd." I have before me a letter written by the gentleman in the Chair, Mr. Halcrow, and the following correspondence. It might be as well that you should have it, and that he should deal with it. (Documents handed in.)

Chairman.—Thank you very much.

(Adjourned for a short time.)

Sir Frederick Hopkinson.—Have you got those figures that you were going to get me of the outputs of the dredgers?

A.—I have not been able to complete the statement. It is being prepared, and as soon as it is ready it will be handed to you.

Chairman.—The two matters are with regard to the "Kalu" and the Development Directorate staff. They are referring to pages 16 and 20 of your statement, are they not.

A.—Those are a further two matters to which I am also attending.

Q.—Will you let us have them in time to-morrow?

A.—I have given instructions for them to be searched for. Here is some correspondence which has been handed in. There is a letter dated 26th February, 1925, to the Chief Engineer through the Director of Development. In this letter we draw attention to the low average hourly output of the dredger in the first paragraph, and, after going through certain facts, we come to the foot of page 2 and say: "As the output of the dredger and auxiliary craft so largely depends upon the dredging staff, you have no doubt arranged to pay bonus on the output, and we shall be obliged if you will let us have a copy of the bonus conditions, also particulars of the method of measurements adopted as the basis of payment and for weekly progress.*

Sir Frederick Hopkinson.—In connection with that we were told that the scale of bonus had been settled by Sir George Buchanan.

A.—Do you know when? In this correspondence, which takes us up to September, 1925, apparently no bonus had been arranged, that is to say, during the second season of dredging. The Chief Engineer's reply to that is dated 20th March, 1925, on page 4: "No bonus on the output has been arranged for this season owing to the fact that only one of the Assistant Dredging Masters has had any previous training, and I consider it would be throwing money away to fix a bonus at a low rate of output at this stage of the operations to enable the men to earn any bonus."

* See Appendix XVIII.

Q.—After that a bonus must have been arranged, because one of the witnesses said that he did earn a small bonus, and although it was small it was acceptable. That was his phrase.

A.—Was not that in the third season?

Q.—I say that it was after that. With regard to the question you raised about the "Kalu," they answered that in this way: "With regard to a weekly progress return for the 'Kalu,' as this vessel is only able to work for an hour or two a day every other week and her output is so very small being only about 225 cubic yards per hour." That was terrible, was it not? 2,000 cubic yards per hour was her guaranteed output and 225 her actual?

A.—That was the "Kalu"?

Q.—Yes.

A.—Her designed output, I think, was less than that of the "Sir George Lloyd."?

Q.—No, 2,000 yards. The difference was that she was dredging down to 40 feet instead of 70 feet, and she was 2,700 H.P. as compared with the 3,000 H.P. of the "Sir George Lloyd." She had the same guaranteed output of 2,000 cubic yards per hour in soft clay, and when she went on to this Back Bay work she did 225 cubic yards per hour.

A.—On the 23rd April, reference is again made in a letter from my firm to the Chief Engineer through the Director of Development. In the last paragraph on page 2 we again express an opinion on it: "As a bonus on the output has not been arranged, we consider it should be arranged even at this late period of the season so as to give the men concerned the assurance that their better effort and skill in working the craft will be rewarded. We are strongly of the opinion that the best output will not be obtained until a bonus is given and we therefore suggest that a start should be made at once with a reasonably substantial bonus to the Dredging Master (Mr. Spiers) and downwards."

Q.—That was 23rd April? That letter would not get there for a fortnight and that would take them up to about the 7th May?

A.—Just about the end of the season. They could not do anything practically in that season but they could prepare for the next one.

Q.—Which apparently they did?

A.—Yes. We have no information other than what is in the evidence taken in Bombay. The next reference to bonus is in a letter of the 23rd July, 1925, in which we state: "Further to the correspondence re output of the 'Sir George Lloyd' last season, we have had long conversations with Mr. Brims and have formed the opinion that the main causes of low output are the lack of incentive to the men in the form of a bonus on output, and also that there would appear to have been too much time spent on obtaining hard material at the expense of output which we consider of greater importance."

Chairman.—Were you able to form any view of Mr. Brims?

A.—His ability, do you mean?

Q.—Yes, his ability, his energy and his driving force.

A.—On one occasion he worked under me when I was with contractors and I formed a high opinion of him. He was a good worker.

Q.—His experience as regards dredging was when he was about 22 years of age, was it not?

A.—Oh, no.

Q.—He said so?

A.—I know for a fact that he was engaged for years on the main dredging contract at Rosyth. The dredging contract started there, I think, in 1913.*

Q.—That would be bucket dredging?

A.—It was all bucket dredger work, but it was all dredging work.

Q.—Sir Frederick Hopkinson put some very pointed questions to him in Bombay at the conclusion of his evidence, and we got a very fair idea of Mr. Brims' previous experience.

A.—That is a case of which I know definitely, because I had something to do with that contract.

Sir Frederick Hopkinson.—At Rosyth?

A.—Yes, and Mr. Brims was engaged on it. Then, in reply to that, the Chief Engineer, in a letter dated 8th August, 1925, with reference to bonus, states: "My idea is that a monthly bonus should be paid on *actual pumping time* only, exclusive of time spent in pumping water only, provided that measurements show that the quantity pumped is not less than say 900 cubic yards per hour."

Sir Frederick Hopkinson.—That is putting it very low, is it not?

Chairman.—45 per cent.

* See Appendix XX.

Sir Frederick Hopkinson.—They ought to earn a very handsome bonus indeed starting from that as a basis?

A.—They should do.

Q.—I should be inclined to put the bonus figure at 2,000?

A.—That is not my idea of bonus on a vessel designed to do an average output of 2,000. I should begin below that so that the men would work up to it. In reply to that we said, in your letter of the 16th September, 1925: "We note your suggestion that bonus should be paid on the *actual pumping time* and have given it our careful consideration. The idea is new to us, and while we realise that a bonus on this basis would make for an increase in the number of hours' pumping (with reservations regarding the quantity of material pumped) we are of opinion that better results would be obtained by adopting the more usual system of bonus on the *actual quantity of material dredged per hour.*"

Q.—Is it not the same thing?

A.—It does not appeal to me as being the same thing.

Q.—But it is? Surely you would not pay the bonus when the dredger was not pumping?

A.—The difficulty, to my mind, is working it out on a basis of the actual quantity pumped.

Q.—Spread over the pumping hours?

A.—In my opinion the better thing is to take the quantity dredged and divide it by the pumping hours, which is the actual quantity of material shifted.

Q.—Is not that what he proposes?

A.—It did not strike me as being the same thing at all.

Chairman.—You say he puts actual pumping time in the letter of the 8th August?

A.—Yes, that is what he writes.

Chairman.—It might be pumping water and not material.

Sir Frederick Hopkinson.—But the bonus is paid not on the time the dredgers are pumping, but on the output of the dredgers. Therefore it is the same thing. You are talking about precisely the same thing. You may call it pumping time or pumping hours, or what you like; the whole thing is that you are paying them on the output?

A.—But what he says here is, "Provided that the quantity pumped is not less than 900 cubic yards per hour."

Q.—Pumping time?

A.—That is the output per hour.

Chairman.—They would have a bonus for every hour of actual pumping time, provided that the measurements showed that during that time they were doing 900 cubic yards per hour. You said, "No, no, put it this way: never mind the time, look at the result"?

A.—Yes.

Q.—"Pay them a bonus on the amount they dredge"?

A.—Yes.

Sir Frederick Hopkinson.—But it must be regulated by the time.

Chairman.—In a sense, yes.

Witness.—The point was this, if I may say so. If they pumped for 15 hours per day, for example, and just cleared the 900 yards per hour, they would be paid the bonus. On my system, if they did 1,500 or 2,000 or 2,500 an hour so the bonus would increase. That is the difference.

Sir Frederick Hopkinson.—The bonus is to begin, according to this, after they have pumped 900 cubic yards an hour?

A.—He says, "Provided that the quantity pumped is not less than." He makes that reservation.

Q.—There is no bonus unless they pump as much as 900 cubic yards an hour?

A.—Yes, and as long as they go on pumping at 900 or more than 900 cubic yards an hour, for every hour's pumping they do, with that quantity of material being passed, so they gain a bonus.

Q.—I cannot tell unless I see the details of the scheme, but I take it that what he is suggesting is that the minimum rate before any bonus should be applied is 900 yards an hour. If they pump 1,000 yards an hour they will get a bonus on the 100 yards?

A.—I do not read it in that way.

Q.—I cannot read it in any other way?

A.—"Bonus to be paid on the actual pumping time in excess of 80 hours per week." That is the difference between the two systems.

Sir Frederick Hopkinson.—I cannot see any difference.

Chairman.—Your point is that the bonus begins to run from the moment that they touch 900 cubic yards an hour?

A.—Yes.

Q.—And it was calculated upon time?

A.—Yes.

Q.—Their suggestion was time?

A.—Yes.

Q.—Your suggestion was output?

A.—Yes.

Sir Frederick Hopkinson.—I should think there is no real difference between them. Can you tell me whether, in your experience, you have every known of work done at five annas a cube yard, including the cost of the machinery, where there have been double dredgers employed?

A.—On suction dredgers? No, I cannot give you any figures for suction dredgers.

Q.—In the middle of page 3 you say, " The complete lay-out of the reclaimed area had not originally been contemplated." Surely that cannot be true. The original lay-out, was contemplated and included in all the original estimates?

A.—I was not aware of it.

Q.—But you see it in Sir George Buchanan's estimate of 1919. He has got 75 lakhs in for it?

A.—This lay-out to which I refer is the lay-out by the town planner.

Q.—You mean the details?

A.—The complete lay-out of the reclaimed area with roads and recreation grounds.

Q.—You mean the final plans had not been prepared; but you say that it had not originally been contemplated. Surely it was contemplated and included in the estimate?

A.—I do not understand that it was.

Q.—What was the 75 lakhs for.

A.—I have not read in this report that that referred to the making of a new town.

Q.—There is no making of a town. It is lay-out. Here are the roads and drains. That is what has been called the development. What is the 75 lakhs for?

A.—I understand that the 75 lakhs was to cover the following. I am now looking back to the time before I had anything to do with it; you quite understand; but you are asking me a question on that. I think I have made it clear in my statement that this information came to me from questions which I asked when I first became connected with the work.

Q.—You see, it is all given in Sir George Buchanan's report of 1919. He has included a sum of 75 lakhs for it?

A.—At the time I came in connection with the work I asked what this was for, and he told me that this was for such drains as had to be made in connection with the reclaiming of the land and a proposed few roads, which was all to be determined later.

Q.—You have only to read it. It says " Roads, drains, lighting ".

A.—Roads, drains and lighting; that is right.

Q.—That is the lay-out?

A.—Not the lay-out on the lines which were ultimately decided on.

Q.—Never mind the lines; the original lay-out?

A.—But it makes a very big difference.

Q.—What does?

A.—To practically double the area at the lower end of Bombay.

Q.—That does not touch the point. You say it had not been contemplated. I point out to you that it has been contemplated and provided for to the extent of 75 lakhs—roads, drains and lighting?

A.—I refer to the complete lay-out. I say that the complete lay-out of the reclaimed area had not originally been contemplated. Those are the words which I use, and I think they are correct.

Q.—What I think you mean to say now is that the details, the actual site of the roads, had not been laid out until Mr. Davidge came on the scene?

A.—The extent as well as the details.

Q.—The extent was the whole area?

A.—In reclaiming an area, in the way I visualise this reclamation scheme, they would make the land, but it would not at all follow that the Government would decide to complete the full system of roads and surface drains throughout the whole area.

Q.—What do you think they would make it for?

A.—They would do that as and when required.

Q.—You know how contractors work. With regard to your statement at the bottom of page 2, I would like you to tell me if you ever knew a contractor to have conferences with his sub-agents?

A.—Yes.

Q.—You have known of that?

A.—Yes.

Q.—At the middle of page 5 you say, " I mentioned also the necessity for using the run of the quarry to the rubble wall. They would thus have all sizes of stone ". Surely you realise that it is impossible to do anything else. Unless you have enormous storage ground up at the quarry you are bound to clear the quarry. If you are quarrying 2,000 tons a day, if you do not take it away where are you going to put it?

A.—You have to put it on one side if you cannot use it.

Q.—How many months' supply would you put on one side?

A.—In one very large quarry where the output ran up to 60,000 tons a month, none of that small stuff was allowed to go into the work at all.

Q.—It was kept for something else?

A.—No.

Q.—What then?

A.—It was simply put on one side. I quite agree with you it occupied a lot of space.

Q.—Obviously?

A.—And ultimately it was got rid of by selling to other people outside.

Q.—But here you wanted the whole quantity?

A.—But they were putting a lot of this small stuff on one side.

Q.—But they could not put it on one side I have seen the quarry, and it is physically impossible to put a lot on one side?

A.—They were putting it on one side at that time.

Sir Frederick Hopkinson.—They could not; there is no room for it. As the quarry exists to-day there is no room to put a large quantity aside.

Chairman.—Have you been to Khandivli quarry?

A.—Yes. This note was made at that time. The reason for bringing up that point at the time was that they were not sending all that down to the wall.

Sir Frederick Hopkinson.—Then they could not have been quarrying 2,000 tons a day and putting much of it aside. It is absolutely physically impossible?

A.—They were not quarrying anything like 2,000 tons a day.

Q.—That is the rate at which they are supposed to work and have the plant for. At the top of page 7 you say, " The increase of prices between 1912 and 1919 was from 10 to 20 per cent., and between the end of 1919 and 1921 from 50 to 100 per cent." What is that for—labour or material; plant and machinery from England?

A.—It does not include anything from England at all. It is local labour and plant. I do not know whether it was made quite clear this morning, but in my statement I distinctly say that this was an experience which I had in the tropics.

Q.—It does not apply to India; I had forgotten.

A.—But it is very near India, and I thought it was a suitable comparison to make.

Q.—As a matter of fact we were told that the cost of labour had doubled itself in India; that is the evidence. At the top of the page you say: " It is well known to all engineers or contractors who carried out public works during the years following the termination of the war that there was an enormous increase in all prices during 1920 and 1921 ". I suggest to you that that is entirely wrong. The large increase in prices was long before 1921?

A.—Between 1919 and 1921 my experience was that there was a very large increase in prices.

Q.—Over 1912?

O.—No, between 1919 and 1921.

Q.—Is that for machinery from England?

A.—Yes, that is for machinery from England.

Q.—Let me tell you that the absolute highest price for pig iron in September, 1920, was about £11 10s. a ton, and by the end of 1921 it had fallen to below £5 a ton?

A.—At the end of 1921?

Sir Frederick Hopkinson.—Yes.

Chairman.—What do you say to that?

A.—That is coming to the end of 1921. There is a difference between the end and the beginning of 1921.

Sir Frederick Hopkinson.—Take it in March, if you like. The price was then £6 a ton as against £11 10s. a ton in 1920.

Chairman.—What do you say to that?

A.—These figures are taken from my own experience during that time of plant which was arranged for in 1919 and had to be built and supplied up to the beginning of 1921.

Sir Frederick Hopkinson.—Crown bar iron, for instance, in September, 1920, was £30 a ton. By May, 1921, it had fallen to £16 a ton?

A.—It came down in 1921.

Q.—But you say it increased in 1921?

A.—No, to 1921.

Q.—In the early of part of 1920 it rose; the height was reached in September, 1920, and then it rapidly fell?

A.—It came down in 1921, yes. That should be 1922 as a matter of fact. I should have included in there 1919, 1920 to 1921 if I might alter it.

Chairman.—You must apply your mind to the date, Mr. Halcrow. The date on which Sir George Buchanan furnished his estimate of 668 lakhs was February, 1922, by which date there had been a great fall?

A.—I follow that, but by that time—(I am now going into Sir George's province; I would rather not, but I will make just one remark in reply to that)—very large expenditure had been incurred in connection with Bombay. That is the view I take. It had been incurred during the peak of the prices in 1920, which was the peak. That is admitted by all, I think.

Q.—That is quite right.

A.—And his estimate was based on actual cost of the plant during that period.

Sir M. Visvesvaraya.—Which estimate do you mean?

Chairman.—The 668 lakh estimate. He says that Sir George based his prices on the fact that expenditure had been incurred at the peak.

Witness.—Yes, quite right.

Sir Frederick Hopkinson.—But the statement that prices were rising up to 1922 is wrong, because we know that prices dropped away suddenly in 1921?

A.—They dropped away suddenly in 1921 and again in 1922, but that also coincides with my experience. 1920, I consider the critical year, but it began in 1919.

Q.—It began to rise in January, 1919. It went up from £14 to £30 a ton from January, 1919, to about the middle of 1920. Then it fell away equally rapidly until, at the end of 1922, it had gone down to about £10 or £11 a ton?

A.—In the manufacturing of machinery there is a time lag on the basis price.

Q.—We know that prices were falling, because they got a rebate from Messrs. Simons on account of prices having fallen during the time they were actually building the dredgers?

A.—In 1921?

Q.—Yes. At the middle of page 8 you say: "It has been revealed by the evidence taken by the Committee in Bombay that the revised dredging estimates were based on improper data, and are therefore of no value." The revised dredging estimates were based on what the work was actually costing, were they not?

A.—As I understand it, the revised dredging estimates were based on the amount of filling retained in either the first or second season, or both, and therefore I consider that that is improper data on which to base it. For dredging cost it should be based on the work the dredger does, and also one would expect the dredgers to be worked for the full time.

Chairman.—And you would expect that the sea wall and cross-bunds would retain the material pumped?

A.—Yes.

Sir Frederick Hopkinson.—You say it is an improper price, and I am inclined to agree with you. It is only five annas. The dredging price in the project estimate is five annas a cube yard?

A.—That is the project estimate for the dredging, five annas.

Q.—Yes. You say it is based on improper data?

A.—Oh, no.

Q.—That is what you say—" and are therefore of no value."

A.—That is not what I intended to say.

Q.—That is what you do say?

A.—I am referring here to the revised estimate.

Chairman.—That is the document?

A.—No, the revised estimate—not *this* revised estimate.

Q.—You mean the revised estimate of 1,100 lakhs?

A.—Yes.

Sir Frederick Hopkinson.—What is the price there for the dredging? What is the actual price per cube yard in that estimate of 1,100 lakhs?

A.—I do not know what the actual price is in that estimate.

Q.—You say it is of no value?

A.—I am talking about the totals here. In the revised estimate, as I understand the position, if I may put it briefly, they based it on the amount of filling that they had obtained in the first season, and they said: "The dredger has only done so much; therefore it will take 20 or 30 years to complete." I forget the exact figure.

Sir Frederick Hopkinson.—35 years.

Chairman.—Those were Sir George Buchanan's figures?

A.—Well, a very long period. Having started on that assumption of 30 years, or whatever the figure is, to complete, they built up an estimate on that. In my opinion that is not a proper way to make an estimate.

Sir Frederick Hopkinson.—I suppose they were afraid of making estimates. They wanted to go on something they knew, for a change.

Chairman.—They were working entirely on past experience, were they not?

A.—On their past experience.

Q.—They said "If the future is no better than the past, it is going to cost 1,100 lakhs." That is how they did it?

A.—My view is that they should have taken it on the quantity dredged and not on the quantity retained. That is one point.

Sir Frederick Hopkinson.—But did they take it on the quantity retained?

A.—I cannot say.

Sir Frederick Hopkinson.—We have no figures to tell us that. What I should like to know is what price was put in that estimate of 1,100 lakhs—what price per cube yard. Then we can thrash it out.

Sir M. Visvesvaraya.—It comes to 1·1 or 1·2. 360 lakhs is the cost of working the dredger.

Sir Frederick Hopkinson.—I would like to see that figure. I have 250 lakhs here. We can easily work it out.

Sir M. Visvesvaraya.—310 lakhs is the cost of the dredged filling.

Sir Frederick Hopkinson.—I have here the figure of 250·78 lakhs. That looks like about 1s. 6d. per yard.

Sir M. Visvesvaraya.—"Dredged filling, 310-22 lakhs" appears in the 1,000 lakh estimate.

Sir Frederick Hopkinson.—That is ridiculous. They are doing it for a little over half a rupee. (*To the witness.*) You realise that this eight annas spoken of on Page 8 is the cost of working only. It was eight annas three pice I think. That is only the cost of working. That does not include the machinery at all?

A.—No.

Sir M. Visvesvaraya.—This 1·10 rupees also does not include machinery.

Sir Frederick Hopkinson.—It is ridiculous; it is not worth consideration. (*To the witness.*) At the bottom of page 9 you say," "Having perused the weekly statement of progress." Did that include the quantities of dredging done?

A.—Yes.

Q.—We have been told over and over again that those quantities were never known. Did they send you the weekly quantities of dredging done?

A.—Yes.

Sir Frederick Hopkinson.—Can you make anything of that, Mr. Chairman?

Chairman.—Only the fact that this witness says he got it. It did not stimulate Sir George Buchanan, or anybody else, to protest.

Witness.—It was on the basis of those weekly reports that, when it fell to me to take action in the matter, I wrote the letters which have been handed in this afternoon. It was in the middle of the second season.

Sir Frederick Hopkinson.—We have been told over and over again that the quantities of dredging done were never known until the following July or August.

A.—That is true as regards the amount of filling.

Chairman.—Reclaimed material.

Sir Frederick Hopkinson.—No, dredged. I put the question several times, why they had not known every day what the dredger was putting out, and we were told there were no quantities available by anybody?

A.—Yes, the quantities were certainly available from the dredger.

Q.—That is the only important thing. The amount of land reclaimed has nothing whatever to do with the dredger.

A.—If I may refer for a moment to the letters which have been handed in to-day, we cite in *this* letter those weekly reports. We refer to the week ending 18 December, 1924, the 1st January, 1925, the 29th January, 1925, and the 6th February, 1925—the average hourly output per week. We have here 1222, 1133, 799 and 613. These have been taken out for the purposes of the letter. But there was no information as regards the amount measured as reclaimed land until the following summer; that is quite correct.

Chairman.—Sir Frederick is on soundings.

Sir Frederick Hopkinson.—I am on soundings—the only proper way to measure up the work done.

A.—They were taken.

Sir Frederick Hopkinson.—We have been told that the soundings were taken daily, handed into the office, and nothing done with them.

Chairman.—And sent to London week by week?

A.—Week by week.

Sir Frederick Hopkinson.—That they actually took out the quantities there and sent them to London?

A.—That was the basis of taking this matter up here.

Q.—How can you test a dredger's working unless you take soundings? It is the only proper way to do it, is it not?

A.—That, in addition to taking the tests in the pipes.

Q.—That is for casual reference, if you want to know at 10 o'clock in the morning what percentage you are getting; but at the end of the week you would not be satisfied with that, would you?

A.—No; you want block measurements. Measurements in the pipe, in my opinion, should be taken frequently as a guide.

Q.—They are a comparative guide, but you would not accept them as final? You would not pay on them? You do not accept them as final? You would not pay on them as Resident Engineer, would you?

A.—Certainly not. We would pay on the actual sectional measurement.

Q.—Did you realise that when you were complaining about their taking the hard clay to the moorum that they had to get all that it was possible for them to get owing to the restrictions put on by the Indian Marine and the Port Authorities, and that there was no spare material available?

A.—That is not as I have understood the position.

Q.—There are 36 millions. If you deduct from that 15 million that leaves only 21 million yards available. Is not that so?

A.—21 million from the harbour. When I became connected with the work (this is outside my province altogether) they had decided to obtain material from Back Bay.

Q.—They were talking of it?

A.—They had made up their minds, I think, then. I am speaking from memory. The Resident Engineer, when he had completed his borings, wrote that there were over 25 millions yards of material available in Back Bay. I think I am right?

Q.—Yes. You are quite right. Twenty-five million was the quantity given.

A.—Therefore, between the two sections there did not seem to me to be any necessity for scraping up that last cubic yard of rock from the bottom.

Q.—It is all a question of time. On page 13 you give some general remarks about how machinery should be bought, and you say: "The plant is tested against the specification before being taken over from the builder." That is all a question of arrangement, is it not, and what you put in the contract? If you put in the contract that it is to be tested in Bombay on the actual work it has to do, that is the proper place to do it, as was done in the case of the "Kalu" and "Jinga"?

A.—That is all a matter of arrangement, as I understand it, but, as I mentioned here, I have not come across a case of that kind in my experience.

Sir Frederick Hopkinson.—You are the first man I have come across in connection with this enquiry who has entirely agreed with the view I put forward, that you cannot move clay without increasing its bulk. I put that as a proposition to them in Bombay, and it seemed to surprise them all. I notice you agree with me?

Chairman.—It is a fact, is it not?

A.—It is a fact, that is to say, briefly, that the quantity of filling required in the reclaimed area will be less—No, let me put it the other way.

Q.—That you cannot move solid material without increasing its bulk?

A.—Yes.

Chairman.—Material which has been under compression for centuries, when dredged out, increases in bulk.

A.—Which means that the quantity of material to be dredged is less than the quantity of filling required.

Chairman.—If you are dealing with clay, and clay alone?

Sir Frederick Hopkinson.—In the last paragraph, on page 15, you say: "In order to help the Department we looked into the question of the best way to put the "Kalu" to work in Back Bay. I suggested that the "Kalu" should cut a flotation channel, pumping the material through a short pipe-line, say, 100 yards, to one side." Is this the plan that you sent out giving those views? (indicating same to the witness).

A.—I do not know that a plan was ever sent out. My connection with it was when I discussed it with Mr. Brims.

Q.—What is the stamp on it?

A.—That is the office stamp, 2nd May, 1923. That would be about the time.

Q.—Was that your idea at the time?

A.—This was my idea, subject to the information which at that time was being asked for regarding the cables coming across *here*, which would necessitate moving the channel to this point *here*, when the position of the Eastern Telegraph Company's cables had been determined. My idea was that rather than go in and dig a hole, a channel should be dug in so that the vessel should be free to come out, and, always being afloat, that she would dredge all the time.

Q.—*This* is the plan which illustrates the instruction or the idea?

A.—The idea.

Q.—This channel is 3,200 feet long and 300 feet wide?

A.—My intention was not take it as wide as that. That is diagramatic only.

Q.—What width did you intend to take it?

A.—Perhaps 50 yards.

Q.—What about the depth? *This* would be for the "Kalu" to float in at low water?

A.—Yes.

Q.—Do you know anything about the soundings on *this*?

A.—*That* is the 2-fathom line, and *that* is the 1-fathom line.

Sir Frederick Hopkinson.—So that the depth of water *here* would be about 3 feet, I suppose—about half a fathom? You would want to float the "Kalu" in about 3 fathoms. Twelve feet would not float the "Kalu." Did not she draw about 14 feet?

Chairman.—No, her mean draught was 8 feet.

Witness.—I cannot say from memory, but my recollection is that the two fathoms suggested here left comfortable margin.

Chairman.—"Mean draught, with 150 tons coal in bunkers and 820 tons water in tanks, about 8 feet."

Sir Frederick Hopkinson.—In the middle of page 17 you say: "The Government of Bombay placed the execution of the works in the hands of the Development Directorate, who took the same position as contractors and rightly assumed full control." Why do you say that? All the time we were in Bombay the Development Directorate absolutely refused to take that position, and said that they never had taken that position.

A.—I have never understood any other position but that they were carrying out the work. They were the executive. That has always been perfectly clear in my mind since I became connected with the work.

Sir Frederick Hopkinson.—Why did not you settle the matter with Sir Lawless Hepper. You were out there? He said most positively that he never occupied that position; he never interfered in the carrying out of the work, except on one occasion, and that was the occasion of sealing the sea wall. That is the only occasion on which he said he ever interfered with the carrying out of the work. Is not that so, Mr. Chairman?

Chairman.—Yes.

Witness.—I have always always looked upon Sir Lawless Hepper as the manager in charge of the work. I might just mention one or two points which have been brought

to my notice. I think they were before my time. They sent home a requisition for additional plant, and the firm had to express the opinion that they thought the plant (wagons, cranes, or whatever it was) was rather excessive for the quantities with which they were working, and they wrote back to that effect. They received instructions from the Director of Development to order the plant.

Sir Frederick Hopkinson.—My recollection of that is that Sir George Buchanan wrote saying that he did not like to interfere with the liberty of the man on the spot. Is not that so?

Chairman.—But that at the same time, all expenditure did increase the capital cost of the work. The letter of request for the plant was the 17th March, and Sir George Buchanan wrote a very excellent reply suggesting to them that some considerable portion of this plant was not necessary, and he asked Mr. Lewis to communicate with the Development Director and cable his opinion. The Director of Development cabled his opinion that the plant was necessary with the exception of one crane; and that plant was ordered, but it was ordered unquestionably in the belief of Sir George Buchanan that the whole of it was not necessary and was an extravagance.

Witness.—That is one instance which proved to me that the Directorate assumed full control as regards the execution of the work.

Sir Frederick Hopkinson.—Were there any other instances?

A.—I have no doubt I could find one or two more.

Chairman.—We asked Sir George whether he would tell us of any other instances in which he put the brake on. He was putting the brake on there, and saying " Look here, you are ordering plant which I think is excessive, and although a great deal must be left to the man on the spot, nevertheless this is going to cost a great deal of money." That was an instance of his putting the brake on. We have asked him to give us any other instances, and no doubt he will, if they occurred. At the moment I do not know of any other except that. It was greatly to Sir George Buchanan's credit to do that. It was quite proper and quite right.

Sir Frederick Hopkinson.—But is it not most extraordinary that, in a matter of this major importance, nobody seems to have thought to have had the matter settled as to who was really controlling this work? You thought Sir Lawless Hepper was doing it. Sir Lawless Hepper says positively that he never intended to do it and that he never did do it.

A.—As far as I am concerned in giving evidence here, I never knew, until I read some of the evidence taken in Bombay, that Sir Lawless Hepper did not consider himself in complete charge of the work.

Chairman.—Sir Lawless Hepper preserved an air of the greatest detachment. He disclaimed all association with the slightest technical knowledge: he was merely the administrative head.

Sir Frederick Hopkinson.—He said himself that he was not competent to do it.

A.—Then why was the work put in his hands?

Q.—He says it was not?

A.—But surely he was the Director of Development, and they were carrying out the work? He had full control of all the accounts, and everything?

Q.—Accounts?

A.—When I say accounts, I mean the purchase of materials and plant, and everything else. His word was law. If Sir Lawless Hepper had said to his staff, " These dredgers must work 24 hours a day," they would have worked 24 hours a day.

Q.—I am not so sure about that, but I think Sir Lawless Hepper was afraid of encroaching upon the privilege of Sir George Buchanan.

A.—It was very unfortunate that he did not say so a long time before.

Chairman.—I think the real position was that Sir Lawless Hepper left it to Sir George Buchanan, and Sir George Buchanan left it to Sir Lawless Hepper, and therefore, relatively, nothing was done.

Sir M. Visvesvaraya.—But what becomes of your responsibility according to the terms of the contract? It is said in the first clause " They shall perform all work and duties devolving upon engineers of large works." " All work and duties." You did not disclaim that responsibility for all that time, and now, when trouble comes, you say, " We had nothing at all to do with it " etc.?

A.—No; I would not like to think that.

Chairman.—First of all you would say that this agreement was entered into nearly a couple of years before you joined the firm?

A.—Yes. I have nothing whatever to do with that agreement. It was entered into long before my time.

Q.—It is " all work and duties devolving upon engineers of large works "?

A.—I would like to say something about that, because I am the engineer for various works, and large works, at the present time. I am now talking about my position as engineer—not consulting engineer, which is another position I occupy with regard to certain other clients.

Q.—Nor contractor?

A.—And I am not a contractor. I am glad to say I have been a contractor for a number of years, and I value that experience very highly indeed, but I am not now; I am back again where I started on the consulting engineer staff. As consulting engineer I have tried to explain briefly in my statement what my duties are. Work is actually being carried out at the present time in Europe, in connection with which I act as the consulting engineer. I do not go near those works unless I am invited to do so by the Board of Directors. They have their own staff out there; they have their own machinery, and they carry out the work. They ask my advice when they want it. In other cases I am the engineer responsible for carrying out the works. In those cases I have prepared the plans, or the designs, the specifications and the schedules of quantities. Those works have been let by contract and are being carried out by contractors. I have my own staff of resident engineers and assistants on the work who look after things for me locally, and I visit the works periodically. I have no executive control over those works. The contractors are responsible for the speed of the work, and they are under penalty if they take longer than the contract time.

Q.—The contractor has bound himself to produce a given result for a given price within a given time?

A.—Yes. If he does not make the requisite progress and I am not satisfied, what can I do? I have three courses open to me. First, I complain. If it is not put right and still goes wrong it is then open to me to refuse interim payments on certificates. If that does not bring the requisite progress, and things are still going badly, under my conditions of contract I can determine the contract and take it out of his hands altogether. That is a very serious matter. That is the position of the engineer responsible for the work, but he has no control over the payment of the men or anything else. All those are matters for the contractor to deal with.

Sir M. Visvesaraya.—That again, is due to Sir George Buchanan's position, because Sir George Buchanan has no staff out there.

A.—May I just go on to the analogy in Back Bay?

Chairman.—Please do.

A.—In Back Bay the work is being carried out without a signed contract, as it were, between the Government and itself, because the client, the Government, is carrying out its own work. Therefore the engineer unfortunately does not have the same control. In this case it was apparently arranged that the chief engineer responsible under the Director of Development for the execution of the Back Bay works should act as resident engineer, and the firm should have his nomination. I did not like the arrangement, but there it was. Let us take it as it stood. His duties as resident engineer would be to report to Sir George Buchanan or to the firm, as the case may be, on all matters concerning permanent work. If there were any work still remaining to be designed, which is quite an ordinary feature of large works, he would send him the local data on which the firm could build up their designs and further specifications. But in all matters relating to execution he was responsible to the Director of Development. I have indicated in my statement that I once occupied a somewhat similar position. That was 16 or 17 years ago—and a small work; I was sent abroad by Mr. Meik as resident engineer on the reconstruction of a pier in Europe. It was intended that the work should be carried out by contract. It was in the early days of reinforced concrete, and the design included the handling of what were then very large piles running to about 60 feet in length. Tenders were invited from contractors locally, but they were unsatisfactory. They were rather afraid of the work—it was beyond them—and I received instructions to carry out the work myself for Mr. Meik's clients, and I did so. In all matters relating to the designs or to Mr. Meik's specification, to the tests of materials and workmanship, if there were any little alteration which local conditions required, I referred those matters and reported progress, to Mr. Meik, any questions as to what labour was to be paid, where I was to obtain my materials and buy them, and so on, I dealt with his clients out there. That is a somewhat similar position, although I say it was a small job and not of the magnitude of Back Bay. That is as I understand the position.

Sir Frederick Hopkinson.—But circumstances are not quite the same in that case and in Bombay. Take the dredging, for instance, which is the major part of the scheme in Bombay. There is no designing there, having once bought your dredger?

A.—The actual designing required for the Back Bay work is very small.

Q.—Is there any in the dredging work in Bombay?

A.—No actual designing.

Q.—Is there any engineering in it beyond buying the dredger—there are no plans to make?

A.—There are no plans to make

Q.—There is nothing to supervise. All you have to do is to get your output?

A.—All you have to do is to get your output.

Q.—There is no engineering about it at all.

A.—It is in the wall that there is engineering.

Q.—Leave the wall out. I am speaking of the dredging. There is nothing for an engineer to do in connection with that?

A.—No. Actual practical engineering matters crop up in connection with these engineering schemes. In one which I was connected with it transpired that quite a lot had to be done in connection with engineering. The material was so fine in suspension that a great deal of it was carried away in the overflow. Instead of the surface water running clean away from the reclaimed area it was carrying quite a lot of pumped material in suspension, the material was fine silt and mud. It eventually required the dividing up of the reclaimed area into a very large number of small compartments for pumping and repumping, and changing from one to the other.

Q.—That had been done here. It was separated into compartments by cross-bunds. There is no engineering, is there. Why should an engineer be paid 2 per cent. on the cost of dredging here, because he had absolutely nothing to do for it?

A.—If one starts to subdivide up what an engineer should be paid for on a scheme, and what he should not be paid for, it would be rather a difficult matter, I think.

Q.—I am suggesting that as there is no engineering, that 2 per cent. covers the control of the work. But that is a matter of the construction of the document.

A.—I would disagree with that.

Sir M. Visvesvaraya.—There is one point you have not answered. You had no representative on the spot. You yourself are 5,000 miles away from the works. Why did you not make arrengements to see that your share of responsibility according to the contract was properly fulfilled? You have not done so.

A.—We are going back now and I do not want to step out of my province; but briefly, I say that the resident engineer was the firm's representative. Later on, I think early in 1923, that question was discussed by Sir George Buchanan with the Government of having a separate representative, and it was not agreed to.

Q.—If it was not agreed to, then you ought to have given notice according to the contract, and said: " Something has got to be done. Some proper arrangements will have to be organised ".

A.—I must leave that to Sir George, because it is really outside my province.

Q.—You are arguing by analogy.

A.—I was trying to explain to those members of the Committee who are not in the same profession, who are not dealing with work as we are in Westminister, what the relative position of engineer, consulting engineer and contractor is.

Q.—I want to apply your principles to this case, but you do not want to go into that, I understand?

A.—I have tried to do it.

Sir Frederick Hopkinson.—On page 20 you say: " The dredger ' Sir George Lloyd,' if properly handled, can give her designed output in the material in the harbour." You make that as a statement.

A.—I take it from the evidence given in Bombay.

Q.—" The Development Department staff have admitted this to the Committee."

A.—I am looking for that reference which was mentioned this morning to send it on to you. I am going to let you have that reference.

Q.—I thought you were making that first statement on your own authority?

A.—No.

Q.—On page 21 you take as the basis of your cost 5 annas per cubic yard. You are unable to point out to me any work that has ever been done at anything like that price?

A.—You are talking about suction dredgers, are you not?

Q.—Yes.

A.—Not about bucket dredgers?

Q.—Suction dredgers?

A.—I have taken those figures from the evidence.

Q.—But we have no evidence that it can be done at that price—none at all, but quite the contrary.

A.—You can take that paragraph as I put it there " on the basis of 5 annas per cubic yard." That is taking the assumption, to begin with, that it would require 6·06.

Q.—It is only an assumption.

A.—We go on from that in the same paragraph to refer back again to some figures on a previous page, where we take 8 annas, which they gave in evidence, as the cost of operating the dredging plant.

Q.—If you take a different assumption, it might cost as much, or only one-fifth as much, and, therefore, it does not help you at all?

A.—No; these figures are taken from the evidence.

Q.—We have no evidence of a price of four annas for pumping.

A.—8 annas.

Q.—This says: "On the basis of 5 annas."

A.—I think the paragraph is clear as it stands, taken as a whole, is not it?

Q.—If you say it is an assumption, it is clear.

A.—Yes.

Q.—But an assumption does not help us. A little further down the page you say: "When investigating the scheme, I found there was no intention of covering the whole area with moorum 1 foot deep." Where did you get that from?

A.—I got that in my conversation with Sir George Buchanan.

Q.—But there has been an intention right away from 1919 to cover it, first of all 1 foot deep and subsequently 2 feet deep. The quantities have been given as 1,810,000 yards and 3,620,000 yards.

A.—Quite so. That is the basis on which quantities have been taken out. I asked the question: "Is it intended to put a carpet of moorum so to speak."

Q.—When you were out there?

A.—Yes.

Q.—There was nothing to put it on there then?

A.—I wanted to know what the intention was with regard to the moorum: was it intended to put a carpet over the whole area; and I was told "No."

Q.—By whom?

A.—By Sir George.

Q.—Out there?

A.—Yes.

Q.—But he has provided for it?

A.—That was taken as the quantity of moorum which would be required to make up the roads and other areas, because where the clay was taken from the Harbour it would be good ground on which you could walk straight away. Where the mud was it would have to dry out on the surface, and then receive moorum on the top. That is what I meant by that.

Q.—But this quantity has been taken over the whole area?

A.—As an average.

Q.—The only alteration made to it has been to double it—to increase it to 2 feet?

A.—When was that increase to 2 feet made?

Q.—I cannot put my finger on it, but I have the figures here. One of the estimates was 3,620,000 cubic yards.

A.—I do not know that figure.

Mr. Billimoria.—You have in your note in several paragraphs expressed your personal opinions?

A.—Yes.

Q.—If you do not mind, might we have briefly what your qualifications are as an engineer?

A.—I have had between 25 and 30 years' experience as an engineer.

Q.—Have you qualifications by examination or practical experience, or membership of any institution?

A.—Yes: I am a Member of the Institution of Civil Engineers, a Member of Water Engineers, a Fellow of the Royal Meteorological Society, and I have a great deal of practical experience all over the world, both at home and abroad.

Q.—You will agree with me that membership of the Institute of Civil Engineers is considered a great honour and privilege by members of your profession? Is not that so?

A.—I am quite pleased to be a Member of the Institution of Civil Engineers.

Q.—How long have you been in this profession of Civil Engineer?

A.—About 27 or 28 years.

Q.—It is recognised all over the world as a special qualification to be a member of the Institution of Civil Engineers?

A.—All Civil Engineers are not Members of the Institution of Civil Engineers.

Q.—But those that are would put it forward as one of the qualifications to secure work, or to secure a job? It is considered a qualification?

A.—It is in some cases, not in all.

Q.—Had you had any personal experience of the local conditions in Bombay before you went out to Bombay in connection with this reclamation work?

A.—Not in India.

Q.—Have you any intimate or personal knowledge of the Back Bay reclamation, beyond your visit to Bombay which you have referred to?

A —That was my only visit to Bombay.

Q.—If you will kindly turn to page 2 of your note, you say in the first paragraph: "Also, in the case of staff or other employees which the Department required from this country, the firm assisted the High Commissioner in the selection of suitable men." You were, therefore, satisfied as to the men who were employed by the High Commissioner being perfectly suitable for the job they were employed on?

A.—Yes.

Q.—May I trouble you to turn back to page 1, where you say: "When orders were placed by the India Stores Department the firm carried out the necessary inspections and tests and reported progress to the Development Department"?

A.—Yes.

Q.—You were the engineers responsible, and had to advise the Government and the Stores Department with regard to the suitability of the plant, and you inspected and tested the plant?

A.—When the Development Directorate sent home requisitions for a crane, they specified they wanted perhaps a 5-ton crane, or whatever it was; and we then had to invite tenders and specify generally what was required. The tenders were inspected and one recommended and forwarded to the India Stores Department; and then after that we had to see that the crane was properly built and inspected, and advise the Development Directorate.

Q.—The High Commissioner, therefore, evidently relied on your advice on such matters?

A.—As regards the purchase of plant.

Q.—You must have very carefully studied Sir George Buchanan's report, being intimately connected with his firm as one of the members thereof.

A.—I have read the report.

Q.—I suppose before you came here to give evidence you again had an opportunity of going over it very carefully?

A.—I have not gone over the report very carefully before coming here. I think I have explained my position with regard to the work as briefly as possible in my statement.

Q.—Even being connected with the firm on a project of such magnitude, you must naturally have taken some interest in it?

A.—Undoubtedly, I have taken an interest in it.

Q.—You have used this document, the report which has given birth to this scheme?

A.—I have read this report.

Q.—Before I go on to the details of the report, will you agree with me that the prices of commodities all the world over before the war were normal—what we call normal prices—and during the war and thereafter the prices had advanced substantially all round?

A.—Prices advanced in a greater or less degree in different countries. That is my experience.

Q.—I want to take India and England; let us confine ourselves to these two countries.

A.—I cannot give you details for India.

Q.—You have no personal experience of Indian conditions at all?

A.—No.

Q.—Taking the prices in this country of both labour and materials, it is well known that during the war and thereafter they advanced until they reached the peak in 1920?

A. -Yes.

Q.—If that was the position, taking a figure in 1913 for an article that would cost, say, £100, what would be the approximate cost in the year 1919 or 1920?

A.—In England, you mean?

Q.—Yes.

A.—In the year 1919, as I think I have already said, perhaps two to two-and-a-half times.

Q. Therefore supposing an engineer had submitted an estimate in the year 1913 at a certain figure, you would, if you were called upon to submit an estimate in 1919, make your estimate two-and-a-half times the original figure?

A.—No, not necessarily.

Q.—How would you qualify your answer?

A.—If the estimate had been made by myself, I might be prepared to say yes.

Q.—That is what I want.

A.—Not if the estimate were prepared by another person.

Q.—I am not asking for any other person; I am asking you as an engineer of 25 years' standing and repute as you have stated, would you have put down the figure in the estimate of 1919 at two-and-a-half times the original figure?

A.—My own estimate?

Q.—Yes.

A.—If it were based on a previous estimate of my own?

Q.—Yes.

A.—That, of course, is important.

Q.—You are comparing your own figures of 1913 with 1919?

A.—That is what I mean.

Chairman.—Mr. Halcrow says: "If in 1912 I have given an estimate for so much, then in 1919 I would have multiplied it by two or two and a-half times, but if somebody else in 1912 had given an estimate, I am not prepared to say I should multiply that by two or two and a-half times."

Mr. Billimoria.—Very well.

A.—Just to give you an instance of the variation that one meets with in preparing estimates for civil engineering works, I do not think I exaggerate when I say that in all the tenders which I received for works during the last three or four years, the difference between the lowest tender and the highest tender prepared by experienced contractors has varied up to 100 per cent. Therefore contractors differ in their estimate of works by perhaps 100 per cent.

Chairman.—Some are in a hurry to get rich.

A.—I thought that might help you.

Mr. Billimoria.—I am quite prepared to accept your answer so far as it goes, but what I am suggesting is this: Suppose an engineer of very great repute had prepared an estimate whose figures had been considered to be thoroughly reliable, whose estimate had undergone scrutiny and examination from another independent expert, if those figures had been submitted to you thereafter, having regard to the circumstance that prices had advanced beween 1913 and 1919, would you not have proportionately increased your figures in the estimate which you submitted in 1919?

A.—No. I would accept no figures of any other estimate until I examined them in detail myself.

Sir Frederick Hopkinson.—Hear, hear.

Mr. Billimoria.—In order to examine the figures in detail, how long would it take you to inspect the estimate on a project of such a magnitude as this?

A.—I do not know whether it has been brought before the Committee at all, but the preparation of estimates by engineers or by contractors is an entirely different matter; there is a very big difference. I can speak with some authority because, as I have already explained, I have been on both sides of the house.

Chairman.—It has been explained to us quite clearly.

A.—On the point of taking the estimate on schedule prices, I should be prepared to criticise it on the information given here, because they give the schedule rates annas 5, 6 or 8, and so on, whatever it may be for the cubic yard; but in a contractor's estimate it is quite different. If it has been explained, I need not do it.

Sir Frederick Hopkinson.—You could not criticise it unless you knew a great deal more about it.

Chairman.—As a contractor you could not give a price for a work on the information contained in that report only?

A.—To base a tender on this—no, I do not think so. One would base it on the contract drawings specification and schedule, on which to prepare a tender.

Sir Frederick Hopkinson.—And, moreover, the conditions of the site?

A.—An examination of the conditions of the site to prepare the tender is wise, though one has heard of cases where contractors take on large works without having seen the place at all.

Q.—They are not wise contractors?

A.—I would agree with you there; but that is not an unknown case.

Mr. Billimoria.—Your answers are not answers to my question at all. What I want to get from you is this: If you were not relying on somebody else's estimate, and you were called upon to submit an estimate on a work of such vast magnitude as this, where you say you would not do it without a thorough investigation on your own account, how long would it take you to do it? That is my question to you.

A.—To make a report and estimate on a work of the magnitude of Back Bay I should personally like something in the region of six months, if I could get it. That is speaking for myself.

Chairman.—Six months' personal investigation on the site and going all over the place?

A.—Not necessarily stopping there for six months.

Q.—But collecting information in great detail from there?

A.—Collecting information might only take a few weeks. I can give you an instance where my services were borrowed by a firm of contractors to go abroad and report to them on all the local conditions, and I was in that country, I think, for five or six weeks. On my report they based a firm tender running into millions of sterling before the war on pre-war prices. That was considered by the contractors sufficient time for me to remain there and make my report.

Sir Frederick Hopkinson.—That is on the assumption, and is bound to be on the assumption, that they had confidence in you.

A.—Well, I must assume that from the fact that they specially asked me to go from my firm and go out and do that work. That was a period of five to six weeks in the country. Of course I worked very hard, and I got all the information, and then I wrote my report.

Mr. Billimoria.—If you had done it in a lesser period, that report would be simply perfunctory or superficial?

A.—No; I think it depends a good deal on who is doing it. One engineer might do it very quickly and grasp the facts quickly—he might be very quick at grasping the principal points and assembling his facts; whereas another engineer might take very much longer. I do not think one could definitely state the time to be allowed for making that report.

Q.—How long would the most brilliant head in your profession take? You say there is an engineer and an engineer, and I quite admit that. But how long would the most brilliant head take?

A.—I am afraid that would be pure guessing on my part.

Q.—You have given us a period as six months with your vast experience of 25 years.

A.—I have given you a definite case which I thought perhaps might help you, of a much larger work than the Bombay Back Bay reclamation scheme. I am talking about 17 years ago, 1909. The figure there was something like £4,500,000, which represented work of a magnitude of about £9,000,000 to-day. For the contractors to put in their firm tender on that I was some five or six weeks in the country concerned. Is that a guide to you of what I mean? That is what I myself would do.

Q.—If you were called upon as an expert engineer with your vast experience, having done work of such magnitude, to report upon a report of another skilled engineer, how long would you take to do it and to criticise his report, go into details, and thoroughly investigate it for the purpose of advising your employer?

A.—May I take a recent case again? I have recently reported on a scheme got out by another engineer on the Continent of a magnitude of about £2,000,000 sterling. All the plans, all the papers and all the documents were put before me. I think that from the time they reached my office to the time that I sent out my report—and during that period I was engaged on many other works at the same time—it would be about five weeks.

Q.—During those five weeks would you exhaustively go through all the matters? Would you test the figures, or would you superficially glance through them and accept them as correct?

A.—The information placed before me was very full; it was not all that I wanted, and I had to delay once or twice to obtain further information. Having got that, I had all that I required.

Q.—Assuming that you were in the position of an independent expert advising your employer, no matter what materials are placed before you, would you rely on those materials?

A.—I understand your question to be that if a report and facts and plans were placed before me, how long would I take to go through them?

Q.—As an independent expert advising your employer?

A.—As an independent engineer reporting on them—I tried to give you a recent instance.

Q.—You said you would take about five to six weeks?

A.—That is what I took on this occasion.

Sir Frederick Hopkinson.—Did that include a visit to the site?

A.—That did not include a visit to the site.

Mr. Billimoria.—If you were not to accept the various plans, estimates and figures therein, and thought it would be necessary to modify them in a certain measure, and not accept everything in the data, how long would it take?

A.—Well!

Q.—An attempt has been made to say that on certain matters the report has been accepted, and on other matters the report has not been accepted. I want to make myself perfectly clear to you. I do not want to keep back any cards; I am placing all the cards on the table.

A.—I am not suggesting that. I simply say it depends so much on the individual. I have tried to give one or two cases of my own experience. I do not know that I can say very much more to that.

Chairman.—It is rather like Counsel's opinion in a very voluminous case. Some Counsel might work the greater part of each day for six or seven weeks, and then give an opinion. A Counsel with a quicker brain and able to retain the facts might give an opinion in three weeks. There may be some Counsel who would never be able to give any opinion of any value at all in six months.

Mr. Billimoria.—I quite appreciate your point. But where the report has to be digested, and a part of that report has to be accepted as correct, and the other part is to be challenged, would not it make a difference in arriving at the conclusions in the sense that it would require some greater length of time? If I was reading this document and I accepted it as correct I could express an opinion, as you say, within a certain specified time. But if I agree with two pages of the report and disagree with the remaining portion of it, in order to arrive at my conclusions and make definite recommendations it must necessarily take some time, because it would mean a matter of working out the details, would not it?

A.—On the question of time, at the risk of repeating myself, I am afraid I must again say that it depends almost entirely on the individual and his individual experience.

Sir Frederick Hopkinson.—There is another point which cropped up a day or two ago. That report included an estimate. There are two kinds of estimate, as Mr. Halcrow knows quite well. One is that which is made by a contractor under which he is compelled to carry out the work; and the other is made by an engineer under which he can get supplementary estimates. They are totally different things, are not they?

A.—Yes; they are totally different things, because an engineer as you so well know, if I may say so, always handles schedule rates.

Q.—He always knows that a supplementary estimate can be obtained. I am pointing out that is the difference between his estimate and that of a contractor.

A.—But apart from the question of supplementary estimates, we have known cases of contractors getting extras on their contract.

Q.—No; not if they are finally able to carry them out—I do not agree with you at all.

A.—I am able to speak of the handling of schedule rates from experience. If an engineer goes to a new country one of the first things he does is to make enquiries as to the cost of work locally. He does not ascertain, first of all, the price of labour and how many yards of excavation a man can do per hour. He deals with the finished schedule rates which include everything; but a contractor who has to put in a firm contract——

Q.—A clinching document?

A.—Yes—he starts off, if I may suggest it, with the postage stamps he is going to pay for in his office.

Q.—Precisely.

A.—Tenders for works which I have been engaged on may run to 150 pages of foolscap, taking the details right the way through. Whether the results which he obtains at the end is of greater value than the engineering estimate, is another matter.

Q.—Do you say it is another matter?

A.—Because the contractors vary so much in their tenders, as I have already said this afternoon. The tenders vary very much from the lowest to the highest.

Mr. Billimoria.—In answer to Sir M. Visvesvaraya's question you said while you were in Bombay a specimen of clay was exhibited to you?

A.—Yes.

Q.—You found that material was quite suitable, did not you, when you examined it?

A.—Yes.

Q.—It was suitable material?

A.—Yes.

Q.—When did you first know that the material was unsuitable?

A.—I do not know that I know that now.

Chairman.—He was away before the dredging commenced.

Mr. Billimoria.—But he takes a sample of clay that was shown to him from the bed of the sea.

Chairman.—Quite so.

Mr. Billimoria.—You thought that material suitable?

A.—I considered it suitable.

Q.—When did you know that the material that was dredged from the harbour was unsuitable.

A.—I do not know that I know it now.

Q.—You do not know it now?

A.—No.

Sir M. Visvesvaraya.—Mr. Settle knew, because he has stated it in his statement.

A.—That comes in Mr. Settle's evidence. He has seen the pumping taking place. I have not seen it.

Chairman.—Anyhow, you say you do not know.

Mr. Billimoria.—So that the various conclusions you have arrived at in your report are based upon something that you have heard, and of which you do not personally know?

A.—I saw a sample of the mud, as I say, and I have also had experience of reclamation which was carried out by pumping mud and silt on shore; and that reclamation was successful.

Q.—Which reclamation are you referring to?

A.—The one I was connected with in the Straits Settlements.

Q.—Here, when you are arriving at certain calculations and expressing a definite opinion, you do so on certain information, not on your own personal experience and knowledge?

A.—I have said that I have seen a sample of it—a small sample, it is true.

Q.—I am not asking you about the clay, but generally. If you do not know anything about the unsuitability of the clay, it necessarily follows that all the various opinions that you have expressed in this document before us now are based upon hearsay information, and not on your own personal knowledge?

A.—You mean it is not based upon seeing the material in the reclamation? I have not seen that. I have not been in Bombay since the pumping commenced.

Q.—You have not been very closely associated with the progress of the work?

A.—No. This Back Bay scheme is essentially Sir George Buchanan's scheme. In a firm like ours each partner has his own work and his own clients to deal with.

Q.—That is right.

A.—In this case I have discussed matters with Sir George Buchanan frequently. The only occasion on which I had to step in and take action was in the spring of 1925, and I have tried to show what I did in the matter of speeding up the dredging.

Q.—If you were not specially connected with the scheme, but were occasionally consulted on certain matters, what prompted you to come before this Committee with this document and give evidence to-day? What is the reason of your presence here to-day?

A.—I was invited to come. I was asked if I would give evidence, or give any information as to what I knew about the work.

Q.—By whom?

A.—By Sir George Buchanan.

Chairman.—About the visit to Bombay?

A.—About the visit to Bombay.

Mr. Billimoria.—You have gone far beyond your visit to Bombay. You have not confined yourself to Bombay. You have expressed an opinion on things on which you have no personal knowledge.

A.—Can you give me a case?

Q.—Everywhere you have expressed opinions, and now you say that you know nothing about it.

A.—No; I think not. Can you give me a case where I am expressing an opinion?

Q.—In the course of your evidence to-day you have stated several matters of opinion which you arrive at which are based upon information, and on which you had no personal knowledge of the things.

A.—It depends upon exactly what you mean by " personal knowledge." If personal knowledge is to be confined to being in Bombay, that is limiting the expression very much. One may have personal knowledge by being in close touch with the people who are engaged on the work, and seeing the papers about it.

Q.—What I want to find out is, if you were confining yourself merely to your visit to Bombay, I can appreciate the trouble you have taken in coming before the Committee; but if you are going beyond that and expressing certain views, I want to know where you get that information from, as it is not from personal knowledge.

A.—It is my personal knowledge in this way, that I have had frequent conversations with Sir George Buchanan.

Q.—That is, I think, hearsay. That is one thing. I hear from my clerk something, and I base my conclusions on that. That is what it comes to?

A.—No; I do not think I could agree with that.

Q.—Very well. We will leave it at that. In the course of your conversations and your perusal of documents you may have known that the whole of the reclamation was anticipated to be completed by the end of 1926?

A.—That, I think, was the original report which has been revised to 1930-31 by the Development Department.

Q.—If your recommendations are followed perhaps we may not see the end of it till 1954; but that is not our concern. You anticipated that the whole of the reclamation was to be completed by the end of 1926 originally?

A.—That is in Sir George Buchanan's report. It was all before my time.

Q.—Although we are at the end of the year 1926, you know also from hearsay knowledge, which is not your personal knowledge, that not even 25 per cent. of the work has been completed?

A.—Of the dredging?

Chairman.—It is as 4 is to 25.

A.—Yes; it is about 16 per cent.—I have that figure in my statement—as against the estimate here of 30 per cent.

Mr. Billimoria.—On page 18 of your note you say Sir George Buchanan remained in Bombay for a longer period than was necessary in your opinion, and certainly much longer than you have ever known an engineer for large works to stay. On what authority do you make that particular statement?

A.—My experience.

Q.—Do you know what the contract between Sir George Buchanan and the Secretary of State was?

A.—I have read it.

Q.—The words used therein are " several months." Would you call a couple of months " several months "?

A.—I have not got a copy of it before me, but I do not think it says that.

Mr. Billimoria.—It says so in Sir George Buchanan's own note of his interview with Mr. Montague.

Chairman.—But not in the contract.

Mr. Billimoria.—The basis of the contract was the informal interview with Mr. Montagu, Secretary of State for India.

A.—I have no knowledge of those interviews.

Chairman.—The contract said for such period during the working season as he or the Government of Bombay should think necessary.

A.—Those are the words I remember.

Sir M. Visvesvaraya.—That is generally; but in the understanding with the Governor it was put as much longer. " Several months " are stated in his own statement.

A.—But not embodied in the contract.

Mr. Billimoria.—" Undertook to spend a few months every year in Bombay."

A.—But that does not appear in the contract.

Sir Frederick Hopkinson.—I have found the reference to moorum. In Sir George Buchanan's estimate of 1919 he gave 1,830,000 yards, and in his report of February 11th he gave 3,360,000 yards.

A.—Thank you.

Mr. Billimoria.—You are referring to the agreement. I shall read one other clause: " Work in India. During the whole period the execution of the work shall be closely supervised by the firm, and Sir George Buchanan shall devote the greater part of his time to this particular work." Does that mean that he had to devote a longer time, and that

your opinion, which may be worth a good deal in your own sphere, does not count having regard to that agreement?

A.—I do not read the agreement to mean that he had to spend the greater part of his time in Bombay. After all he had a lot of work to do, and he was engaged on the Back Bay work in this country.

Q.—After the reclamation work had started, what was he doing in this country?

A.—He had a great deal to do. There was all this question of ordering the plant, and matters of that kind—there was a lot of work entailed in that—and all the correspondence with the Department.

Q.—You have no knowledge of the interview with the Secretary of State?

A.—None.

Q.—Turning to page 19, you state : " There are ample quantities of filling material in the Harbour and Back Bay."

A.—Yes.

Q.—Where do you get that information from?

A.—From the evidence.

Q.—That is also hearsay?

A.—I am taking it from the evidence.

Q.—I ask you to give instances of what you base your conclusions on, and I say you base your conclusions on hearsay—nothing from your personal knowledge or experience?

A.—One gets one's knowledge from reading.

Q.—That is hearsay; that is not personal knowledge.

A.—Well, am I to understand that I should not believe anything I hear with regard to the quantities of material in the Harbour and Back Bay unless I went there and bored the site myself and took all the sections? Is that what you infer?

Q.—No; but what you are suggesting here is that there are ample quantities. I want to know where you get that from, from your own knowledge, or from what somebody has told you about it?

A.—From what I have read. There are all the original quantities which have been taken out from Bombay, both in the Harbour and Back Bay. This afternoon the quantities have been mentioned here as being 21,000,000 yards and 25,000,000 yards as the material available in the Harbour and Back Bay, which makes 46,000,000 yards. Apart from the bulking of the material in the reclamation, the figure usually given as the required amount to dredge is 25,000,000, which is only about half the quantity which is available. So on those figures I do base this statement, " There are ample quantities of filling material in the Harbour and Back Bay."

Q.—So that you honestly believe there are ample quantities of material?

A.—This information has been sent home by the Engineer out there. Why should I doubt it?

Q.—Could you then explain the cause of the failure of the scheme?

A.—I do not admit that there was a failure of the scheme.

Q.—This was a scheme that was expected to be completed in 1926. We are at the end of the year 1926, and there is no sight of the end of it at all. This was a scheme that was expected to be completed on an estimated figure of 367 lakhs; and now it could not be completed, irrespective of interest and depreciation, for anything less than 1,000 lakhs. Should you not call that a failure?

A.—I do not admit those figures.

Q.—What figures would you admit?

A.—The nearest figures that I should take from the evidence—that is all that I have to go on—are the figures I have put down.

Q.—Do you mean the figures on page 21?

A.—Yes.

Q.—How do you base your calculations there? Where do you get the figure from of 470 lakhs, and so forth?

A.—I take that from the evidence.

Q.—How do you arrive at 606 lakhs?

A.—By adding thereto the Development Department's estimate to complete the works, amounting to 39 lakhs, and to that again the dredging, at a working cost of 7 annas, which shows an improvement of 1 anna per cubic yard for a part on what they state in the evidence it has cost. Multiplying 21,000,000 yards by 7 annas gives you 93 lakhs; and the total comes to 606 lakhs.

Q.—In reply to Sir Frederick Hopkinson you have already admitted you have assumed certain things. It is on a certain assumption that that data has been based. What is the value of the assumption and the estimate based on it?

A.—It is taken from the evidence. It is stated in the evidence that the cost of dredging was 8 annas.

Q.—Not all round?

A.—That is how I understood it when I read it.

Sir Frederick Hopkinson.—It is harbour dredging only?

A.—Is this harbour dredging only?

Q.—Yes, 8·3.

A.—8 annas 3 pies.

Q.—That is all. That is harbour dredging only?

A—On that, on their own statement in the evidence that they can improve the output by 50 per cent., I am right in assuming that if the output is improved, the unit cost will come down.

Q.—Assuming their assumption is realised?

A.—On the evidence given that they are working 15 hours a day instead of 24.

Q.—They had no intention of working 24 hours a day when they made that assumption?

A.—I gather you have recommended it.

Q.—That is subsequently?

A.—Yes. That shows that my view coincides with yours, that 24 hours should be worked. That is 50 per cent. increase in time.

Q.—No, it is not.

A.—And if they state that the dredging is costing 8 annas 3 pies, and if they are to improve the output by 50 per cent.——

Sir Frederick Hopkinson.—No, they are not. They do not expect to; they do not hope to. I should not expect them to.

Sir M. Visvesvaraya.—They have already said that they worked longer hours than 15, but all they can pump is for 15 hours?

A.—Clearly if they worked the whole day round instead of working 16 hours only, there must be an improvement. I also see they stop for meals.

Sir Frederick Hopkinson.—You would not expect to get the same results at night that you get in the daylight, as a practical man?

A.—Then you would not, perhaps, get the same efficiency at night.

Q.—Of course you would not.

A.—But you can get over the great drop in efficiency, which I understand Mr. Settle is going to produce evidence of, by making it worth while for the men to do their best. That is a point which I consider very important indeed. That helps to level up the difference between efficiency at night time and during the day time.

Mr. Billimoria.—I will ask you one simple question. If your figures are based upon something which has been assumed, and that assumption is not correct, the results that you arrived at are absolutely incorrect, is not that so? If you have assumed something and that assumption turns out to be incorrect, your conclusions are incorrect?

A.—It depends to what extent they are incorrect. If there is only a slight difference, the difference in the total will be small, but if there is a great difference between 606 lakhs, which I suggest here, and the estimate for the engineering works of 1,000 lakhs, which you put——

Q.—You think by dredging the whole work is completed; but there are overhead charges and various other expenses which you have not taken into consideration. There are various other things to be done before you can complete the work. None of those figures have you taken into account in arriving at your figure of 606?

A.—Have not I taken that from the Development Department estimate?

Q.—The cost of dredging does not include the entire cost of the reclamation. Even assuming the 7 annas, it is only the cost of the dredging. That does not mean the whole reclamation expenditure?

A.—It does not include everything, as I think I have made quite clear in my statement.

Q.—You say the total cost of completing the reclaimed area?

A.—It is only for the items which are in my statement. That is only for the filling.

Q.—You say: " The total cost of the reclamation at about 606 lakhs of rupees and without allowing credit for the sale of plant "?

A.—That is excluding moorum, filling, and the town planning. I think I have made that quite clear in my statement.

Q.—Your statement speaks for itself. These figures are merely assumed figures and have no bearing on the question. On page 20 you take exception to the action

taken by the Bombay Government with regard to the Advisory Committee being appointed to investigate the activities of the Development Department with its Chairman, the Director of Development. Why should you take exception to that?

A.—It seemed to me to be a curious thing if the Bombay Government appointed, as I understand it, an Advisory Committee to investigate the activities of the Development Department, that they should appoint as its Chairman the Director of the Development Department. That is all. It seems to me to be rather curious.

Q.—He would help the Committee a good deal with his personal knowledge of the inner working of the Department. He would place the facts and the materials before the Committee so that it could come to a definite conclusion. It is usually done by the Government of India in all Departments. When the Legislative Council brings forward a proposal in the House it is always the General Member or the Member in charge of the particular Department who presides over the deliberations of that Committee so that he can help them.

A.—The idea is somewhat strange to me. I would have thought that the Director of Development should have given his assistance in giving evidence before that Advisory Committee, and not been its Chairman. That is the only point. It struck me as being rather curious.

Q.—It is not unusual.

A.—You tell me it is not unusual in India.

Q.—At the conclusion of your note on page 21 you say: "The area to be reclaimed is 1,145 acres, or 5,541,800 square yards," and you base your calculation on 20 rupees a square yard on the whole area. You must be aware that the area available for building sites, after providing for roads and open spaces, is only 22 lakhs, and therefore your figure of 11 crores has no bearing whatever on the scheme being commercially successful?

A.—I have taken this from the evidence. I had a doubt whether I should go into this at all, because it is outside my province, but I could not help putting it in as I was rather impressed by the figures. Is not it the case that they are getting 20 rupees per square yard for the military area?

Q.—It is quite true, but not for the whole of the area.

A.—That is a large part.

Q.—That shows how imperfect your knowledge of the whole case is, that you have based your calculations upon something of which you have no personal knowledge. Then you have forgotten one of the principal items, namely interest and depreciation. Does not interest form a very important factor for consideration with regard to making a project profitable or otherwise?

A.—I state here I have excluded interest, in the last line.

Q.—That is so. If you were to take interest into account when you know that the project is going to take years and years for completion, that project can never be a success commercially if interest piles up year after year. You will agree with me that no such project could ever be a success under such circumstances?

A.—Well, as you say, it is rather outside my province, this question of land values, so that it would not be right for me to say that I agree with that without going into it in detail.

(The Witness withdrew.)

57th Witness, Mr. J. Risley Settle, M.Inst.C.E.

Written Statement.

1. My experience in the design and construction of large civil engineering works has been obtained, as follows:—

The Manchester Ship Canal, from inception to completion, 1882 to 1894;

The Admiralty and H.M. Gibraltar Dockyard Extension Works, inception to completion, 1894 to 1908;

Messrs. Topham, Jones and Railton, Ltd., Public Works Contractors, 1908 to 1916;

Director of Naval Works to the Commonwealth Government of Australia, 1916 to 1922;

and since 1890 or 1891, when the two small bucket dredgers, "Medlock" and "Irk," I believe they were named, were erected ready for work in the bottom of Salford Dock, up till 1922 I have been more or less closely connected with bucket and cutter suction dredgers and dredging operations.

2. In accordance with instructions received from Messrs. C. S. Meik and Buchanan, I proceeded to Bombay to look into the question of the dredging in connection with the reclamation of Back Bay.

3. I arrived in Bombay on 8th November, 1925, and left there on 5th December, 1925, on my return to London.

4. On Monday, 9th November, in company with the Chief Engineer (Mr. Elgee) and the Deputy Chief Engineer Dredging (Mr. Brims), I inspected the intermediate pumping vessel " Colaba," which was working in tandem with the " Sir George Lloyd," pumping dredged material into area No. 8 of the reclamation at Colaba. On approaching the vessel, when at some little distance from it, I noticed a movement of the outer casing of the fore funnel and an agitation of the water around the vessel which extended for some considerable distance fore and aft, due to the excessive vibration when pumping. Shortly after arrival on deck, at the invitation of the Chief Engineer of the dredger, and under his guidance, I examined closely the defects in sight, caused by the vibration, on deck, in the engine and boiler rooms, including the engine seating, the plating of the oil tanks, and some parts of the bilges. After the inspection Mr. Brims asked me what I thought of it. As he had told me previously that the matter had been referred to the local experts of the Royal Indian Marine Dockyard, and as I had no executive authority but was merely inspecting on behalf of my firm, I did not feel at liberty to state more than that; as the defects were under the consideration of the Royal Marine officers, it was for them to give their views. Had I been vested with authority I should not have permitted the vessel to work, and it was a matter of surprise to me that Mr. Brims permitted work. That Mr. Brims was uneasy was clear, for he asked me for my views more than once. Ultimately, the Chief Engineer (Mr. Elgee) decided that the vessel was to be put out of commission for repair on the termination of the second shift, or at midnight of that day.

5. Pumping operations for season 1924-25 finished at midnight on 15th May, 1925, and were resumed at the end of October, 1925, for season 1925-26. On the 9th November, after pumping for only 178¾ hours, or not for more than two weeks, following a lay-up period of about 5½ months, the " Colaba " was again laid up for repairs which should have been done during the previous lay-up period, as, in so short a time, the defects due to the vibration of the vessel could not have become worse than they were on 15th May, 1925.

6. If the local expert opinion had been obtained in May, 1925, it would most probably have recommended, in addition to the lattice stiffening of the deck sent out by Messrs. Wm. Simons and Co., the same work for remedying the effects of the vibration, as they recommended in the November following, and thus the loss of at least 17 days' dredging would have been saved.

7. The " Kalu," after dredging fruitlessly through the season 1924-25 at a spot in Back Bay, resumed dredging operations on 15th November, 1925, at a different spot from that of the last season, though Mr. Brims informed me that she was dredging the sand which had accumulated in the hole dredged the previous season. On the resumption of these operations, the material was pumped into Area I at Marine Lines. Up to the time of my last visit to the " Kalu " the material pumped was being taken out to sea by the ebb tide. The facts above stated indicated to me that there was no proper supervision, and that no interest was taken in the work.

8. No tests whatever of the pipe-line discharge had been taken prior to those taken during my visit. It is usual to make periodical tests where suction-dredging operations are being carried out, even when the work is known to be satisfactory, but it is imperative to take tests when the operations are not satisfactory, as they are the only true day to day guide as to what is taking place and what is the cause of it. Intelligent direction and supervision of dredging operations such as these are impossible without the guidance of periodical tests of the discharge, as, no matter how frequently made, mere mechanical visits to the pipe line and dredger do not help to solve the problem involved in unsatisfactory operations. Suggestions for the taking of tests and the arrangement for the payment of a bonus to the men of the dredger were made in our letter dated 23rd April, 1925, and further in connection with the bonus in our letter dated 26th February, 23rd July, and 16th September, 1925.

9. I formed the opinion during my visit that Mr. Brims and Mr. Speirs, Senior, were spending far more time at Mazagon Dock, four miles away, in connection with the reconditioning of the " Jinga " than was good for the dredging. During a visit to Mazagon Dock with Mr. Brims, he told me that he and Mr. Speirs, Senior, spent much of their time there, and that he had the privilege of going into the shop at any time, day or night, and of giving the shop workmen his own dredging work to do, whatever they might be working on at the time. My reply was that his work would have to pay for the privilege. During discussions with Mr. Brims on the dredging operations he repeatedly informed me that so much of his time was taken up with the filling up of forms of one sort or another required by the Department that he could not possibly give as much time to dredging as he would like. He stressed this so much on one occasion that I asked him which he considered the most vital—successful dredging

operations or filling up forms. As he replied dredging operations, I advised him to give his whole time to the operations and leave his personal assistant to deal with the forms. The dredging section had no workshop ashore at Colaba for dealing with the usual minor and moderately large dredging repairs, nor was the workshop at Colaba belonging to the reclamation section, which was well equipped with suitable machinery and power, availed of by the dredging section, the reason given being that it was under the charge of the reclamation section.

10. I spoke to Mr. Brims about working the dredger in shifts for the full time daily, but he replied, " It cannot be done," and when I asked " Why," he replied that it is against the Factory Acts, and also that three shifts could not be accommodated on board the dredger. I replied that it would pay to hire a vessel with the necessary accommodation to lie off near the dredger.

11. During my visit I remarked to Mr. Brims and Mr. Billington (the then Deputy Chief Engineer Reclamation at Colaba) on the apparent lack of co-ordination between the various sections, when I was given to understand there was none. On the occasion of Mr. Brims introducing me, on the works, to Mr. Billington, he told me that he had not seen Mr. Billington to speak to for 18 months.

12. I append hereto copy of my report, dated 30th December, 1925, to Messrs. C. S. Meik and Buchanan on my visit to Bombay in connection with the dredging and reclamation of Back Bay.

13. As questions have been raised before the Committee on the practice of proceeding with the lay-out for and construction of large civil engineering works, such as the Back Bay Reclamation, it might be helpful if I state what has been my experience on this point, and therefore I give the following particulars of the procedure adopted in the cases of the Manchester Ship Canal and H.M. Gibraltar Dockyard extension works.

14 *The Manchester Ship Canal.*—This work was let by contract in 1888 to the late Mr. T. A. Walker. At the time of the letting of the contract the only details of the canal that had been prepared were :—

(*a*) The trigonometrical, detailed and geological surveys, including levels of the canal route and five main line deviation railways;

(*b*) the staking out of the centre line of the canal and its cross-section widths for excavation purposes, and similarly for the deviation railways.

I believe I am correct in stating that only part of (*b*) was completed on the date of the contract.

Consequently the designs and working details of the locks and sluices, docks, wharves, jetties, river sluices, railway bridges and viaducts, road bridges, opening and fixed, including high-level bridges, the Mersey Estuary embankments forming the north side of canal, road, storm water and sewer diversions caused by the interception of the canal, and other subsidiary works, were prepared subsequent to the signing of the contract. The additional information of the sites required for the designing of the above items of work was obtained on the ground during the period of the contract.

The estimated cost of the canal and its subsidiary work was, I believe, about £6,000,000 at the time of signing the contract, and its cost in 1894 about £12,000,000, including purchase of land, compensation for severance, &c., and its total cost, £15,000,000.

It is my considered opinion that had even a portion of these works been designed and the usual contract plans and documents been prepared before inviting tenders, the canal would not now be in existence, for the time required to design the works and prepare the contract documents would have been so great that not only the public interest in, but also the enthusiasm for, the scheme, which had been kept alive during the period 1882 to 1887, would not have survived.

15. *His Majesty's Gibraltar Dockyard Extension Scheme.*—The works comprising this scheme, with the exception of a 300 feet extension of the existing mole, which was let by contract, was started in 1885 by Admiralty departmental labour and continued till December, 1898. The scheme at that time included only one dry dock with the necessary reclamation, a further extension beyond the contract length of the existing mole and a detached breakwater. The designs and details for these works were prepared by the staff in Gibraltar and submitted to Admiralty for approval.

Some of the plant and temporary works for the carrying out of the permanent works were considered in London by the Senior Officer and an assistant, who ordered the plant and sundry materials before proceeding to Gibraltar to take up their posts in charge of the work. Other plant and materials found necessary as the work developed were ordered as required from Gibraltar. These works were estimated to cost, I believe, $1\frac{1}{4}$ million sterling.

The increasing requirements of the Admiralty demanded increased naval accommodation at Gibraltar and as it was considered that Government procedure was not

sufficiently elastic to permit of the enlarged scheme to be carried out departmentally, it was decided to let the works to contract. Consequently, contract drawings and documents were prepared, tenders invited, and contract was let in December, 1898. The contract drawings did not cover all the subsidiary works required, and consequently special provision for them had to be made for their execution; the designs and working details of some of them were prepared by the local staff during the period of the contract and submitted to Admiralty for approval. The works were completed in 1907 at a cost of about 5½ millions sterling.

In connection with the questions raised before the Committee on the horse-power of the " Sir George Lloyd " as being a factor in its output, it was stated that the cause of the low output lay in the difference of the horse-power between the horse-power of the American dredger proposed by Mr. Kidd and the horse-power of the " Sir George Lloyd." The true reason for the difference of the respective horse-powers will be found most probably to be that in American practice the horse-power is the total horse-power of the vessel, that is, of the propelling engine, pumping engine, winches and ladder engines and the various auxiliary steam units which together make up the complete steam unit, or, in other words, the horse-power of the boilers. In the case of the " Sir George Lloyd," the horse-power given was that of the pumping engine only.

27*th October*, 1926.

Report of Mr. Risley Settle on his Visit to Bombay, 1925.

16, Victoria Street,
Westminster, S.W.1.
30th December, 1925.

Messrs. Meik and Buchanan,
16, Victoria Street,
London, S.W.1.

Dear Sirs,

Further to my report of 12th November, 1925, the Chief Engineer decided, on Monday afternoon, 9th November, to cease work with the I.P.S. " Colaba," on the completion of the second shift at midnight on that date, and consequently to move the dredger " Sir George Lloyd " to the dredging area west of Oyster Rock, where it was expected dredging operations would be resumed towards the end of the following week. Arrangements therefore were made at once to move the dredger and so much of the pipe-line as was required immediately to the west side of Oyster Rock, and dredging operations were resumed on Wednesday afternoon, 18th November, but efficient work was not done till Saturday, 21st idem.

As the object of my visit to Bombay was to get a grip of the fundamentals of the dredging position and problem, it was impossible to obtain these owing to the temporary cessation of dredging, except to note generally the operations of moving the dredger and assembling and reconnecting the pipe-line for work in the new position. I therefore used the major portion of this interim to inspect the construction works and quarry and to try to obtain as much information as possible of the material in the dredging area lying to the east of Oyster Rock. My object in obtaining this latter information was particularly great, because I found from time to time, when generally discussing the dredging question, that the admittedly unsatisfactory position of the dredging was due to one or all of the following three causes :—

(*a*) The unsuitability of the material.

(*b*) The difficulty of obtaining the material owing to the uneven level of hard material, moorum, which the dredger cannot deal with, and consequent loss of much time in lifting and lowering the cutter.

(*c*) The unsuitability of the men, assistant dredging masters, &c., sent out from London.

When generally discussing the dredging and its unsatisfactory conditions with the Chief Engineer on Tuesday, 10th November, he told me that he thought everything had been done that could be done to improve the position, and it had only to be considered that the work was being directed by two experienced men like Brims and Speirs, especially Speirs, and he himself was not without dredging experience, to realise what had been done with regard to dredging the material in the dredging area. I told him that, if possible, I would like to obtain a sample of the mud of the dredging area without its coming in contact with the water and have it analysed for its physical characteristics.

After discussing the difficulties which he said stood in the way of obtaining this information, and my mentioning that the material might be referred to Mr. Mitchell for analysis, he said he thought that there was no need to refer it to Mr. Mitchell as it could be done in his office. I have brought back with me two samples of the material obtained by Mr. Speirs, Senr., and myself for physical analysis, if it be considered desirable. The samples are in two cigarette tins, hermetically sealed with solder, so that the material might be kept as far as possible in its natural condition. I have also

brought samples of the clay as obtained from the solid material discharged and heaped up around the discharge pipe ends.

I told him that I had read a letter in the office file of correspondence from Mr. Lewis, his predecessor, to Sir George, in which Mr. Lewis stated, in reference to the material in the dredging area, that " it had been reported on unfavourably by technical experts," and I asked him if he knew anything of the report or who the technical experts were. He replied that he did not and he could not say whether or not it was Mr. Mitchell. In the afternoon (Tuesday) Mr. Brims and I called on Mr. Mitchell at his laboratory and we had a long discussion with him on the suitability of the material, for dredging and reclamation, which is being dredged in the harbour. I explained to him the difficulty, as represented by the Chief Engineer and Mr. Brims, there would be in obtaining Government sanction to the expenditure of funds necessary to refer the sample of the materials to him for analysis, when Mr. Brims said : " To do so would undoubtedly raise very awkward questions at the present time and generally affect the works politically, and it would probably be asked why it is now considered necessary at this late stage to analyse the materials, which, if necessary at all, should have been done at the commencement." I told Mr. Mitchell that as the unsuitability of the material from the dredging point of view is being repeatedly put forward as an explanation or cause of the unsatisfactory output, and particularly as Speirs, Sr., asserts " that the first 10 feet below the surface of the ground is all silt, very largely organic, which, when dried out, is blown away by the wind," it is very desirable to obtain some definite physical information or tests of the material, and I asked him if he could help, under the circumstances, by giving in general terms his opinion on the matter. Mr. Mitchell said he had not tested the material in the area of the harbour being dredged over by us, but he considered there should not be any material difference in the nature of the materials from those in the area tested by him for the Bombay Port Trust, and he would be pleased, if the Engineer to the Bombay Port Trust had no objection, to let us read his (Mr. Mitchell's) report, or perhaps the Engineer himself might give us a copy of the report. Mr. Mitchell, in further explanation, said that all the material in the harbour had been brought down by the same creek or creeks, so that the material in our dredging area would be similar to but finer than that in the Bombay Port Trust area, as it is farther down stream than the latter. He therefore believed that the mud or silt was extremely fine sand and in a more or less buttery condition, and consequently, he thought, could not be considered the best material for reclamation purposes. It had a great affinity for water and could not under its natural condition of lying in the reclamation, be made to give up its water content. He stated very definitely that he did not agree with Speirs' opinion, as the material in the harbour was of trap rock. I told him about Mr. Lewis's remarks with reference to the unsuitability of the material, and asked him if he had tested and reported on the material. He said he had not, and he thought that if the material had been tested he would have been asked to do it, or he would have known something about it.

As the result of the interview with Mr. Mitchell, Mr. Elgee arranged an interview with Mr. Maclure, the Engineer to the Bombay Port Trust, for Thursday, 12th November. After introducing me to Mr. Maclure, the Chief Engineer returned to his office, and Mr. Maclure and I fully discussed the material in the dredging area. He generally confirmed Mr. Mitchell's opinion, and in reply to my request for a copy of Mr. Mitchell's report, or failing this to give his approval to Mr. Mitchell letting me read or take a copy of the report, he agreed to the latter, and said he would notify Mr. Mitchell accordingly. Mr. Mitchell later on lent me his unsigned copy of the report, and he ultimately agreed conditionally to my retaining the copy I made of the report for our office use only. A copy of the report is appended hereto. Mr. Maclure during my interview with him showed me the tabulated and graphed results of extensive experiments which, under the direction of the Port Trust, had been carried out to ascertain the bearing power of the material in the reclamation at Sewri. He said the material itself was unstable and always would be, owing to its water content, but if topped with good moorum filling, not less than 3 feet 6 inches in thickness, he considered any light loading would be well spread and safely borne. This thickness, however, he considered quite insufficient for roadways intended for fast motor traffic or moderately heavy weights. He knew instances of the moorum topping disappearing out of sight shortly after it had been deposited, without leaving a trace of what had occurred.

The southernmost area of the Colaba reclamation is being surfaced with moorum to the finished level of the reclamation. The work was commenced on Thursday, 13th November, by tipping wagons of moorum, 100 daily, from the wall, the material being spread by contract coolie labour.

The construction plant is being assembled for repair and overhaul preparatory to being sold.

The Chief Engineer and I visited the quarry at Kandivlee on Saturday, 14th November. We were met at the station by Mr. O'Rorke, who drove us to the quarry by car, and we then walked over the quarry and through the workshops. Quarrying opera-

tions have ceased, but the excavation of moorum and filling it into wagons was in progress by contract coolie labour.

I inspected the various grades of hardness of moorum, and am of opinion that the two or three softer varieties overlying the harder moorum, if the moorum within the dredging area is similar, should be dealt with without much difficulty by the " Sir George Lloyd." Mr. O'Rorke informed me that the estimated quantity of suitable moorum filling available in the quarry is about one-seventh of the total required to complete the reclamation assuming the dredging is stopped, and that the remaining six-sevenths can be obtained without difficulty on land adjoining the quarry for which a royalty of one anna per ton would have to be paid.

The contract rate for excavating and loading the moorum into wagons at the quarry is 4½ annas per ton as weighed on the weighbridge.

The Chief Engineer, as soon as he joined me in the train at Marine Lines Station on our way to the quarry, informed me that he had received instructions to attend with me and Sir Lawless Hepper a conference with Mr. Cowasji Jehangir, at 2.30 p.m., at the Treasury Office, on our return from Kandivlee.

After being introduced to Mr. Jehangir, he spoke about the very unsatisfactory position and the heavy cost of the dredging. He was very pessimistic as to its success, and asked me what I thought of it. I told him that owing to the temporary stoppage of dredging operations due to the " Colaba " being put out of commission for the present, I had had no opportunity of observing the working of the dredger except for a short time on Monday last. He said the dredger had been working now for two seasons, and had failed to give the output she should have given and as was expected, and we were responsible. I replied, the dredger had only worked two seasons or equivalent to an actual dredging period of at most 10 months in all, with scratch crews at the commencement of the work. The 10 months' work was done in two periods of only about five months each, with a lay-up period of about seven months between them, thus breaking the continuity of the work and, therefore, the best results could not be expected as such a method of procedure is not helpful to efficient team work in the early stages of each period of the work. He said, " Well, you knew of these conditions." I further stated that as the dredger was not designed by us but by Sir John Biles, the Naval Architect to the Government of India, we were not responsible for any failure in connection with the dredger itself. That she was not only designed, but inspected during construction and tested by, and the trials conducted under the supervision of, Sir John Biles, who also, on the completion of satisfactory trials, issued the necessary certificate for the taking over of the dredger by the Government of Bombay. He then asked, " What did you, Sir George Buchanan do in connection with the design." I replied " Gave the class of material to be dealt with and the hourly output required." This at the moment seemed to satisfy him. He then asked, " why has she not given the output." I replied that, assuming the material to be dredged is suitable and in sufficient depths, I saw no reason why she should not repeat the output obtained during her trials provided she were properly handled and fed. He asked, " why was she not fed properly." I replied that a large and powerful machine, like the " Sir George Lloyd," can only be efficiently worked by good team work led by an able dredging master. He then wanted to know why they had not got them, i.e., good masters, and said Meik & Buchanan are responsible for the appointments of the masters. I replied, " No, as the men were advertised for by the High Commissioner for India." I then fully explain to him the arrangements—the appointment of a selection committee—made by the High Commissioner with the object of interviewing and selecting the most suitable applicants for the appointments. The Selection Committee comprised Sir Edward M. Cook, the late Secretary to the High Commissioner, the Assistant Secretary and myself representing Messrs. Meik & Buchanan, who were requested by the High Commissioner to nominate a representative to advise on the technical merits of the respective applicants. I emphasised the fact that the Selection Committee of three comprised two high officials of the Government of India and also that, speaking from memory, only one of the applicants had had in a small way actual suction dredging experience. He then asked, "Why could we not get better men." I replied they were probably not available. One reason might possibly be that the salaries offered were insufficient to attract the best men. He said with some surprise, " Then why was not more money offered and why did you not raise the question? " I replied we had nothing whatever to do with the question, the salaries and conditions of appointments were dealt with entirely by the High Commissioner for India. He then asked, " Why was not the matter referred to us? We would not have raised any objection to giving a substantial increase and will do it now if we can only get the men to give us the output and reduce the very high cost of dredging." He asked, " What salary would you recommend and what salary would be paid in England? Could any of the experienced men in dredging at Liverpool be obtained? " I replied the salary paid in England would be considerably less than paid here owing to the work being at home and not abroad, where probably the expense of another home

would be necessary. I also said I considered it would be much better to adhere to the present salaries and encourage the men to give better team work service by letting them feel that they were directly and liberally concerned in the output by being paid a good bonus. He said, I thought a little excitedly, " We are quite prepared to give then the bonus that has been recommended." Turning to Mr. Elgee he asked him to make it known that a bonus would be paid and to arrange accordingly.

He then referred to the " Colaba," and asked if I knew about the " Colaba " and what I thought about the report received from the Naval Architect and Engineer. I replied I knew about the " Colaba," but I did not know anything about the report. He said, " Have you not seen it? " I said, " No," as I understood it had only just been received. (Mr. Elgee here said the report had only been received in time to have a copy made to send to London.) He then asked me if I thought the " Colaba " could be put right in a fortnight. I replied I did not think it could. He then asked, " Can it be done in a month? " I replied it might possibly, but whatever is done it should be carefully considered.

He and Sir Lawless Hepper then discussed what they should do, and it was decided to send off a telegram on the matter.

Mr. Cowagsee Jehangir finally asked me when I was returning to London, and I replied in a fortnight's time after the resumption of dredging operations. He said, " But that is too short a time for any purpose." I replied I should not leave until the purpose for which I came out was completed.

Sir Lawless Hepper made some remark to him which I did not hear, but Mr. Jehangir replied that he was going away and would not return till (I believe he said) the 5th December. He then shook hands with me, and, bidding me good-bye, the conference closed.

As I heard that the Chief Engineer of the I.P.S. " Colaba " (Mr. Smith), during his recent visit home on leave, had been approached by Messrs. Simons on the matter of the " Colaba," I visited the " Colaba " again on Wednesday, 11th November, and tried to get from him what took place between him and Simons. He was very reticent and I got nothing definite from him. I told him that it appeared to me, from his replies to my questions, that Messrs. Simons must have got very little, if any, help from him. He said in reply, " I did not know how any information I gave might affect the position." I said, " Do you mean your position here? " He said, " No, generally." He told me, however, that a Mr. MacGreggor, an official of Messrs. Simons, sent a message to him through his (Smith's) brother, who was an employee of Messrs. Simons, asking him (Smith) to go to see him (Mr. MacGreggor). When Smith went to the works, there were with Mr. MacGreggor the chief draughtsman and another official. I inferred from his general or evasive answers to the questions I put to him, that he was well questioned as to the conditions of the " Colaba " and that they, Messrs. Simons, were much concerned about her.

When going round the construction works at Marine Lines on Monday, 16th November, with Mr. Abdulla, the Assistant Engineer, I noticed that the ebb-tide running out under the wall was carrying with it a large amount of pumped material, as the water on the sea side of the wall was very discoloured and heavily loaded with material in suspension for a considerable distance out from the wall and for a distance of about 400 feet on either side of the discharge pipe. I later on informed the Chief Engineer about this, who made some remark that I understood to refer to material pumped in the reclamation last year. I said material is being pumped in the reclamation now, and I thought it was necessary to retain all that was pumped. I also informed Mr. Brims of this, who, I believe, verified it, and after discussing it with the Chief Engineer, obtained, so Mr. Brims informed me afterwards, his approval to the tipping of a dozen wagons of moorum from the wall on the inside of the rubble mound. This quantity I considered wholly insufficient to cover the mound even with a thin layer.

Material, excavated from a site or sites in the town, was being tipped by motor lorry in the reclamation at two points—one near Marine Lines Depot, and the other immediately north of the cross bunds at Church Gate Railway Station—by a contractor. Mr. Abdulla informed me that he thought the material was costing about Rs. 4 per ton deposited in the reclamation.

On Tuesday, 17th November, I accompanied Mr. Brims to the Mazagaon Dock Company's works to inspect the " Jinga," which is being reconditioned and fitted out as the intermediate pumping station to the " Kalu," in the Company's dock at their dockyard. A large number of men were employed on the work, and the Company's works manager in reply to Mr. Brim's question stated that he thought they would finish the work on the " Jinga " in about three months.

The Works Manager (Mr. Rasmadden, I believe, is his name) pointed out to me the broken cutter of the " Sir George Lloyd." As I saw there was only one rib broken I suggested to him that the broken rib should be burnt on and built up by the quasiarc process, as it was a valuable piece of machinery and when repaired would provide a spare

cutter in case of further accident. He made no reply. Later on I spoke to Mr. Brims about it, but he said. " It can't be done." I told him I differed, as it is a very frequent occurrence at other places, as I have many times seen, and no reason is apparent why it should not be done here and save the expensive cutter from being sold for scrap value. I would suggest this matter be referred to Messrs. Simons for an opinion.

As dredging operations were expected to be resumed on Wednesday, 18th November, I accompanied Mr. Brims to Colaba to commence the discharge tests. On arrival we found that pumping had not commenced, and after waiting some time at the end of the discharge pipe-line, we left for the " Sir George Lloyd " to ascertain the position. We found the laying out of the moorings had not been completed, so we decided to visit the " Kalu " in Back Bay, as, owing to the tide, she would be unable to continue dredging after 2 p.m. On arrival, we found Mr. Speirs on the bridge and, whilst we were on board, he directed the operations. I understood from Mr. Brims that the " Kalu " was dredging the sand, which had accumulated during the last monsoon, from the hole she made during last season's work, the material in which, also according to Speirs, was sand. I told Mr. Brims that Mr. Abdulla informed me on Monday last that the " Kalu " was working in a new position about 1,000 feet out from her position of last year. He made no reply. When on board the " Kalu " on 2nd December, the Marine Surveyor came on board to take her position by sextant bearings. After he had plotted her position on the Chart I asked him what her present position was in relation to her position of last year, and he told me that as she was dredging a cut about 200 feet wide her position was 800 to 1,000 feet away from her position of last year.

Pumping operations by the " Sir George Lloyd " were resumed on the afternoon of the 18th November, though only clear water was pumped whilst the dredger was getting up to the old face of the previous dredging. On visiting the pipe line at Colaba early on Thursday morning, 19th idem, it was found that clear water was still being pumped, but as the afternoon advanced, the discharge became more heavily loaded. Mr. Brims said it would be Monday before a good working face was obtained.

As full bore could not be obtained even with clear water, due probably to the pipe line being 5,900 feet long and not 5,000 feet, the two gauges of the pitot tube would not register, as they were not sufficiently sensitive.

The pitot tube was fixed again on Friday morning for the taking of tests, but before a reading could be taken the tube was badly bent and put out of action by solid material in the discharge striking it. It was removed for repair and strengthening and for the fitting of a gauge glass to the tube instead of the pressure gauges. In the meantime the jet was very carefully measured and the results are included in the attached tabulated statement of tests.

Mr. Cole, who had arrived from Bhuj, Kutch, on Saturday last, and I had an interview with His Highness, The Maharao of Kutch, at His Highness' request, at the Taj Mahal Hotel at 3 p.m. on Friday, 20th November. The proceedings of the interview were reported in my letter dated 20th idem.

After the interview I returned to Colaba to watch the discharge from the dredger.

On Saturday morning, 21st idem, I went to the pipe line at Colaba, where I stayed some little time watching the discharge of material before going off to the dredger. The discharge was well loaded with material and a large quantity of clay had accumulated around the end of the branch pipe used during the second shift yesterday. The clay had been delivered in more or less round balls from 18 inches diameter and downwards. It was of a stiff consistency, as walking over it and even jumping on to it from the top of the pipes made only a very slight impression upon it. I then left for the dredger, where I arrived about 11 o'clock and remained on board to the end of the shift, finally leaving about 3.30 p.m. and returned to the pipe line to see the result of the day's dredging. The result was, I considered, very satisfactory, as there was a considerable quantity of solid material, clay, heaped up for some distance around the pipe end, and there was ample evidence that a very considerable amount of disintegrated material had been carried in suspension into the water area of the reclamation. The whole of the material being pumped into this area No. 8 is being retained, the clear water flowing to sea over the top of the eastern return end of Drain No. 1.

As dredging, on its resumption, was now considered to be in full operation, it was decided to commence the definite tests of discharge on Monday, 23rd November, and arrangements were made accordingly. The tests were taken on alternate days—four days in all—two tests per day, one of the day shift and one of the night shift, making a total of eight tests. These are shown in the tabulated statement. From this day till the completion of the taking of the tests on Tuesday, 1st December, nearly the whole of my time was spent on the tests and on the dredger.

As a telephone service was not provided between the end of the discharge pipe line and the dredger I pressed that one should be installed at least during the tests. As difficulty after difficulty was raised against the installation of a telephone service I suggested that it would pay to lay a submarine cable from the shore to the ship, but the usual reply that " it can't be done " was received. I replied again that it has been done

at other places, in two cases less favoured than Bombay, and it can be done here. Ultimately a line was laid along the discharge pipe and it was found useful during the tests.

The results of the tests are given in the tabulated statement from which it will be seen that of 9 No. tests, 5 No. gave an absolute minimum discharge of over 1,000 cubic yards per hour, the maximum being 1,552 cubic yards, with a pipe line 6,410 feet long.

This result, considering the length of the pipe line, was very satisfactory, and given a reasonable working face and proper feeding it shows that the dredger is generally capable of giving satisfactory output in accordance with the designed capacity.

Precipitation tests were also taken of the discharge of the day and night shifts which showed that the efficiency of the night shift output was only approximately 69 per cent. of that of the day, though the greatest individual percentage output (91·90) was obtained during a night shift, the greatest during the day shift was 79·64. These tests were relative only.

During a temporary stoppage of pumping at Colaba on Friday, 27th November, due to increasing the length of the floating pipe line, Mr. Brims and I ran up by car to Marine Lines to see the material, at low water, which had been pumped into the reclamation area by the " Kalu." We arrived there about 3 p.m., it was about low water, approaching springs, but the tide was still ebbing. In the enclosed area between Main Drains 8 and 9, which was nearly clear of water, comparatively wide and deep channels were scoured out in the surface, presumably the original foreshore, by the water flowing out of the area to sea through the rubble mound of the wall as the tide ebbed, clearly indicating the large percentage of voids in the rubble of the mound and the total inadequacy of the small quantity, 10 or 12 wagons, I believe, of moorum which had been tipped on the inside slope of the mound a few days previously with the object of preventing the escape to sea of the pumped material. On this date there was very little trace of moorum on the lower portion of the mound, any that had been there must undoubtedly have been carried out to sea on the ebb tide. I called Mr. Brims' attention to the discoloured and apparently heavily loaded state of the water on the sea side of the wall over an area of about 800-900 feet along the face of the wall and nearly the same distance out from it. When I saw the Chief Engineer on Monday afternoon I told him of this and again suggested that every effort should be made to retain every ounce of the pumped material. He said he had already given instructions for more moorum to be tipped

On visiting the " Kalu " again on Wednesday morning, 2nd December, I found the same state of affairs existing, and on returning to the office after lunch I mentioned it again to Mr. Brims and Mr. Elgee, when the latter said he gave orders last week for the tipping of moorum along the wall. Mr. Brims gave me to understand that he had had some little difficulty in getting the Chief Engineer's approval to the tipping of the 10 or 12 wagons of moorum.

On Thursday afternoon, 3rd December, I discussed, as previously arranged, on the completion of the tests, the general question of dredging with Mr. Elgee and Mr. Brims in Mr. Elgee's office. I generally explained the tests that had been made and the inference to be drawn from them. And though the pitot tube had failed us, reliance having been placed on one tube only, without spares, we had fortunately been able to measure carefully, and with accuracy, the discharge jets at the end of the pipe-line. I said that though no dredging test had been carried out under actual specification conditions owing to the discharge pipe varying in length from 5,900 feet to 6,640 feet, instead of 5,000 feet, I nevertheless considered that, judging from the tests, the dredger was quite equal to the designed duty. Mr. Elgee and Mr. Brims said that was their opinion also. With regard to the material to be dredged from the dredging area on the east side of Oyster Rock, I related the particulars about the sample of the mud Mr. Speirs, Sen., and I obtained on Tuesday evening last, and, as the result, I stated definitely that the views generally expressed about the material, particularly by Messrs. Brims and Speirs, were not supported by the sample of the material then obtained, and that I considered the materials, except moorum, and their extent almost ideal for suction-pump dredging. Further, Speirs' oft-repeated statement that the first 10 feet layer of mud over that area was no good for pumping was, in my opinion, exploded by the sample obtained. Speirs admitted that the sample of the material was better than that at Sewri, his remark being: " I could not have believed it." The Chief Engineer asked how many samples were obtained. I replied one..

I then submitted the following suggestions, which were generally discussed:—

(*a*) Working the dredger continuously without stopping for meals.

Mr. Brims argued that this was quite unworkable, and he was generally supported by Mr. Elgee.

(*b*) Fixing telephone and maintaining it in working order between the dredger and the end of the pipe-line.

Mr. Brims argued against this, and said that they had found it better to work with arranged signals between the dredger and I.P.S. " Colaba " than to use the telephone which had been provided.

(*c*) Foreman in charge of pipe-line to keep a log book, and enter therein all advices to the dredger.

Mr. Brims argued against this, and stated that he did not think it necessary.

(*d*) Foreman in charge of pipe-line to take samples daily of the discharge, say one during the morning shift and one during the night shift, at varying times from day to day, for the purpose of testing the proportion of solids in the graduated gauge glasses. Relative tests only.

(*e*) Mr. Surveyor to take, say twice weekly, systematic tests of the discharge to obtain the velocity, percentage, and hourly discharge of solid materials (Mr. Surveyor is fully competent to carry on these tests). Absolute tests.

(*d*) and (*e*) Very little non-committal comment was made.

(*f*) To raise, by means of sand or moorum in bags, a weir on the top of the shore-end part of Drain No. 1 or, by other means, to trap all the solid materials being pumped into Area No. 8 at Colaba.

Mr. Elgee said this would require to be carefully looked into, otherwise the southernmost portion of the reclamation, where moorum is now being tipped, would be under water. I learnt before I left Bombay that it had been decided to tip moorum on the remainder, the eastern end, of the inside slope of the cross bund between Areas 7 and 8.

(*g*) The employment of an engineering inspector to supervise the work of reconditioning the " Jinga " and so relieve Mr. Brims and Mr. Speirs, Sen., from this work to enable them to give their whole attention to dredging. Mr. Brims had previously informed me that much of his and Speirs' time was taken up with this work.

Mr. Brims strongly argued against this, and quoted some decision on a similar matter in Mr. Lewis' time.

(*h*) The percentage of solids discharged during the night shifts was only about 70 per cent. of that of the day shift.

When I first informed Mr. Brims of this some few days previously he expressed surprise. He now said that Speirs said it was generally found to be the case.

I then asked if they had any other matters or points in connection with the dredging on which I might possibly be able to assist. Mr. Elgee and Mr. Brims replied they thought not.

I informed them that the greater part, if not the whole, of the water area of reclamation, Area No. 8, into which the dredgings are being discharged, was very heavily loaded with material from the dredger, for on Tuesday, 1st instant, I obtained the loan of the " Mosquito " punt and men to take me as far as possible over the water area, when it was found that, owing to the density of the water, the men were only able to paddle the punt about 50 feet away from the landing place.

The water or, more correctly, liquid mud level was 87·20 feet.

Mr. Surveyor, who ably assisted in taking the tests, asked me to recommend him to the Chief Engineer for an increase of salary, and, in accordance with my promise to do so, I took advantage of this interview to recommend Mr. Surveyor for the consideration of an increase of salary. The Chief Engineer replied that Mr. Brims, who was present, had some time ago recommended Mr. Surveyor for an increase, but nothing could be done at the time. After a little reflection he added, " If Messrs. Meik & Buchanan will recommend him for an increase, I will see what can be done."

If this procedure is in order, I would recommend Mr. Surveyor's request for an increase of salary for favourable consideration.

As much has been said about the unsuitableness of the men, assistant dredging masters, &c., sent out from London, or, as Speirs, Senior, told me, by Messrs. Meik & Buchanan, I have had ample opportunity of watching the dredging masters, Roberts and Speirs, Junior, of the " Sir George Lloyd," during dredging operations between Saturday, 21st November, to 1st December, inclusive.

During the frequent visits I paid to the dredger between those dates, Roberts showed himself alert, intelligent and fully capable as a dredging master of the " Sir George Lloyd." On the occasions of my calling his attention to the vacuum gauge he has at once given the reason for its low indication. Whatever may be the cause of his unsuitableness—and his name is the only name which has been mentioned in this connection, though when reference to unsuitableness has been made it has been connected with the words " of the men sent out from London or by Meik & Buchanan " —it cannot, in his case, include incapacity as a dredging master of the " Sir George Lloyd." I was reliably informed of one occasion, after completing his dredging shift, of his visiting the pipe-line to see, as I understood he said, the progress made.

I told the Chief Engineer on Monday, 30th November, that I had watched Roberts carefully during dredging operations and I considered him a good dredging master. His only comment was, " What do you think of young Speirs? " I said there was a difference between the two men; Speirs did not handle the dredger with the same ability as Roberts. Subsequently, on my next visit to the dredger, I asked Speirs for how long he had been out in Bombay; he said two years, and in reply to further questions said he came out straight from the bench and had had no previous dredging experience. He has had, therefore, prior to this season's work, at most 10 months' actual dredging experience, spread over two periods of five months. He is now one of the two dredging masters alternatively responsible for the day and night shift working of probably the most powerful suction cutter dredger afloat.

The Chief Engineer, in his letter No. 854 of 20th March, 1925, stated that " it takes 10 years at least to train a man to work a suction dredger satisfactorily . . ."

Roberts is a 1st class Board of Trade Certificated Engineer, and was one of a number of applicants carefully selected by a Selection Committee, whereas the only qualification of Speirs, Jr., is that of having been at the bench as a fitter.

My visits to the " Kalu " were altogether too short to enable an opinion to be formed of the ability of the two dredging masters, Wallace and Brown, of this vessel owing to her working for only short periods of time daily during the days the tides were favourable.

When in the engine room of the " Kalu " I called the Chief Engineer's (Mr. Carr's) attention to a " knock " of the engine, when he said, " Yes, but it's not bad; it just wants lining up." I said, " Well, why not put a liner in and prevent its getting worse? " He replied, looking round the engine room, " We have no means of doing these things." I said, " You mean you have no workshop." He said, " Yes."

On a previous occasion I called Mr. Rutherford's (the Chief Engineer of the " Sir George Lloyd ") attention to a somewhat worse " knock " of the dredger's engine (Pump engine). He said, " It is not too bad." I said, " I suppose it will have to go ashore." I did not hear his reply.

It is not creditable to the ship's engineering staff that these small but important working defects should not be adjusted before the next week's running of the engines.

At noon on Friday, 4th December, I had, as previously arranged, a final interview with Sir Lawless Hepper. It had been arranged between the Chief Engineer and myself that he should be present at the interview, but at the last moment he said he thought it would be better if I had the interview alone with Sir Lawless.

After a few introductory remarks Sir Lawless asked me if I was satisfied with the dredging. I replied as the results of the tests, " Yes."

No further question in connection with dredging was asked, and the remainder of the interview was taken up by Sir Lawless in giving me interesting incidents of Indian life as he had experienced it.

Before leaving and on my bidding him goodbye he asked me if Sir George had not been for some time in Australia. I replied that he had been in Australia. He finally said, " Well, please remember me to him," after which I bade him goodbye and withdrew.

I embarked at 11 o'clock on Saturday, 5th December, on board the P. & O. " Ranpura " on my return to London, where I arrived on Saturday afternoon, 19th inst.

Recommendations.

As there seemed to me during my visit to Bombay to be a settled feeling that the dredging problem presented some inherent difficulty or difficulties, as exemplified by the remarks of the Chief Engineer quoted on page 2, supra, and that the direction and super-

vision seemed to lack intelligent direction and " life," I beg to submit the following recommendations for consideration as I feel sure that if a well-directed and reasonably energetic trial be made of some or all they would in a short time improve the tone and atmosphere of the work and lead to an improvement in the dredging output :—

1. That belief in the dredger's ability to do work at least equal to her designed capacity to be encouraged.

2. That the material to be dredged over the larger dredging area, east side of Oyster Rock, should be considered to be very much better than it is or has been believed to be, and that it is almost ideal for dredging.

3. That where hard moorum crops up, it should be left to be dealt with by blasting or other means if it is necessary to dredge it to obtain the quantity of material required for filling.

4. Provision of telephone between the dredger (Bridge) and the end of the pipe line.

5. Foreman in charge of pipe line should keep a log book and note therein advices made to the dredging master in connection with the condition of discharge.

6. The taking of absolute tests of the discharge, say, twice weekly, to obtain the velocity, percentage (absolute) and hourly discharge of solid materials. Mr. Surveyor is fully competent to take these tests.

7. That percentage of solids discharged during the day and night shifts should be obtained for comparison.

These tests are very simple and take very little time to carry through and should be taken daily and recorded. The results from time to time tactfully told to the respective dredging masters, day and night shifts, unconsciously cultivates a spirit of emulation. I know this has been a considerable factor in increasing the output.

Mr. Surveyor and Brooks, foreman of pipe line, fully understand all the little that is required to carry out these tests, which are relative only.

8. The employment of an able Marine Engineer, solely responsible under the Chief Engineer, to the Engineer in charge of dredging, to take charge of the whole of the maintenance work of the plant and so relieve Mr. Brims and Mr. Spiers, Sr., of this work to enable them to give the whole of their time to dredging proper.

Yours faithfully,

(Sgd.) J. Risley Settle.

Precipitation tests of the day and night shifts' discharges giving the relative percentages of solids in the discharge.

Day Shift. *Percentage.*	*Night Shift.* *Pencentage.*
—	22·41
15·84	18·27
—	14·38
40·75	12·92
22·50	14·91
79·64	14·63
18·60	91·90
23·03	26·75
71·95	24·25
7)272·31	9)240·42
38·90	26·71
100	68·66

The efficiency of the night shift during the period of these tests was only 68·66 per cent. of that of the day shift.

NOTE.—As the samples of the discharge were taken from approximately the centre of the jet, only material in suspension was obtained and consequently no account was taken (or could be taken) of the solids being discharged with lower velocity along the invert of the pipe. It is, therefore, reasonable to assume that the quantities of solids discharged given above under "Cube yards per hour" might be increased by 10 per cent.

The percentage of solids discharged were obtained after "drying out" over a spirit lamp the residue of solids measured in a graduated test glasss; and, therefore, the "cube yards per hour" of solids discharged is the absolute minimum quantity of solids discharged at each test.

Chairman.—I think you went to Bombay in 1925?
A.—Yes.

Q.—And eventually you made two reports to your firm, Messrs. Meik and Buchanan?
A.—Yes.

Q.—In the second document which has been placed before us, dated the 30th of December, 1925, you say: " My object in obtaining this latter information was particularly great because I found from time to time, when generally discussing the dredging question, that the admittedly unsatisfactory position of the dredging was due to one or all of the following three causes ". Then you set out, as the first cause, the unsuitability of the material?
A.—Yes.

Q.—That must mean, must it not, the unsuitability of the dredger to deal with the material?
A.—I beg your pardon. It was the unsuitability of the material to be dealt with by the dredger.

Q.—Is not that, as Mr. Kidd says, putting the cart before the horse, because the material is an eternal factor, is it not?
A.—It is.

Q.—You cannot alter the material. Whatever it is, there it is?
A.—Yes.

Q.—Therefore you have to adapt your dredger to your particular material?
A.—Yes.

Q.—So be it. The second cause, you say, is: " The difficulty of obtaining the material owing to the uneven level of hard material, moorum, which the dredger cannot deal with, and consequent loss of much time in lifting and lowering the cutter "?
A.—Yes.

Q.—You have got a certain depth of mud, below the mud a certain depth of clay, and below the clay, moorum and rocks. No matter how carefully borings are taken, you cannot guarantee that in any particular place you will have a perfectly level bed beneath the mud and clay?
A.—That is so: it is uneven.

Q.—It is always uneven, and the most skilful dredging master in the world will suddenly come upon a piece of rock?
A.—That is so.

Q.—And if, by chance, he injures the blades of the cutter it is no fault of his?
A.—No.

Q.—It is due to the fact that, however carefully borings are taken, owing to the irregularity of the moorum and rock, you may suddenly come upon rock?
A.—That is so.

Q.—And then the skilful dredging master passes over it. He has got to lift up?
A.—He has got to lift up, or else he breaks his machine.

Q.—He has to lift up because his cutter cannot go into this hard stuff?
A.—Yes.

Q.—Therefore he lifts the ladder, and gets it again on to dredgable material, and goes on dredging until he comes on to harder material. When he gets into the harder material he lifts again?
A.—Yes.

Q.—I notice in your report that you say that the breaking of the cutter is not a matter of unusual occurrence?
A.—Not at all. I did not wish to infer that it was.

Q.—I notice that, and that you wanted them in Bombay to have it repaired by the quasi-arc process?
A.—That is my point.

Q.—And that if they did have that one blade of the cutter repaired they would have had a spare cutter?
A.—Exactly.

Q.—You do not suggest that because you find one blade of a cutter broken that therefore there has been a careless or a negligent dredging master?
A.—No. I am sorry if I have given that impression.

Q.—You have not given that impression in any way.
A.—No.

Q.—The first point that you found them insisting upon was the unsuitability of the material?

A.—That is so.

Q.—The second point was that they found that the depth of dredgable material was uncertain?

A.—Yes, uneven.

Q.—Then the third matter, what has been called the human element?

A.—Yes.

Q.—That is when you have got to get together a crew to work a machine like a dredger sometimes you have got to train the crew?

A.—Yes.

Q.—It may take a little time. Sometimes you have bad luck in not getting a good dredging master.

A.—Yes.

Q.—Sometimes you have good luck in getting one. Do you know anything about Mr. Speirs? He was a very good man, was he not?

A.—Well, he may have been.

Q.—He was recommended, and strongly supported by the firm of Meik & Buchanan, was he not?

A.—I believe he was.

Q.—And strongly supported by Messrs Simons & Co.?

A.—Yes, I believe he was.

Q.—That is right. The only quarrel that you have with Mr. Speirs is his old age, is it not; he is getting on in years?

A.—Yes, and I think also his mentality. He has got his own ways of doing things, and no one else knows anything at all about them.

Q.—After all he was a dredging master who all his life had been doing that job and nothing else?

A.—That is so.

Q.—Have you any doubt but that he was wanting to get the best results out of the Sir George Lloyd "? He was very proud of the " Sir George Lloyd," was he not?

A.—I do not know about that I am sure; I never asked him.

Q.—We have seen him?

A.—He took pride in it, I admit.

Q.—We asked him if she was not a very good ship, and he said she was the finest dredger he had ever seen. Have you any reason to doubt that Mr. Speirs did his very best to get the best result?

A.—In coming into contact with these men and discussing points with them one forms an idea as to whether they are the right men for the position. It is not always possible to find definite circumstances or definite details upon which one can take action.

Q.—We know what the position was with regard to him. Then you had a certain conversation with Mr. Brims, and Mr. Brims wanted some of the material analysed; you remember that?

A.—No, I wanted it analysed.

Q.—You wanted it analysed?

A.—Yes.

Q.—Did Mr. Brims say something like this in reply: " Well, if we have this analysed now it will raise all sorts of awkward questions, because people will say, ' Why have you not done this years ago?' "

A.—Yes. Mr. Brims made that statement when I was speaking to Mr. Mitchell.

Q.—That is right?

A.—I was trying to get information.

Q.—And a very sage remark, was it not?

A.—I believe so now, but of course I could not realise the importance of it at the time.

Q.—Had there been a little more attention paid to the quality of the material from October, 1919, to May, 1920, the result might have been very different to-day?

A.—I do not follow that.

Q.—The report of Sir George Buchanan was in September, 1919. There were calm conditions of weather in Bombay in October, November, December, January, February, March and April. The dredger was ordered in May. Sir George Buchanan has told us that it would have been perfectly easy to have taken check borings in October, November

and December, and have ascertained exactly the nature of the material; do you follow that?

A.—Yes.

Q.—Would not that have been an eminently wise thing to have done?

A.—It would in a sense, but I think the information given in Mr. Kidd's plan was quite sufficient. In my opinion it is sufficient for forming an opinion as to the material.

Q.—Are there other methods of boring which give definite information of the materials?

A.—Yes, core borings.

Q.—Core borings bring up samples of the materials bored through, do they not?

A.—Yes.

Q.—Exactly, and core borings could have been taken in one month, in the month of October or in the month of November, which would have shown you exactly the quality of the mud. You would have brought the mud out?

A.—Exactly.

Q.—You would have brought the clay out?

A.—Yes.

Q.—You would have known whether you were dealing with soft clay or stiff clay. You would have known exactly what you were dealing with. You would have known exactly when you were coming on to the moorum, and as regards the consistency of the mud and the consistency of the clay, core borings would have told you exactly what you wanted to know?

A.—They would, yes.

Q.—And then in addition to that, borings of that character would have shown you the nature of the silt, and whether Mr. Mitchell and Mr. Maclure, and all these other people were right when they anticipated that it would never dry out. You would have been able to find that out too, would you not?

A.—Yes, but there is no question about the drying out below water level. I have seen acres and acres of reclamations formed of bad material, and I have dealt with reclamations where the material has been extremely bad, and it has been dried out in the process of reclaiming.

Q.—Yes. At the Sewri reclamation they were not able to dry it out at all because they were pumping landwards?

A.—Yes.

Q.—Have you noticed in the evidence that Mr. Maclure, speaking of the Sewri reclamation, says that even to-day the land in parts is like a blanc-mange? Have you been on the Sewri reclamation?

A.—No, I have not.

Q.—Did Mr. Maclure tell you himself that the land at Sewri was unstable?

A.—Yes, I mentioned that in my report.

Q.—Did he tell you that it always would be unstable.

A.—Yes, it would always be unstable; that is where it is below the hydraulic gradient.

Q.—And that as regards moorum you wanted no less than 3 feet 6 inches in thickness?

A.—That is what Mr. Maclure told me, and that was based on experiments they carried out under the Bombay Port Trust.

Q.—And that even with 3 feet 6 inches of moorum it would not carry more than a light load?

A.—That is so.

Q.—That is not a business proposition, is it, to reclaim land that is like a blanc-mange, on which you have to put 3 feet 6 inches of expensive moorum. Moorum is very expensive, is it not?

A.—I believe so.

Q.—You have to put on it expensive moorum and then that reclaimed land will carry only a light load?

A.—Then the question arises, in considering a pumping and reclamation scheme, as to whether there is cheaper process. I know of reclamations in Australia where the mud is infinitely worse; I use the word " infinitely " because I cannot conceive anything worse for reclamation purposes than the mud in the top or north end of Hobson's Bay. The whole of the West Melbourne swamp was reclaimed with this mud. Victoria Dock is built on part of it.

Sir Frederick Hopkinson.—Can you conceive of any worse mud than that in that tin below the table?

A.—I have not seen the tin, but I have samples myself.

Q.—Will you look at that and stir it up?

A.—This has passed through the dredger?

Q.—It has?

A.—Of course that is more solid at the bottom. I went out in the "Mosquito" punt . . . . . .

Q.—You could not have any worse stuff than that?

A.—I have never seen anything else come through for reclamations.

Q.—You could not have anything wore than that, could you?

A.—Yes.

Q.—What could it be?

A.—The Melbourne silt is worse than that.

Q.—Has it any sand in it?

A.—It has particles of sand.

Q.—Then it could not be worse than that because sand is an improvement. There is practically no sand in that?

A.—I understand that the silt is impalpable sand; it is all washings down.

Q.—The water will run out of sand, but it will not run out of mud? Sand is granular but that is not?

A.—That is its first condition, of course. It would be in the form of clay.

Q.—I do not suppose there is one per cent. of granular matter in that?

A.—I have seen worse than that. The whole of West Melbourne swamp is made up of worse than that. I also know a suburb of Melbourne, a place called Elwood, lying between South St. Kilda and North Brighton, made of worse than that, and it has very fine palatial buildings erected on it.

Sir M. Visvesvaraya.—Is that due to salt efflorescence?

A.—Salt efflorescence?

Q.—Yes. Is the soil to which you refer impregnated with salts?

A.—Yes, it is sea water.

Q.—That must be the reason.

A.—They topped it and they drained it. In reclaiming they had weirs, and they drained off the water and allowed it to precipitate, and then after it had dried out in the hot Australian sun they topped it with hard material. I have seen much worse material than that.

Chairman.—Do you remember going up to Marine Lines with Mr. Brims to see what the "Kalu" was doing?

A.—Yes.

Q.—Did you notice for 800 or 900 feet along the face of the wall, and nearly the same distance out, that pumped material was escaping?

A.—Yes, I did.

Q.—Was not it evident to you that a very large percentage of the pumped material was escaping through what was an extremely porous wall?

A.—Naturally that is the case, and that is why I called attention to it. I could not understand the condition of the wall.

Q.—Exactly. One of the objects of the wall is to retain the material that is pumped into it?

A.—Yes. I should certainly blame the Resident Engineer for that. It shows that he did not know his job.

Q.—The Resident Engineer has to work to specification?

A.—He had the specification. Of course that brings in a very large question. One wants to go back and to inquire what was the arrangement at that quarry. Were they quarrying for small stone or were they quarrying for large stone.

Sir Frederick Hopkinson.—No amount of mixing will make a loose stone rubble mound watertight?

A.—I have seen it done.

Q.—Have you?

A.—I have; with core; with run of quarry core.

Q.—It is a miracle if you have.

Chairman.—We are much indebted to you for your statement, which we will incorporated in your evidence. Those are the only questions which appear to me to be material as far as I am concerned.

Sir M. Visvesvaraya.—In the last paragraph, on page 5 of your statement, you say : " It is my considered opinion that had even a portion of these works been designed and the usual contract plans and documents been prepared before inviting tenders, the canal would not now be in existence, for the time required to design the works and prepare the contract documents would have been so great that not only the public interest, but also the enthusiasm for, the scheme, which had been kept alive during the period 1882 to 1887, would not have survived." You say " the enthusiasm for the scheme which had been kept alive." Of course you do not lauch such schemes on a wave of enthusiasm, do you?

A.—I cannot conceive of the Manchester Ship Canal ever materialising without that enthusiasm. I passed through the whole of that period.

Q.—Again, in the very last page of your statement you have made some remarks about the horse-power of the dredgers. Have you made any comparisions and deduced that the horse-power in this case was sufficient to pump 2,000 cubic yards per hour?

A.—I have not really, although I have a specification here of two 2,000 tons dredgers for which Messrs. Lobnitz got the contract in 1916 for the Commonwealth of Australia. They give the boiler horse-power there.

Q.—You have not gone into the question of the horse-power?

A.—Except, of course, when I was in Bombay I just ran it out from a 44lb. pump pressure. I ought to say that in taking these tests I got readings. I got the Chief Engineer of the dredger to take readings of the revolutions and the pressure at the engine, and also the vacuum. The highest pressure at the pump was 44 lbs. That is practically equal to 70 feet head. As a matter of fact it is just over 70 feet head. 70 feet head would give you a velocity of clear water of 12 feet per second at the end of 5,000 feet of pipe line. No, I am wrong in that. 44 lbs. is equal to 100 feet lift. 70 feet head at the engine would give you a terminal velocity at the end of the 5,000 feet length of pipe line of 12 feet per second.

Q.—Have you provided for the horse-power for the cutter?

A.—I am dealing with the pump engine. They are detached. If you add 50 per cent. for friction head to the 70 feet it would give you, say, 105 feet head. Here 44 lbs. pressure at the engine gives you about 100 feet head. That satisfied me, at all events, as to the sufficiency of the horse-power.

Q.—The suction pipe?

A.—Yes.

Q.—What about the cutter?

A.—There is ample power.

Sir Frederick Hopkinson.—That is a separate engine?

A.—That is a separate engine.

Sir M. Visvesvaraya.—Have you seen that the horse-power is sufficient for that.

A.—Yes, more than sufficient. Of course, she has an automatic cut-off. When the cutter comes up against anything hard the steam is automatically cut off.

Q.—The allegation is that the cutter does not cut the hard clay fast enough?

A.—I was on board. Of course, I cannot speak as regards the East side of Oyster Rock, but I spent a very large amount of my time on the dredger during the time that she was cutting in what was considered to be hard material on the West side of Oyster Rock, and I never saw the cutter brought up once. She cut everything before her, except moorum, when she was brought up.

Q.—She may cut, but at what rate?

A.—Of course, I cannot say, because no tests were taken at the time that I was on board.

Q.—You have not got definite figures?

A.—No. Naturally, if you get into hard material your output will decrease.

Q.—If you get into stiff material such as clay?

A.—No, the moorum. There was no hard material there except the moorum.

Q.—We have been told that the clay has been giving all the trouble, and not the moorum. They do not go into moorum except, perhaps, by accident, and then they at once shift their position?

A.—All round the end of the pipe on every shift I saw that there were balls of clay. I measured many of them. They were 18 inches in diameter and downwards, and that was extremely soft material. If it had been in the sun for three hours you could jump on it from the top of the pipe without making an impression.

Sir Frederick Hopkinson.—In the table at the end of your statement you gave the discharges on Thursday, Friday, Monday, Wednesday, Friday, and Tuseday, with certain

percentages of solid material. There are nine totals. At that time was the dredger working well?

A.—I can only form an opinion from the statements that I got from the dredger.

Q.—Were you on board at the time?

A.—Not at the time when the tests were taken.

Q.—You were not on board at the time?

A.—No, I was at the end of the pipe line.

Q.—Had you anyone to tell you if the dredger was working well?

A.—Only these statements; that is what I got. I got the Chief Engineer of the dredger to take them every half-hour, and give me the readings.

Q.—Do you think that the dredger was then doing as well as she could?

A.—I would not like to say. It is not so much the dredger doing as well as she could, but was she being fed properly?

Q.—Quite. That is part of her doing as well as she could. If she is not fed she could not do well?

A.—One wants to differentiate between a dredger doing well as a tool and a dredger being handled as a tool.

Q.—We are not interested in a dredger doing well as a tool. We are interested in her turning out 2,000 cubic yards an hour?

A.—If you get a good tool, and it is handled badly, you cannot get your output.

Q.—I notice that the average discharge on your figures is 997 cubic yards per hour?

A.—Yes.

Q.—That is what we complain of.

A.—I wanted to know why we could not get 1,552 cubic yards every time. If you can get it once, why not always?

Q.—This was taken by the samples, was it not?

A.—Yes, at the discharge.

Q.—That is the same as you use if you are pumping sand, is it not? What size tube was it?

A.—It was a graduated glass for measuring the precipitation of the solids. The jet at the end of the pipe line was measured.

Q.—Of what diameter?

A.—1½ inches diameter.

Q. It is very useful if you are pumping sand?

A.—Yes.

Q.—It is entirely useless if you are pumping lumps of clay 18 inches in diameter?

A.—You cannot take the clay at all.

Q.—Therefore this is absolutely unreliable and useless?

A.—Not so far as material in suspension is concerned.

Q.—That is no good. You want the clay?

A.—You cannot get the clay. There are no practical means of getting it.

Q.—It is impossible to test it in that way. The only real test is by cross sectional measurements of the dredging done, is it not?

A.—And that only over a long time.

Q.—Not a very long time; a week, say?

A.—No, you cannot get it in a week.

Q.—A month?

A.—No, you cannot get it in a month.

Q.—Why not?

A.—Simply because you have got the settlement to take account of. How can you take the settlement?

Q.—There is no settlement at all. You measure the cross sectional area of the work done, not the reclamation work, but the dredging work done?

A.—Yes.

Q.—Is it not possible to measure up accurately each day or two exactly what material has been dredged?

A.—Hardly, under the conditions that are obtaining out there. For instance, we used to run up behind the dredger and trace out the lines by means of sinkered barrels or buoys, and then set our wires across, and know exactly what we were doing.

Q.—The head chain on your dredger is absolutely taut, is it not?

A.—Yes.

Q.—Cannot you measure on that every time you go ahead, and cannot you, from the ship's deck, take your soundings as close as you like of the work accomplished behind you?

A.—Then what about the settlement.

Q.—Never mind about the settlement. I do not care about it. There is no settlement. You have got the level of the surface of the mud or clay before you touch it, and you have got the level after you have dredged it?

A.—Yes. I think if you took soundings a short time after the dredger had passed over the area your lead would probably sink in 18 inches to 2 feet.

Q.—Why.

A.—Because that has always been my experience.

Q.—Why should it?

A.—You have dredged the mud away, even with bucket dredgers.

Q.—You have dredged the mud away?

A.—That has always been my experience.

Q.—That would give a more favourable result. It would show that you had dredged more than you actually had?

A.—Of course, you know as well as I do that soundings, under those circumstances, would have to be taken very carefully.

Q.—Quite. I am assuming, of course, that they are done properly?

A.—You do not want to drop the lead over by the bridge.

Q.—I am speaking of proper soundings?

A.—If systematic soundings are taken properly then you can arrive at it, and it is the way of arriving at it.

Q.—It is the only way, is it not?

A.—Yes.

Q.—The speed of the effluent, I gather, was about 10 to 11 feet per second?

A.—Yes.

Q.—That gives a maximum output on a 42 inch pipe of about 13,468 cubic yards per hour, does it not?

A.—Yes, I believe it was about that.

Q.—Your table shows that your discharge varied between 5.77 per cent and 16.01 per cent?

A.—Yes.

Q.—I suggest to you that anyone doing pump dredging work is doing quite good work if he is getting 10 per cent., is he not?

A.—Yes, 10 per cent to 12 per cent.

Q.—10 per cent?

A.—10 per cent. to 12 per cent.

Q.—10 per cent. on 13,468 cubic yards an hour is 1,346 cubic yards an hour of solids?

A.—Yes.

Q.—And that is the maximum that your dredger can do?

A.—No, I would not like to say that. 1,552 cubic yards is given in the statement attached to my report dated 30th December, 1925.

Q.—Those are your figures?

A.—Yes, so far as they go.

Q.—Those are your figures. Turning back to the page before that, you have some precipitation tests of the day and nights shifts. You show there that the percentage of the night shift was 68·66 per cent. of the day shift?

A.—Yes.

Q.—That is about what you would expect, is it not?

A.—I do not know. I think I should expect a little more.

Q.—You would expect a little more?

A.—About 75 per cent.

Q.—You would expect about 75 per cent?

A.—Yes, properly worked.

Mr. Billimoria.—I have nothing to ask you.

Chairman.—We are much obliged to you, Mr. Settle.

(*The Witness withdrew.*)

(*Adjourned to to-morrow at* 11 *o'clock.*)

The Committee assembled at 11 a.m. on the 4th November, 1926, all members being present.

Sir H. Courthope-Munroe.—I regret keeping the Committee waiting a few moments Sir, but I have just heard from my client, Sir George Buchanan—or rather from his family—that he is seriously ill in bed. Under those conditions, it is impossible for him to attend. I need hardly say that he is most anxious that he should attend before this Committee, because there are a good many matters, which have not yet been dealt with in London, which were dealt with in Bombay at the time—when he had no opportunity of dealing with them, and which, in his own interests, he is most anxious to deal with before this Committee. Two questions remain. One is whether I should address you, as you have been good enough to permit me to do, on the construction of the agreement. I cannot help thinking that that is a matter which had better be dealt with at the close of the enquiry rather than in the course of it.

Chairman.—When you have the whole of the material before you and the result of your re-examination?

Sir H. Courthope-Munroe.—Quite. That is a very material matter, and one, I think, which must be dealt with at the close of the enquiry. The second question is this: I think it is essential that Sir George should be here to deal with those matters which are referred to in the shorthand notes, and the only point is when he will be sufficiently recovered to deal with them. I shall be seeing his doctor to-day, and I will ascertain what he thinks will be the earliest time at which Sir George can attend. I need hardly say that he is most anxious to attend, because, apart from what has taken place in London, there are numerous matters in Bombay which must be cleared up.

Chairman.—It would be a matter of great regret if Sir George left the examination in this truncated form. It is very important that he should be re-examined by you—most important. The Committee regret very much to hear that Sir George is ill, and we will meet his convenience in every possible way. I suggest, Sir Harry, that if Sir George's solicitors will give Mr. Ewbank 24 hours' notice we will attend here on any day next week it will suit Sir George's convenience. There will be a few more questions which Sir Frederick Hopkinson wishes to put, and a few questions which Mr. Billimoria wishes to put, and your re-examination, and then your view of the construction of the agreement. That can all be done within a day?

Sir H. Courthope-Munroe.—I think so.

Chairman.—Quite easily. We must arrange that it is done within a day; we cannot give any more time.

Sir H. Courthope-Munroe.—That is what I should myself wish.

Chairman.—Will you convey to Sir George Buchanan the real regret of the Committee at his having broken down. I think you might say that we noticed that he was under very severe strain on Monday and Tuesday.

Sir H. Courthope-Munroe.—That is why you were good enough to give him a day's rest?

Chairman.—Yes. Indeed, we noticed on Tuesday that he was under an increasing strain, and in our view that made it very desirable that Mr. Halcrow and Mr. Settle should be interposed. Now, Sir Harry, we had better leave it like that, I think?

Sir H. Courthope-Munroe.—If you please, Sir. I will convey your remarks to Sir George.

Chairman.—Your solicitors will give Mr. Ewbank 24 hours' notice—if they can give more, so much the better—of Sir George Buchanan's intention to attend; and I do suggest that, even if he attends under very considerable difficulty, he should nevertheless attend, because it is very important. His evidence is being no doubt regarded with great care in Bombay, and they will wish to have the whole story from him. We wish also to have such help from him as we can get, and also help from you in the re-examination.

Sir H. Courthope-Munroe.—If you please, Sir. I am obliged to the Committee.

Chairman.—Then the Committee adjourns until we hear from your solicitors as to the day on which Sir George will attend?

Sir H. Courthope-Munroe.—If you please, Sir. At the last meeting Sir George promised to give some information with reference to one of the pipe-lines for which you asked. He has put it on paper, and I will hand it in. (The document was handed in.)

(The Committee then adjourned *sine die*.)

The Committee assembled at 11 a.m. on the 12th November, 1926, all members being present.

The examination of Sir George Buchanan was continued.

Sir H. Courthope-Munroe.—Before you start the proceedings, Sir, may I call your attention to the fact that there is a clerical error in the shorthand notes on Thursday, October 28th, and as these are matters of record it had better be put right. It is on the last page, page 103, in the last observation that you made. After Sir George Buchanan had made that little sketch, giving the three divisions, you said, " This No. 3 is stiff unctuous clay. The other is the clay from No. 3 on the sketch of Sir George Buchanan ". That should be No. 2.

Chairman.—I have already crossed out " No. 3 ". That is obviously wrong. It should be " No. 2 ".

Sir H. Courthope-Munroe.—It is on record as No. 3, and, in years to come, it might be said, " What is the meaning of this? " It should be No. 2.

Chairman.—It will be corrected in the final proof. It is No. 2. This is clay from No. 2. Thank you, very much.

Sir Frederick Hopkinson.—(to the Witness) Simons' original quotation for the dredger was dated September 12th, 1919, I think.

Chairman.—Page 29 of your report, Sir George?

A.—Yes.

Sir Frederick Hopkinson.—You recommended the Bombay Government to place an order with Simons on February 26th, 1920, I think?

A.—Yes.

Q.—In your note of the same date you say, " No. 1 declined to tender ". That is Ferguson Brothers. " No. 2 wished for a great deal of information not available ". That is Fleming & Ferguson. Is that so?

A.—I have not got the papers by me, and I cannot tell you.

Sir H. Courthope-Munroe.—What page are you on?

Witness.—I do not know; I have not got the papers.

Chairman.—I suppose you will assume that that is so?

A.—I will assume that that is so.

Chairman.—It shall be handed to you afterwards.

Sir Frederick Hopkinson.—It is an extract from a letter of Mr. Mackie. You say that information was not available. The information they asked for is contained in their letter of the 22nd January, 1920, and the points are these: they wanted to know, first, the average working output; second, the length of pipeline; third, head against the pump; fourth, revolutions and diameter of pump impeller; fifth, velocity of material through piping. That was all essential information, was it not?

A.—We did not give that information, no.

Chairman.—The question is, " That was all essential information? That is the only question for the moment.

A.—They wanted to know that information, yes.

Q.—" Essential information "; that is the only question for the moment?

A.—Yes.

Sir Frederick Hopkinson.—They could not possibly give you a tender for the dredging plant without that information, could they?

A.—They would have to get it themselves.

Q.—No, no. They wanted to know how much an hour you wanted pumping. They could not tell. It must come from you, and, as a matter of fact, that is the information you gave the other tenderers.

A.—We gave the same to all tenderers. I cannot remember all these details now, because I was in Bombay.

Q.—Just follow it through with me. They were asking for information on the 22nd January—essential information which they had not got in their possession; and until they got that information they could not possibly quote, could they?

A.—I suppose not, no.

Q.—That information had been given to other tenderers. I want to ask you now whether you can explain why that information was not given to Fleming & Ferguson?

A.—I have not the faintest idea. I was not here at the time. I was in Bombay. It was conducted by Mr. Meik.

Q.—The fact appears to be that three of the tenderers were given information and that it was withheld from Fleming & Ferguson. Messrs. Lobnitz were given certain

information. The information which Messrs. Meik & Buchanan gave to Lobnitz was as follows. You sent to Messrs. Lobnitz: "Particulars, 2,000 cube yards an hour; discharge from dredger 5,000 feet; maximum length of discharge pipe 14,000 feet." Then depth, and so on, is all the same. "Character of material, soft clay."

A.—Yes.

Q.—Can you tell me why you gave them the maximum length of discharge pipe as 14,000 feet, whereas in fact Messrs. Simons' tender of September only provided for 8,500 feet?

A.—I think you are mistaken. It is 14,000 feet altogether.

Q.—No—"maximum length of discharge pipe 14,000 feet."

A.—14,000 feet from the dredger.

Q.—No. "Discharge from dredger 5,000 feet; maximum length of discharge pipe 14,000 feet," and on that information Messrs Lobnitz quoted for 19,000 feet of pipe, whereas Simons had only quoted for 13,500 feet. So there is a difference of 5,500 feet of pipe between the two. On the same note of 26th February, you say: "With regard to No. 3 tender, I have no details of Lobnitz's tender, nor is any time for delivery given; but I do not in any case see the necessity for two dredgers, and I recommend that Simons' tender be accepted"?

A.—Yes.

Q.—At that time did you know the amount of Simons' tender?

A.—Yes, certainly.

Q.—What was it?

A.—£451,000.

Q.—That was September. The Lobnitz tender is February?

A.—Yes, and Simons' firm offer terminated in March, I think.

Q.—Their firm offer was September. It was subsequently extended for three months on an additional allowance of 10 per cent.?

A.—Yes.

Q.—Therefore the price would not be £458,000? It would be 10 per cent. on top of that, would it not?

A.—Well, take it so.

Q.—That would only take you up to December. As you know, and as we all know, prices then were bounding upwards?

A.—They were, yes.

Q.—My suggestion to you is that on 26th February, 1920, when you recommended the acceptance of Simons' tender, you did not know the amount of their tender, nor did you know what Lobnitz were offering? As a matter of fact, Lobnitz were offering a totally different machine, or set of machines, from those quoted by Simons. Lobnitz's tender was for two dredgers capable of pumping 19,000 feet, each of the dredgers being capable of forcing 8,000 feet—19,500 feet in all. Therefore I want to see on what ground you recommended the Bombay Government to accept Simons' tender, which was totally different from Lobnitz's, and which you did not know how much it was?

A.—I would not like to say I did not know how much it was. In September they quoted that, and there was a three months' extension.

Q.—Not in September?

A.—The firm offer lasted until March.

Sir Frederick Hopkinson.—Can you refer me to that document?

Chairman.—I am looking for that. Would you turn to page 18 of your report? It says: "If ordered within three months from this date we will have the dredger ready for trials on the Clyde". That might be construed as being an offer to remain in existence for three months. Is there any other passage there with regard to the extension of that up to March?

A.—I feel quite certain it was extended up to March.

Q.—I think you are right about that, but when it was, and how it was, we do not know. As I say, I think you are right about that, because there is a letter of yours in which you mention the fact that there had been an extension to March, but whether there was on this date to which Sir Frederick Hopkinson is referring, is a matter which at present is not clear.

A.—I feel confident that at that time the firm offer went on to March, because naturally we wanted to take advantage of a firm offer of that description.

Sir Frederick Hopkinson.—But was not that subsequently altered by a letter in which they said they would require 10 per cent. extra?

A.—Yes, but even 10 per cent. extra at that time would have been a great bargain. Here is a letter. This all took place when I was in India. The three months was up in December. We wrote in London and asked them if they would keep the tender open.

We knew it was a favourable tender, and they said that they would keep it open for three months for 10 per cent. That is the 11th December. It was March.

Q.—How did you know it was a favourable tender?

A.—Well, we have a modicum of common sense, and Mr. Meik looked into it very carefully, and I still say it was a very favourable tender.

Q.—Had you any competitive prices?

A.—We had Lobnitz's.

Q.—No, no. This is before Lobnitz's case is seen at all. You say it was a favourable price in September, I am asking you the authority for that—any time from September to December?

A.—This was an estimate. Before we accepted this estimate we took in tenders.

Q.—No, no. That is not my question at all. You said just now that you knew it was a favourable price. I want to ask you why you considered it a favourable price?

A.—We knew it was a favourable price when we recommended——

Q.—No, no; that is going into next year. I am speaking of some time between September and December. How did you know it was a favourable price without competitive quotations?

A.—When did we recommend that it should be accepted?

Q.—February; but I am going on the statement you made just now. You said that before December you knew it was a favourable tender?

A.—I did not say that.

Q.—Yes, you did.

A.—Well, look here, let us get it plain. We took in this estimate as an ordinary estimate. We took an estimate from Simons for a dredger in the ordinary way in which engineers do every day of their lives. It was not binding; it was not an acceptance. It was an ordinary estimate. Before we recommended this tender for acceptance we took in prices from other dredger builders. When we had got the prices from the other dredger builders, Mr. Meik, who is now dead, cabled me out his opinion and the results. He did the whole of the work in taking out the tenders, and when we had got the tenders it was then that we recommended Simons. We did not recommend the acceptance of Simons's tender before.

Q.—Can you give us a copy of that cable which Mr. Meik sent out to you?

A.—I do not know.

Q.—Because it does not appear in any of the documents we have got. According to Mr. Mackie this is a note made by you on the 26th February, "No. 1 declined to tender." That is Ferguson Brothers?

A.—Yes.

Q.—"No. 2 wished for a great deal of information which was not available." I say that that was absolutely essential information and was given to the other tenderers. "I received a cable yesterday from my firm about No. 3"—that is Lobnitz—as follows: "Lobnitz tender of £840,000 for two complete dredgers each of 2,000 cubic yards capacity and pipeline, one dredger being used for intermediate station." Is that the whole of the information which you had from your office in London?

A.—If that is the cable, yes, I suppose it is.

Q.—There is nothing there about telling you what Lobnitz had quoted for, except that they quoted for two dredgers?

A.—Yes.

Q.—Before we go away from that I want an answer to my earlier question. You said just now that in December you knew Simons's was a favourable tender. I want to know how you arrived at that?

A.—I take that back. I say that we did nothing until we had taken in tenders.

Q.—Then that is withdrawn. The point is this——

A.—I see the point.

Q.— —that the tender of Simons's of 1919 was about four times the price of the "Kalu," and one is very nearly as big as the other.

A.—I am perfectly aware of that. Later on the matter was taken out of my hands. It went to the India Office. I actually did not know what price had been arranged for the dredger until it was all settled, and then the India Office wrote me a note saying, "We have arranged this and that and the other."

Q.—You could have no possible idea of what the dredger was going to cost? Surely the India Office and the Director-General of Stores would not accept a quotation for dredgers costing three quarters of a million without consulting you, would they?

A.—Yes, they did.

Q.—Another wonderful method of doing business, is it not? There is a letter from Messrs. Meik & Buchanan saying they cannot answer Fleming & Ferguson's question

about the quantity of material to be dredged, but they are sending a copy to you in India. Can you give me any idea why they could not answer that question, seeing that they had told the other people?

A.—I absolutely cannot tell you at this time.

Q.—It seems an extraordinary thing.

A.—It took place in 1919, and it was all done by Mr. Meik. If we could resuscitate Mr. Meik from the grave we could get a lot of information.

Q.—I suggest to you it is an extraordinary letter to write—that they could not tell Fleming & Ferguson what the dredger was expected to do on 23rd January, 1920. Now apparently the only information you had in Bombay on 26th February, 1920, was that cable from your firm in London?

A.—Yes.

Q.—They did not tell you there that Lobnitz's dredgers were 3,750 h.p. each, did they?

A.—No.

Q.—They did not tell you that Lobnitz's price included 19,000 feet of pipe? They did not tell you that Lobnitz's provided for double stage pumps, two engines on each boat, and that their pumps would deliver to 8,000 feet. They did not tell you any of that information?

A.—They did not tell me any of that. There was a memorandum made by Mr. Meik which came out at a later date.

Q.—That was after it was settled?

A.—Yes. I suppose it was after it was settled, but I still think that if we could have got Simons's tender accepted before the end of March it was an extraordinarily good offer indeed. If their tender had been accepted, even with it carried on for three months, they would probably have lost a great deal of money.

Q.—Actually their price was about £260,000, was it not, and of that they returned part to the Bombay Government, so there is very little difference between that and their price of September?

A.—There is a good deal of difference.

Q.—Their price in September was £249,000, and the cost price was £268,000, I think. That is about 10 per cent.?

A.—It is £182,000.

Q.—What, the dredger?

A.—The price in September for the dredger was £182,000—page 17.

Q.—£182,000 plus £17,000; that is £200,000?

A.—If I may say so, these questions about the increase in price of the dredger might very well have been addressed to Sir John Biles.

Q.—He had nothing to do with placing the order, with advising the Government of Bombay to accept the tender?

A.—I am talking of a later date when the firm offer of Simons had run out. When the time had run out, and we could not get the plant for that amount, it was then put into the hands of the India Office and Sir John Biles, and I take it that Sir John Biles had certainly been consulted about the price.

Sir Frederick Hopkinson.—We have no evidence that he was.

Chairman.—He has not said anything about that.

Sir M. Visvesvaraya.—He referred us to Sir George Buchanan.

Sir Frederick Hopkinson.—Before recommending the rejection of Lobnitz's tender in February, 1920, why did not you ask Simons what their price was in February, because, as you state, and as all we know, prices were bounding up at that time?

A.—We had got in prices in February.

Q.— No; you had only their price five months earlier?

A.—Yes, and we got their price in February. Their time did not run out till March.

Q.—Yes, their time ran out on December 11th?

A.—No, we got the extension.

Q.—Yes, for three months. We have no reference to that.

A.—I have just given the Chairman a letter.

Q.—That is to December?

A.—That is to March.

Chairman.—The letter is the 11th December, signed by Mr. MacMurray and extending the three months' time limit on an increase of 10 per cent.

A.—To March.

Q.—So that on an increase of 10 per cent. there was the option up to March, 1920?

A.—That was it, yes.

Sir Frederick Hopkinson.—Had you gone into the figures at all carefully you would have found that Lobnitz's tender was an actually cheaper tender per horse power than Simons' tender. Including the two dredgers and the 19,000 feet of pipe Lobnitz's price was £112 per horse power. Simons' price, as paid, and including 18,000 feet of pipe-line was £129 per horse power. If you take the dredgers alone without the pipe-line, Simons' price was £88 10s. 0d. per horse power, whereas Lobnitz's was £83 10s. 0d. per horse power with an effective radius of 8,000 feet, and had those two dredgers been there it looks as if none of this trouble would have arisen?

A.—Well, I have not got the figures.

Q.—I have worked them out from the actual prices paid and the estimates given?

A.—Very well. All I have to say is that in perfect good faith we recommended Messrs. Simons' tender.

Q.—I am not suggesting anything against your good faith?

A.—I see I have a note here " I have never seen the contract for dredger "—that is the " Sir George Lloyd "—" and I do not think I knew the total cost plus freights until long after the dredger had arrived at Bombay, and then I had to ask specially for information."

Sir Frederick Hopkinson.—I suggest you ought to have known that—that you could not properly fulfil you duties until you did have that information. How could you supervise it if you did not know what the dredgers were going to cost?

Chairman.—You say that Sir John Biles, as the consulting naval architect, made the final financial arrangements?

Sir Frederick Hopkinson.—No, I think not. I think Sir John Biles had nothing whatever to do with it.

Chairman.—That is what Sir George states.

Witness.—I only make the suggestion. I do not say it was the fact.

Sir Frederick Hopkinson.—We have no evidence that he had anything whatever to do with the financial arrangements.

Chairman.— At all events, Sir George, let us get it right. You say that you did not finally settle, on behalf of the Bombay Government, the price that should be paid for the dredger?

A.—Certainly not.

Q.—Then leave it at that. Never mind who else did it; you did not do it?

A.—I did not do it.

Q.—Nor your firm.

A.—Nor my firm.

Chairman.—Then leave it in that way.

Sir Frederick Hopkinson.—While I am on the question of dredging, there are one or two things I would like to clear up. We have been told that you had weekly reports of the dredging done and the position of the dredgers. Is that true?

A.—Yes, there were weekly reports.

Q.—And the chief engineer, Mr. Elgee, has stated that the scale of bonus which was laid down by you personally made no marked difference in the output?

A.—My recollection is that they did not give the bonus on the lines that we recommended.

Q.—That is Mr. Elgee's statement?

A.—We have no record, but there is correspondence on the subject of the bonus. They proposed a bonus in a certain way, and we protested. We said, " That is not the way to arrange the bonus."

Q.—With regard to the dredger trials, did you attend them?

A.—I did not.

Q.—Did you have your representative there?

A.—Mr. Meik was there personally.

Q.—Did you ever examine the results?

A.—I must have examined them. I did not examine them critically I suppose. After all, Sir John Biles was there, and Mr. Meik.

Q.—Of course the tests were not carried out under anything approaching working conditions, and they have been described as valueless. They gave a percentage of 39 to 41, solid matter, which, as we all know, is absurd, is it not?

A.—I was not present, as I say.

Q.—Your firm were represented there, and you accepted the dredgers, of course in conjunction with Sir John Biles, because, after all, your firm and Sir John Biles were in double harness in the matter. You accepted them?

A.—Sir John Biles was the naval architect and naturally was skilled in these matters.

Q.—But you had equal responsibilitites?

A.—I do not say equal responsibilities. Sir John Biles was the naval architect. We are not naval architects.

Q.—I suggest, further, that Sir John Biles had very little to do with the design of the dredger—that the dredger was designed before September, 1919, in all essential particulars. He may have made slight alterations, but the dredger was designed before you got the price of September, 1919; and it is really Simons' design. It is almost a copy of the "Kalu." The framing is identical. There is really very little designing about it by anybody— that is, original designing?

A.—Well, Sir John Biles might be asked about that.

Q.—You have recognised and your firm have recognised and it has been spoken of over and over again throughout the documents that the dredging is the absolute crux of the whole scheme?

A.—Yes.

Q.—That is so, is it not?

A.—That is so.

Q.—I want to ask you whether you did not think it personally encumbent upon you to be absolutely sure that the trials were certain to ensure success, and that they should have been carried out in the same conditions as they would have to work under in Bombay, including material?

A.—I was quite satisfied with the trials as carried out by Sir John Biles and Mr. Meik.

Q.—But the material in which the dredger was tried is nothing like the Bombay material. It was only passed through the ship, and not delivered 5,000 feet. Those conditions could have been reproduced on the Clyde had it been decided to do so.

A.—We are still going on the assumption that the dredger cannot do the work?

Q.—We are going on the assumption that the dredger never has done the work. It has had three years to prove it.

A.—Then we are going round the old circle that it has not done the work because of the human element.

Q.—I am coming back to my old view, namely, that as you had arranged for the dredger to do 2,000 yards an hour you ought to have stayed on that dredger until you had proved absolutely that it could, or could not, do it.

A.—And I say I am not a dredger master and I have never had any experience in handling dredgers.

Q.—But you are responsible for it?

A.—I am not a dredger master.

Sir Frederick Hopkinson.—But you are responsible for the work of the dredger.

Chairman.—I suppose you would say, Sir George Buchanan, that it having been agreed that there was to be a Clyde test, that the test was carried out on the Clyde with the known material at the bottom of the Clyde, whatever it was, and that it was carried out in accordance with the usual practice?

A.—Yes.

Q.—It may not be a good practice, or it may be a good practice, but the contract being for a Clyde test, the way in which you would put it I suppose is that the test was made in accordance with the ordinary conditions prevailing on the Clyde?

Sir Frederick Hopkinson.—Yes, so far as material is concerned, but not so far as length of delivery is concerned.

Chairman.—Then we get into the other point—whether when you are talking about a Clyde test, in practice they ever put 5,000 feet of pipeline on the Clyde on to the dredger?

A.—No.

Sir Frederick Hopkinson.—But the conditions can be reproduced in another way.

A.—I have had experience in dredging propositions, although I am not a dredging master, and I have been collecting some figures of cost of dredging, which I should like to have an opportunity of putting before you.

Chairman.—You certainly shall have that opportunity. Would you like to do it now?

Sir Frederick Hopkinson.—That is not quite finishing the point. The point is that the ordinary working conditions were not complied with at the trials on the Clyde. It did not pump to any distance at all, and therefore any result they got was valueless.

A.—Well, as the Chairman has said, it was done in accordance with the usage on the Clyde.

Q.—No, no. The usage, so far as the material is concerned, but not so far as the distance is concerned. If you specify for a dredger to deliver 5,000 feet it is a totally different machine from one to deliver into a hopper barge?

A.—Yes.

Q.—The conditions are entirely different.

A.—You could not put 5,000 feet of pipeline out in the Clyde.

Q.—You could put a vertical pipe and reproduce the condition, or you could have put out the 5,000 feet. There is plenty of room on the Clyde?

A.—This is not the only pipeline dredger that has ever been built, and in regard to the numerous dredgers which are built on the Clyde, I take it that the same tests prevail.

Q.—But do not you see that a dredger to deliver into a hopper barge is a totally different machine from one to deliver 5,000 feet, and the tests of the two boats would be entirely different?

A.—Yes. May I respectfully suggest that these questions might appropriately have been put to Mr. MacMurray? I do not know whether they were or not.

Sir Frederick Hopkinson.—We put plenty of questions to him.

Chairman.—This point was put to him, and Mr. MacMurray said it would not have been practicable to have put 5,000 feet of pipe-line on the Clyde, and it was not done.

Witness.—And Sir John Biles?

Chairman.—Sir John Biles's evidence undoubtedly suggests that this trial was carried out in the ordinary way in which trials are carried out on the Clyde.

Sir Frederick Hopkinson.—I want you to realise the difference. A dredger may be designed to pump into a boat alongside, and therefore has not got the extra power required to force it 5,000 feet in a pipe. Therefore it is a totally different thing.

Chairman.—I am only on the difficulty of a contract which specifies trials on the Clyde. Once you have bound yourself to a trial on the Clyde——

Sir Frederick Hopkinson.—You are bound to that material.

Chairman.—You are certainly bound to the Clyde material.

Witness.—Yes, and further I think you are bound, if there is anything like general usage, to have your trial in accordance with that usage.

Sir Frederick Hopkinson.—No. If you specify that it is to deliver 5,000 feet, you cannot say it has fulfilled its trial until it has delivered 5,000 feet.

Chairman.—Or the equivalent as calculated in trials on the Clyde?

Sir Frederick Hopkinson.—That is right.

Chairman.—You and I are not disagreeing on these matters but it is a little out of Sir George Buchanan's range.

Witness.—This is not the first suction pipeline dredger that Simons have built. They have built dozens of dredgers. Either they know their business or they do not.

Sir Frederick Hopkinson.—Was it not their business to get it passed? Was not that their principal business at this time?

A.—No.

Q.—I should say that they did understand their business well?

A.—I do not agree with you because a firm of Simons' standing obviously would not be so short-sighted as to want to get a bad tool passed.

Q.—Well, I would rather not go into that. The fact is that they got it passed without a test of pumping 5,000 feet. Now, in your original report you spoke of having a pontoon for the second station?

A.—Yes.

Q.—Why was that changed to the " Colaba "?

A.—It was changed to the " Colaba " because the electrical people in Bombay, after telling us that we could have electrical power, said we could not, as far as I remember.

Q.—But could not you put a steam plant on a pontoon equally well?

A.—Could we not have put a steam plant on a pontoon?

Chairman.—That is the question.

Sir Frederick Hopkinson.—There is no difficulty about it, is there?

A.—I canont remember now all the points, but I do remember that the intermediate stage dredger was gone into very carefully by Sir John Biles. I think I have got a letter somewhere to that effect.

Q.—The point I want to get at is why did you have a sea-going ship with twin screw propelling engines for your second ship, when all she had to do was to take up her

station on the first day of the season and go back into dock at the end of the season? I suggest it was an unnecessary extravagance?

A.—Well, I should like you to have asked Sir John Biles about that.

Q.—We did?

A.—What did he say?

Q.—You had better read it up in the evidence. I am asking you because I take it that you were chief engineer to the whole scheme, and that nothing of that kind would have been done without consulting you?

A.—As far as I remember I was not consulted at all on that point. As I say the thing was taken over by the India Office. I was consulted on certain special points. They asked me about the details, but I did not give a specific opinion about this, as far as I can remember.

Q.—Can you enlighten us at all about the reason for the great vibration on the " Colaba "?

A.—No. I confess that that is not a matter on which I can give you any information at all. Even Sir John Biles, who is, I suppose, one of the greatest naval architects, said a great deal about it, but I am not a naval architect and I cannot tell you anything about the vibration.

Q.—On the other hand, there is nothing new in a dredger of this kind. There must have been dozens of them built before I should say?

A.—I think Sir John Biles said it had something to do with the working out there. Did you examine Sir John Biles on the subject?

Chairman.—Yes.

Sir Frederick Hopkinson.—But the working out there is simply starting the engine. I do not see how it can be possibly put on the people out there?

A.—At all events, I am sorry. I do not know anything about the vibration.

Chairman.—Sir John Biles seemed to think it was the unevenness of the load, but unevenness of load must happen on every occasion when you are pumping. The question really is whether the " Colaba " was sufficiently structurally stiff.

Sir Frederick Hopkinson.—And moreover whether, if the " Colaba " had been properly tried in this country under the conditions prevailing in Bombay, its structural weakness would not have been found out at the trials; but as far as I can see the trials of the " Colaba " were even more perfunctory than those of the " Sir George Lloyd."

Witness.—Well, I was not present at the trials either of the " Colaba " or the " Sir George Lloyd " and, as I say, I believe there were a number of different opinions about the vibration.

Q.—Whilst on the subject of dredging, can you tell me who decided to send out the dredging crews—who decided that question?

A.—So far as I can remember it was decided in Bombay.

Q.—No, who decided in this country to send them out—who selected the men?

A.—The High Commissioner.

Q.—Advised by you?

A.—With the Board.

Q.—Therefore you would know every man who was sent out to Bombay?

A.—I would not know him personally.

Q.—You would know of every man who was sent out to take charge to work the dredgers?

A.—Certainly, I think we should.

Q.—Consequently you would know as to whether a single or a double or a treble crew had been sent out?

A.—Yes.

Q.—For working single, double or treble shifts?

A.—Yes.

Sir Frederick Hopkinson.—Therefore you would be fully advised in London as to how it was proposed and intended to work the dredgers?

Sir H. Courthope-Munroe.—Do you accept that statement, Sir George?

A.—I accept the statement that we advised.

Chairman.—No, no—that you would know whether one crew or two crews or three crews were being engaged. That is the only question?

A.—I suppose yes, we should know.

Chairman.—The answer to that must be yes.

A.—I do not know that the answer to that question must be yes, because there were a number of men who were engaged in Bombay.

Sir Frederick Hopkinson.—Not dredging masters?
A.—Not dredging masters.

Q.—The subordinates, but not the dredging masters?
A.—Not the actual dredging masters.

Q.—Or the chief engineers?
A.—Or the chief engineers.

Q.—Coming back to another subject, namely, the dredging programme, I have read through all the programmes, and I want to ask you if you can explain some things which appear to me to be very extraordinary. For instance, the first programme of dredging was made on April 25th, 1921, in a letter from you or your firm to Bombay. That is in document 11, page 5. Have you got that?
A.—No, I have not got it.

Chairman.—Let me give you my copy (handing same to witness).

Sir H. Courthope-Munroe.—What document is that, Sir?

Chairman.—It is the big volume of correspondence.

Sir Frederick Hopkinson.—I want you carefully to note the date. It is 25th April, 1921, which was before the dredgers arrived in Bombay?
A.—Yes.

Q.—The programme had apparently been considered, and this was sent out in advance of the dredgers. It says: "In December, 1922, or January, 1923, the 'Sir George Lloyd' alone was to fill up section 1 through pipe-line No. 1, 715,000 cube yards, or one month's dredging. The 'Colaba' therefore was not required"

Chairman.—You might point out that section 1, which has been referred to, is now known as Block 8.

Sir Frederick Hopkinson.—Yes, the small portion at the southern end. Then it jumps to October, 1923—"The dredger to work in area C through pipe-line No. 2 from Arthur Basin, as the length to Marine Lines is very long." That is, it had 10,000 feet of delivery pipe on the harbour side. Then it goes on to say that the "Sir George Lloyd," the "Colaba," and the "Kalu" were to work together. That is presumably on the harbour side?
A.—Yes.

Q.—Can you tell me how that was to be done, and why you wanted three on the harbour side when the distance was only about 5,000 feet, and you had 10,000 feet on the other side?
A.—Really, Sir Frederick, I cannot go into this. This is a suggested programme made in 1921.

Q.—But I want to see why the "Kalu" is introduced into this, because there was no more to be done at this time than was originally contemplated?
A.—Well, I cannot answer these questions. This is a proposed programme of operations, subject to discussion. There it is.

Q.—But this is a programme given by you, the Chief Engineer of the works, to be carried out. I want to know why you want three dredgers on the harbour side?
A.—"The following is the proposed programme of operations."

Q.—You suggest that the "Kalu" should begin work in October, 1923, but actually she was not fit to work until July, 1924?
A.—No, for a very excellent reason.

Q.—That she had not been repaired?
A.—That she had not been repaired.

Q.—Did not you know this when you made this programme of April, 1921?
A.—That the "Kalu" had not been repaired?

Q.—Yes?
A.—I take it that I supposed that the "Kalu" would be in working order by that time. I had nothing to do with the repairs of the "Kalu."

Q.—Did not you do anything to make sure that she would be in working order at the time?
A.—I had nothing to do with the "Kalu." I do not even know what the repairs cost. I had no hand in the surveys. There is a letter on record, I remember, in which I wrote to the Director of Development impressing upon him to speed up with any repairs necessary to the "Kalu."

Q.—I think that was towards the end of 1923. I am speaking of a programme made in April, 1921. You are sending out a programme for a machine to work which could not possibly work?

A.—I do not see why I should assume that the " Kalu " required all these repairs. We sent out, to the best of our ability, a programme of operations for consideration. As a matter of fact, that programme was not carried out at all. We sent out programmes, but we had no power to carry out those programmes. We sent out suggestions. We were full of suggestions, but we had no power to tell the Chief Engineer to hurry up with the repairs to the " Kalu," or to do this, or to do that.

Q.—My suggestion is that it was never necessary or desirable to put three dredgers working in series on the harbour side? There was no room for them to work. They could not work there.

A.—I should not like to agree or disagree with you without consideration. As I say, it is a very long time ago. As a matter of fact, this programme was not carried out.

Sir Frederick Hopkinson.—I am afraid that applies to practically all the programmes.

Chairman.—Can you, even now, looking at the map in front of you, suggest how those three could have been worked conveniently and economically together? Does it occur to you now how it could be done? We have all the plans and everything here?

A.—I could not say off-hand, Mr. Chairman, but if I went to my office I could produce a plan showing the three working. As a matter of fact, it never materialised.

Sir Frederick Hopkinson.—There was no alteration between then, 1921 and 1919. The work remained the same, and in 1919 the work was to be done by two boats. It is only more or less of an accident that you have the " Kalu " there. She is not a part of your operations for completing the work in six years?

A.—No.

Q.—Then it goes on to say that you hope to finish section 2 in one season—5,700,000 cubic yards. Of course, we know she never did more than one-fifth of that.

A.—Well, it was a very good thing to be optimistic, and to express a hope.

Q.—You think it was?

A.—I do.

Q.—Then in October, 1924, there is another programme, area No. 3, to be begun. Area No. 3 is the Marine Lines end. That was to be begun from H.J. and K.—that is here? (*indicating on map.*)

A.—Yes.

Q.—We know it was physically impossible to do that?

A.—You see, all these programmes were altered when the Development Directorate discovered, as they thought they had, the material in Back Bay itself.

Q.—But this is October, 1924?

A.—Yes, October, 1924. This is the suggested programme made in 1921.

Q.—No, this is a new programme made in October, 1924.

A.—I have not got that. What page is that?

Q.—It follows on in that book.

A.—Yes, it is all under the same letter of the 25th April, 1921.

Sir Frederick Hopkinson.—No, this is October, 1924.

Chairman.—Will you turn back to page 5. It is a forecast looking ahead from 1921 onwards?

A.—Yes. In 1921 one makes a suggested programme for five years' work, but in a work of this magnitude questions arise every few months. You must have something to start upon.

Sir Frederick Hopkinson.—There, again, your optimism is just as strong as ever. You are going to do 6,387,000 in one season of 1924-25 and a portion of 1925-26?

A.—Yes.

Q.—Section 4 was 3,500 feet away from the end of the pipe. Then we come to the programme of 3rd May, 1923, in which the " Kalu " and the " Colaba " are to be working together in Back Bay?

A.—Yes.

Q.—And the " Sir George Lloyd " alone in the harbour?

A.—Yes.

Q.—Was anything done to prepare for the " Colaba " working in Back Bay?

A.—Which page is that?

Q.—That is 3rd May, 1923, page 84. The third paragraph in the letter says: " With regard to the general dredging programme, we have prepared a scheme on the assumption that an effort will be made to put both dredgers in commission after the coming south-west monsoon." That would be December, 1923?

A.—Yes.

Q.—They were only to make an effort to get them ready?

A.—Well, if you ask people to make an effort——

Q.—This is on the assumption that an effort will be made. Where was the "Colaba" to work, and how was she to work, because so far we have only had a reference to a hole being dug to float the "Kalu"? Will you turn to page 100. This is the 3rd November, 1923. You write to the Director of Development and you say in the first paragraph: "It appears to us that it will assist the administration to have before them even a tentative programme of operations".

A.—Yes.

Q.—So that, as far as we have got at that time, it is a tentative programme?

A.—Yes.

Q.—On page 101 you say that it will be possible to complete the dredging in the year 1926-27?

A.—Yes.

Q.—I want to suggest to you that these programmes are absolutely futile and have no solid foundation of any kind whatever. Then on page 101 is the first statement about the "Kalu". This is the 3rd November, 1923. "I also recommend that very early action be taken in putting the dredger "Kalu" into working order and arrange for any additional pipeline and a terminal pontoon, if such are required."

A.—Yes.

Q.—That is the beginning of that season, November, and therefore nothing whatever could have been done by the "Kalu," nor could you have had those additional pipelines until the end of the season, and that is throwing it all forward to 1924?

A.—Where is that?

Chairman.—That is Page 101, the last paragraph but one: "I also recommend that very early action be taken in putting the dredger 'Kalu' into working order." She was bought in November, 1919, was she not? "And arrange for any additional pipeline and a terminal pontoon if such are required." Sir Frederick's question is: Having regard to the fact that that letter was written in November, 1923, did not that mean that the "Kalu" must have been out of commission the whole of that season—November to March or May; and also could not do any more work until the following October or November, 1924? That seems to be so, does it not?

A.—Yes. It states in this letter: "I recommend that very early action be taken in putting the dredger 'Kalu' into working order." That is not to say that I for my part had forgotten the existence of the "Kalu"; it does not mean to say that every year I was out there I had not spoken about the "Kalu."

Sir Frederick Hopkinson.—But had you?

A.—Yes, I had.

Q.—Well, there is no suggestion here that they have not been carrying out your wishes. It comes as a new thing. "I also recommend"—as if it were something fresh.

A.—I do very distinctly remember that I was constantly pressing upon them to do something to the "Kalu".

Q.—Did they ever give a reason why they did not do it?

A.—No. The reason was that Mr. Lewis did not seem inclined to do it.

Sir Frederick Hopkinson.—Now I want you to look at the bottom of Page 103 where Mr. Lewis makes a statement. I do not know to whom it is made; it is simply dated 21st November, 1923.

Chairman.—It is evidently a memorandum to the Director of Development.

Sir Frederick Hopkinson.—He says: "I would point out that we are by no means sure that the filling from the harbour is going to be of use as a means of reclaiming the area". Surely that was a very alarming statement, was it not, made in November, 1923, as to whether the whole scheme was not going to be valueless as originally proposed?

A.—This is a note, I think, to the Director of Development. I saw it for the first time the other day. I do not think I have seen it before. We are back on the old subject which I emphasised in my statement, that Mr. Lewis got very pessimistic about the drying out qualities of the material in the harbour. This is November, 1923, and it was about this time——

Q.—Just before the dredger was to start?

A.—Yes.

Q.—My question is, is not that a very disturbing statement to make at this period?

A.—Yes, if you do not know all the circumstances.

Q.—But even if you do know all the circumstances, it is disturbing as a statement from the chief engineer—a man who was responsible out there for the carrying on of the work. He did not know that the material, which you had spent three-quarters of a million in providing dredging plant for, was going to be any use for the purpose intended?

A.—I think you examined Mr. Lewis about this, did you not?

Chairman.—It must be disturbing one way or the other. It is extremely disturbing if Mr. Lewis is right that the material is unsuitable, and it is extremely disturbing if Mr. Lewis is wrong, because he is your chief engineer. It is disturbing either way?

A —Yes.

Sir H. Courthope-Munroe.—Might I suggest that he was " the " chief engineer and not " your " chief engineer?

Chairman.—The chief engineer.

Sir Frederick Hopkinson.—He was the resident engineer, and his title was altered.

Sir H. Courthope-Munroe.—But it is " the " and not " your ".

Sir Frederick Hopkinson.—He was the resident engineer and then his title was altered, but his work was not altered?

A.—Mr. Lewis was obsessed with the idea, as I have already said in my statement that he could get the whole of the material from Back Bay.

Sir Frederick Hopkinson.—He has given a specific quantity. He said he found 24,000,000 or 25,000,000 yards, did he not?

A.—Yes, and at Page 106 of my statement I quote a letter to Sir Lawless Hepper in which I say : " In the matter of dredging it seems to me that for some reason of his own Lewis has made up his mind to delay operations as long as possible and to begin reclamation at Marine Lines instead of at Colaba." Later on we had to protest and say that we could not agree with his proposal that the whole of the material should be obtained from Back Bay. It was a complete reversal of the whole programme. He was obsessed with that idea.

Q.—But having seen that mud here in this room, do not you think there is something to be said for Mr. Lewis' point of view? Was not it sufficient to disturb him to think that that was the material he was going to get for making a reclamation which was to be finished and developed in 1928? Do not you think he was justified in fearing that it could not possibly be done?

A.—Subsequent to his writing on that date he got a lot of that identical mud and put it into an enclosed area, and it did dry out, and he was very pleased with it.

Q.—You remember when I asked you the question as to whether you had known that was the kind of material before you advised the Bombay Government, you hesitated a good deal before you said it would not alter your opinion—and I think very properly so, too, if I may say so. I cannot conceive much worse material for reclamation purposes?

A.—Yet we can produce examples from different parts of the world where quite as bad material has been used.

Q.—A great deal depends on what you are going to use the reclamation for. If you are going to make streets and to build houses on it, I should think you could not have anything possibly worse?

A.—The advantage of that reclamation is that the foundation is all rock.

Q.—Yes, when you get down to it?

A.—Yes, when you get down to it.

Q.—But you have got to get down to it?

A.—Yes, you have got to get down to it.

Q.—Besides, you do not know that it is all rock anywhere near the surface, any short distance from the shore. There are no borings or anything to show that. On page 104 Mr. Lewis was equally confident that the dredging was going to be finished by 1927. He is still going on that arithmetical computation of yours, that the dredger was going to work so many days a year and so much an hour, and therefore it would do 5,000,000 cubic yards in a year. He goes on to say : " This will be incorrect probably as to area (7) and would have to be altered as experience is gained; but it is as accurate as any other forecasts."

A.—Yes.

Q.—I think Mr. Lewis did see occasionally. Then on page 114, in May, 1924, Mr. Lewis is writing for a lot more plant for the dredging programme?

A.—Yes.

Q.—He suggests the purchase of the " Jinga " because it had got a bad hull. So far as I can understand, he proposed to take the engines out of the " Jinga," scrap the hull, and put them on a pontoon, or something of that kind?

A.—Yes.

Q.—And buy a barge for an independent pumping station. This makes four dredgers against two contemplated in 1919?

A.—Yes; but might I just make a remark? I would like to point out that there are a number of comments to make, especially on this one dated the 10th December, 1923.

Chairman.—What is the page?

A.—104. I should like it noted there that the chief engineer corresponded freely with his chief, the Director of Development, as he should do; but we never saw any of this correspondence. Perhaps there is no reason why we should. He was the chief engineer and the Director of Development was his chief; but we never had any copies of this correspondence sent to us.

Sir Frederick Hopkinson.—On 7th May, 1924, we come to another dredging programme of yours in which you propose that the " Kalu " and the " Colaba " work together in Back Bay, and the " Lloyd " works alone in the harbour. That means that the " Lloyd," working alone, could only reach 5,000 feet from the point where dredging was taken until its final point in the reclamation. Therefore its work would be very limited?

A.—Yes.

Q.—Then you come to another one on page 117, on 5th June, 1924, whereby the " Kalu " was to dredge flotation in Back Bay, and on page 118, the " Kalu," the " Colaba," and the " Lloyd " were to do long-distance pumping. I cannot reconcile the two at all.

A.—These were all different programmes got out to assist the Development Directorate as the situation developed.

Q.—Then on the same page, 118, there is a suggestion from your firm of an entirely new development, namely, that of an electrical pump. Where was that to be put? This on the 2nd May, 1924.

A.—Yes.

Q.—If you were going in for a new electrical pump, that would have meant you could not have used it for 18 months. That is taking you into December, 1925. Could you tell us what the electric pump was for?

A.—Why do you say that?

Q.—A big thing like that cannot be bought off a shelf. You have got to get it made. They do not exist.

A.—We suggested that he should investigate the possibility.

Q.—What is it for? What has it to do? Where is it to work?

A.—It was on the supposition, according to all these borings, that there was all this material in Back Bay.

Q.—Where was this to work? Was it for Back Bay, or was it for the harbour?

A.—Obviously, to work in Back Bay.

Q.—The electrical pump?

A.—Obviously.

Q.—Where was it going to be put?

A.—Obviously, it was to be used in conjuction with the " Kalu " in Back Bay on the supposition that there was all this wonderful material there.

Sir Frederick Hopkinson.—But there is nothing to suggest that it was going to work with the " Kalu " at all.

Chairman.—I think, if you look at it, it says: " We agree with you that for use with the ' Kalu ' a second intermediate pumping station is desirable." That is what was being discussed?

A.—That is what was being discussed.

Q.—It had been mentioned before, and Mr. Lewis had put forward the purchase of the " Jinga " : " We note your remarks as to the proposed purchase of the ' Jinga.' " That would be as a second intermediate station, would not it?

A.—Yes.

Q.—" But we suggest that before taking any action in this respect you should investigate the possibility of using an electrically working pump." That was the alternative to buying the " Jinga "?

A.—Yes; that was the suggestion. I see that on the 12th June, 1924, again trying to keep a curb on the expenditure, I wrote to Sir Lawless Hepper and said: " I may say we have given the whole subject prolonged consideration, and we cannot understand why Brims requires the enormous quantities of pipes for which he has indented."

Q.—Is that in the print?

A.—No; this is a letter of which I do not think you have a copy.

Q.—There is a letter very similar to it at pages 126 and 127.

A.—Yes. In the same letter I say: " The diagram showing the method of filling the military area sent us by the letter dated the 28th April, 1924, is to us quite inexplicable."

Sir Frederick Hopkinson.—Whereabouts is that?

A.—That is a letter which is not in the book of correspondence. It is really a question of one party making orders and having no power to tell the other party what they are to do.

Q.—This is just a casual remark about the electric pump. Then there is another letter which follows suggesting that you are going to generate your own electricity by Diesel engines. That is another new phase. That is page 130: "We are disposed to think that if you cannot get electricity from the Tata Supply Company it will be quite worth while to have a small electrical installation of your own worked by Diesel or semi-Diesel engines." There we are getting to July, 1924. That could not possibly be available until October or November, 1925.

A.—I would not say that; but that, again, is a suggestion for them to consider. We did not dictate.

Chairman.—At page 127 you say: "In any case, you will not require the second intermediate pumping station for the coming season's work."—

A.—Yes.

Chairman.—So that you did not recognise this plant could not be got out until, as Sir Frederick Hopkinson says, October, 1926?

Sir Frederick Hopkinson.—To continue the correspondence: at the bottom of page 130 you telegraphed to them that you are "anxious about dredging. Have you made arrangements regarding engagement of complete staff for working double shift on all dredgers?"

A.—Yes.

Q.—You knew exactly what arrangements had been made because you had sent all the men out from England. I suggest it was for you to say you are to work double shift, or treble shift, whichever you like; and therefore so many men will be necessary, and saying how many men will be necessary, and that you would arrange to send them out?

A.—There I must dissent absolutely. My firm had no authority whatsoever to say to the Development Directorate: "You have got to do this," or "You have got to do that." "You have to work one shift," or "You have got to work two shifts."

Q.—We must carry this a little further. You have the responsibility for completing the work in five years. One of the essentials for doing that is that your dredger should be working 24 hours a day, is not it? Is there any correspondence in which you told the Development Directorate that until they worked the dredger 24 hours a day, 15 hours' pumping time, the scheme could not be carried out?

A.—Well, it was obvious without putting it in the correspondence.

Q.—You are involved in this because you have given the Government an estimate for doing it in five years?

A.—Yes; but I am not responsbile for the carrying out of the work. I say that I had no responsibility for the expenditure, and I had no responsibility if the Government chose to be dilatory. I put in a letter the other day from Mr. Lewis in which he, as chief engineer, says he had written four letters to the Government and had asked for sanction to engage the additional dredging staff. He said: "Here you are. I have written four letters. I cannot get any reply. What am I going to do?" You cannot force a Government to do things—at least I cannot.

Q.—Will you turn to page 131? We come to another thing then. This is a letter from Mr. Elgee to you in which he speaks of two booster pumps being required. That is making a new pump. That is August, 1924. Does not this boil down to the fact that nobody, either in London or in Bombay, had anything but the very faintest ideas of how they were ever going to do the work?

A.—No; I do not agree.

Q.—We have had all these variations, and now we come to another one in August, 1924—two booster sets in addition to the three you have already got.

A.—No.

Q.—You have got three floating ones?

A.—We are talking about booster pumps.

Q.—There are three floating ones and one electrical one, and now another one. There are the "Kalu," the "Colaba," and the "Sir George Lloyd"—that is three.

A.—Those are not booster pumps.

Q.—They are not; but those are three, two of which were going to do the entire work. You have got three, and now you have the "Jinga," a floating booster, or electrical booster—I do not know which—and now you come to another booster, which makes two booster pumps. That is five pumps to do the work of two.

A.—I cannot be responsible for this letter. Mr. Elgee says that he thinks two boosters will be required, but I do not think that I am responsible for that.

Chairman.—The only point of the letter is this. Sir Frederick Hopkinson puts it to you : Does this letter of the 8th August, 1924, with all this backing and filling, and so on, show that nobody really had any set deliberate plan, even at this date of August, 1924? That is the only question you are asked.

A.—There were plenty of definite plans. Let me put to you a case, viewing the matter in another way. The original programme for dredging was in the harbour—in very suitable material. Then, due to the action of the Port Trust, we had to look about for new area, and we propose to go further out into the harbour, involving more pipe line. Then the chief engineer and the Director of Development initiated the programme for Back Bay. That involved another dredging operation in Back Bay as well as dredging operations in the harbour. If you go from step to step you can see how the various programmes have been worked out. We did not initiate Back Bay. We did not approve of Back Bay. Now that the borings have turned out to be erroneous it seems a pity they ever went to Back Bay; but the chief engineer was obsessed with the idea that he would get an enormous amount of material from Back Bay. That is how these various programmes originated. First of all the Port Trust and the Indian Marine took away a large area. Then we made other arrangements, and then the Development Directorate, on their initiative said : " Let us go to Back Bay." You can follow the thing through, and I dissent entirely from the suggestion that we are a set of fools, the whole lot of us, and we never had any programme at all, and we did not know what we were doing. We gave the matter very serious consideration.

Sir Frederick Hopkinson.—Answering one or two of the things you have said, it is true the Indian Marine took away a certain area up here (*pointing on the plan*)?

A.—Yes.

Q.—But that is from 75,000,000. They still left you with more than you wanted. Moreover, all you had to do was to come out here to get it nearer than that, so that you had no limitation of material at all, but you had ample material without going to Back Bay at all. The reason you went to Back Bay is the very obvious one, that it was physically impossible to do the reclamation with the plant you had provided. It had not power enough?

A.—No, I do not subscribe to that idea at all. It is perfectly true that there was material available, but in another position.

Q.—Equally convenient or more convenient?

A.—I do not think so.

Q.—It is a matter of measuring it off. It does not involve more pipe-line, it involves less pipe-line. Now what about these erroneous borings? You have said several times that the borings in Back Bay are erroneous, but that is the only statement that has been made by anybody about their being inaccurate. So far as we know, they are perfectly accurate. They give you the depth of the moorum or rock in a very large number of places?

A.—Well, I think we have reason to suspect that a lot of them never were taken at all.

Q.—No wonder the Back Bay scheme is where it is.

A.—We did not take them. We had nothing to do with the taking of them. I notice, if I may interpose a word, that at page 133 there is a letter of the 18th September, 1924, which shows the way in which the dredging masters were selected. It is a letter from the Secretary to the High Commissioner for India in London to the Secretary to the Government of Bombay.

Q.—They ought to have been out there then for that season's work.

A.—But see the routine, and you see the difficulty in getting the people. The Governor of Bombay sends a telegram to the High Commissioner for India, asking whether, in consultation with Messrs. Meik & Buchanan, certain dredging masters may be appointed. Then there is a Selection Committee on the dredging masters, and the terms of engagement, the salaries and allowances, and so on, were made by the Government of Bombay entirely without reference to us.

Q.—You mentioned this the other day, and I said that all this was done on your recommendation, the Committee though appointed did not know the difference between, a dredging master and an engineer, and they would be taken on your recommendation.

A.- On their terms.

Q.—You agreed to it?

A.—We did not agreed to the terms. We had the terms put before us.

Q.—It was on your recommendation of the men?

A.—Yes.

Q.—The terms did not matter, because the terms were acceptable to the men, or they would not have gone?

A.—Naturally you can get very much better men at higher pay than you can get at lower pay.

Q.—That question has not arisen. Then on page 139, in a letter from yourselves to the Chief Engineer, you say: " You have no doubt been able to form a definite opinion as to the cause or causes of the low output, and we shall be glad, therefore, if you will let us have all information on the matter, so that we can consider it before taking up the matter with the builders." That is because the dredger was only giving 43 per cent. of the specified output?

A.—Yes.

Q.—This is February, 1925. Did you take it up with the builders?

A.—Well, in February, 1925, as a matter of fact, I thought I was going to die.

Q.—Not February—that was August.

A.—No.

Q.—August, 1925.

A.—No.

Q.—In February, 1925, you were on your way to Australia, and were having an ideal sea trip, I have no doubt?

A.—Yes.

Chairman.—This is Mr. Halcrow's letter from London?

A.—Yes, this is Mr. Halcrow's letter. He is a member of the firm. I think you might have asked him about that.

Sir Frederick Hopkinson.—Have you ever heard that he ever took it up with the builders, and with what result, because we have not seen any result?

A.—I will refer to that and see what was done.

Q.—Have you heard that anything resulted from taking it up with the builders—if anything serious was done? If anything of consequence had resulted, you surely would have heard of it?

A.—My impression is that the builders said: " You have got the dredgers and you have got the tests. We are not working the dredgers, and that is all about it."

Q.—You think that is all the builders would say?

A. I think that is all the builders would say.

Q.—But did they? Evidently Mr. Halcrow was under the impression that he was going to get some satisfaction from the builders, or was going to try to get some satisfaction?

A.—Well, what he actually did I will investigate.

Chairman.—What, in fact, happened was that the firm of Messrs. Meik and Buchanan said they had several conversations with the builders, and neither your firm nor the builders could understand why the dredger was not giving its output. I am sure that is somewhere here.

A.—I think I remember something of that kind. There is a letter of the 15th October, 1925, at page 166. Is not that it?

Q.—I am sure there is a passage somewhere making that statement, that neither the builders nor yourselves could understand it.

A.—Here it is at page 166: " The builders are naturally, for their own sakes, anxious that the plant should prove a success, but they are not specialists in the handling and working of dredging plant, and in the absence of any specific complaint about the machinery or any portion of same, it is not clear what good interest could be served by their representative going to Bombay."

Chairman.—That is not the letter. Here it is, page 158: " Since the beginning of the year, we have had several conversations with the builders on the subject, and are in further communication with the Chief Engineer." This is a letter from Messrs. Meik and Buchanan of 25th May, 1925. Then: " Neither we nor the builders can understand why any estimate should be based on a figure which is less than one-and-a-half of the designed output of the ' Sir George Lloyd,' more especially as the less powerful vessels 'Jinga ' and ' Kalu ' pumped much larger quantities over long periods when working on the Sewri reclamation." That shows the conversation, and I believe there is another reference to it. The conversations with the builders evidently would mean with Mr. McMurray.

Sir Frederick Hopkinson.—Yes. I think you told us that early in 1922 Mr. Brims was in London, and you then told him that the dredger was to be double shifted?

A.—Yes.

Q.—But so far as I have seen, there is no other reference in any of the correspondence about this. When the dredger started the first year you single-shifted. I

do not see any letter of complaint from London saying : " Why are you only working single shifted? "

A.—We do not put every complaint in writing.

Q.—But this is a very, very important one—it is a very serious matter, is not it, because it is prejudicing the entire completion of the work?

A.—Yes.

Q.—It is one of the most important things. I just wanted you to tell us if there had been any other reference to it, because I do not remember any.

A.—I do not remember any written reference. As I told you, Mr. Brims went out with orders to work two shifts.

Q.—But you say you had no power to give him orders?

A.—Very well; with the suggestion or hope that he would work two shifts.

Q.—Do you mind looking at page 152, the document dated the 8th April, 1925? The chaos about these dredging programmes apparently leads them to consider the proposal to carry out earth filling simultaneously with dredging operations?

A.—Yes.

Q.—Which seems to be a recognition that the dredgers have failed?

A.—Yes; and later on we scouted the idea, in reply to that letter, and told them to work their dredgers properly.

Q.—Would you mind turning to page 65, paragraph 3 : " Assuming that the dredger ' Sir George Lloyd ' commences to pump from the Harbour to Colaba next November, Sir George wished if possible "—that is you—" that the dredger ' Kalu ' should commence about the same time to pump from Back Bay to Marine Lines. Mr. Lewis said he thought it better to use both dredgers at Colaba, as the land there was of more value to the Development Directorate. That was admitted, but Sir George said that Sir Lawless Hepper agreed with him that it would have considerable moral effect on the whole scheme to complete a section at Marine Lines as soon as possible "?

A.—Yes.

Q.—What does that mean " moral effect "? Why was it to have a moral effect?

A.—Well, I remember that. Sir Lawless Hepper and the Government of Bombay were always anxious that there should be something to show to the people to enamour them of the scheme. Sir Lawless Hepper and I were discussing it, and, as put there, it would have a considerable moral effect—I do not mean by " moral effect " anything to do with public morals, but, to put it in another way, it meant this.

Chairman.—You mean it would be heartening for the people to see considerable progress being made?

A.—It would be heartening for people to see something going on. When we started working at Marine Lines, I know the Government of Bombay was most anxious that work on the gantry should go on, so that everyone driving in the morning should see the work going on, and be heartened, as the Chairman puts it.

Sir Frederick Hopkinson.—" What a wonderful scheme we have going on; we can see it growing day by day."

A.—Yes.

Q.—That is your idea; but do not you think the best moral effect would have been produced by the dredger delivering 2,000 yards an hour?

A.—The people would not have seen that.

Q.—But it has a pretty heavy effect—2,000 yards an hour.

A.—I do not despair of hearing that the dredgers are doing 2,000 yards an hour, if they are given a proper show.

Q.—I would like to lay a little stress on your calculations in your original report, about the daily output of the dredger. Was it your intention that the dredger was to work 24 hours a day, of which 15 hours would be actual pumping?

A.—My idea was that it would pump for 15 hours a day.

Q.—How long would that necessitate the men working?

A.—That would depend on the circumstances, rather. We certainly did not contemplate them going off for meal-times. We contemplated a 15-hours day.

Q.—Fifteen pumping hours?

A.—Yes.

Q.—I still do not understand how you expected to do that in this first season, when you had only one dredging master. The whole thing was laid on the shoulders of one man. If he had fallen sick, your dredger could not work.

A.—Well, you are quoting my own words, Sir Frederick Hopkinson. What did I do? I go to Bombay and I see one dredging master doing the work, and I say : " Good God, look at this; if this man falls sick, your dredging must stop."

Q.—I should have thought you would have said: "Good God, why did not I send out some more dredging masters?"

A.—Must I repeat again that I had no more power to send out dredging masters than you had power to send out dredging masters?

Q.—So far as I can see in any of the correspondence, there were no orders or instructions that 15 pumping hours per day must be worked, in order to carry out the proposed scheme; but you say over and over again that the dredging is the crux of the whole scheme, yet there is no instance anywhere, in any of the correspondence or instructions, that the dredger must work 15 pumping hours per day. Do you agree with that?

A.—Well, I cannot see anything of the kind, but we get up to the old story that without control there was no possibility of making them work 15 hours.

Q.—Then I would like to call your attention to the fact that on 15th December, 1924, you wrote: "The Dredging Department have done all that is humanly possible to get on with the work"?

A.—Yes.

Q.—What does that mean?

A.—I remember that.

Q.—What does it mean?

A.—Well, the individuals.

Q.—No. This is the Dredging Department, not the individuals.

A.—Very well. Take the Dredging Department. Mr. Brims is the head of the Dredging Department; and there had been a lot of difficulties when I was out there. I reported them in my report. There had been difficulties here, and there had been difficulties there; and so far as I could see the Dredging Department, that is to say, Mr. Brims and his staff, had done all that they could to overcome those difficulties. I described those difficulties in detail. They had done all that was humanly possible. I wanted them to realise that I thought they had done all that they could to overcome those difficulties. That is nothing to do with the difficulties of the Government.

Q.—I am dealing with the dredging only.

A.—And the difficulties of getting the men and working 24 hours, and all that part of the thing. That is the explanation of that.

Q.—How do you square that with an accusation that the dredgers have been mishandled?

A.—Well, that comes later on. The dredgers had been mishandled. I call it mishandling the dredgers when they only work for a few hours a day.

Q.—Well, they always worked a single shift the first year, the year you spoke of as the experimental pumping?

A.—I can only say: "Free the work of Government control. Do not let the senior officers' time be taken up writing forms in their office. Give them a free hand to push the work on; but first of all, take it out of Government control."

Q.—That is a thing the Government will consider. I suggested to you the other day that the order of priority for doing the work in your report was not right. The dredger actually began working in December, 1923. If that dredger had been provided in September, 1921, the price of ship-plates at that time was £14 a ton, but at the date the dredger was ordered, they were £24 a ton, which is very nearly double. I suggest to you that had you postponed the purchase of the dredger for 18 months, you would still have been in ample time to do the dredging work, and have got your plant at a little more than half the price you paid for it?

A.—It is always easy to be wise after the event.

Q.—I suggest to you that every day wise people are wise before the event?

A.—Some people are and some people are not. If you look at things to-day, and how things have happened since, naturally you would say: "Yes, we should have saved money if we had bought the dredgers a year later than we did." But when we bought the dredgers it was on a different programme altogether. We hoped that the works would be pushed forward much faster than they were, and that the dredging would begin sooner, much sooner, than it did, and so on, and so on, and so on. According to our lights, we recommended what at that time we thought to be the best.

Q.—The contract time for building the dredger was 14 months?

A.—Yes.

Q.—If you had ordered the dredger and began the works at the same time it would have been different, but actually you did not begin your preparatory works in ordering the plant until about September, 1920, and therefore the dredger which had then been ordered six months would be half built. You had to decide on the method of doing the work, you had to decide on what plant you were going to use; you were going to

order that plant and have it made specially; you were going to get it to Bombay; you were going to open up the quarry and fix all this plant. That left you with only about eight months to do all those things. It is a physical impossibility. You ought to have had at least 18 months for that—18 months to two years.

A.—The original proposal was to let the contract in October, 1920. The contract was actually let in October, 1920, and it was then cancelled because the Governor in Council had decided to do the work departmentally. I was in London, and the dredger had been ordered when we got the intimation that the programme had been changed and that the Governor in Council had decided not to go on with the contract. As regards arranging for the quarry, we had nothing to do with arranging for the quarry; that was entirely done by the Development Directorate.

Q.—It was not the actual arranging I am speaking of, but it was the provision of the time for doing the work. That you were controlling—do not forget that—because you ordered the dredger. You made the programme. You were laying down the programme. All the machinery was designed or arranged for in your office by Mr. Lewis and Mr. Meik.

A.—By Mr. Lewis.

Q.—And Mr. Meik, because Mr. Lewis told us that Mr. Meik overrode him.

A.—Overrode him?

Q.—Yes, about the gantry, for instance?

A.—Well, I should like to read Mr. Lewis's evidence.

Q.—He said Mr. Meik said how the work was to be done.

A.—Mr. Meik certainly did not order the plant.

Q.—He did not actually order it, but he decided what plant was to be ordered?

A.—No, I disagree, because Mr. Lewis came home specially to order the machinery for the quarries. He had a free hand in ordering the machinery for the quarries. He knew everything that was wanted for the quarries, and he came home. He saw Sir Lawless Hepper when he was at home, and he ordered the machinery.

Q.—Actually he told us that Mr. Meik was advised by a contractor in London not to build that gantry, but he insisted upon doing it because he said it would be more convenient. That is what Mr. Lewis told us.

A.—Yes; that is talking about the gantry, but I mean the general arrangement.

Q.—That is one of the proposed arrangements?

A.—Yes.

Q.—In your report of 15th December, 1924, stating the reason for the alteration of programme, you say: "The proposed pipe-line involves such an immense amount of costly and difficult work that all idea of a pipe-line in that vicinity should be abandoned." That existed in 1919, did not it?

A.—That existed in 1919.

Q.—And should have been foreseen?

A.—No. Mr. Kidd investigated it for this pipe-line, and Mr. Kidd never considered——

Q.—We are dealing with your pipe-lines—we are not dealing with Mr. Kidd's pipe-lines—which run along Ormiston Road. I say that should have been seen early in 1919. Now I am coming to rather an important point in connection with the dredging, and that is this: You calculated getting 2,000 yards an hour for 15 hours a day?

A.—Yes.

Q.—That would be under average conditions—an average output for those 15 hours?

A.—Yes.

Q.—I suggest to you that a prudent and experienced man would provide that the dredger's maximum output on trial should be nearly double that in order to get 2,000 yards average?

A.—Well, that is a matter of opinion. You get a reputable firm of builders who give you a plant which they say will give 2,000 cubic yards for 15 hours.

Q.—On trial; but they did not say in their tender it would do it as an average?

A.—There again these are not the only dredgers these people have made.

Q.—We are dealing with this particular dredger, and do not let us get away from it. They contracted to give you a dredger to deliver at the rate of 2,000 cubic yards an hour on trial, and they say they have fulfilled that condition, and the marine architect has agreed with that?

A.—Yes.

Q.—My suggestion is that a prudent and experienced man, a man who knew of all the delays likely to arise in connection with dredging, would provide that the maximum output should be nearly double the average output?

A.—Well, that is entirely a matter of opinion. If you had had a dredger that dredged 4,000 cubic yards an hour under the conditions that prevailed in Bombay, you would not have got the output.

Q.—That is not my point.

A.—Under the conditions which prevailed in Bombay.

Q.—That is not my point at all. A machine designed to give an average output should be designed to give a much greater test output for a short period. It is not a question of opinion; it is a question of ordinary daily common sense and experience.

A.—Well, you have your opinion on that, but I should like to have evidence on that. Let us see what has been done.

Q.—Can you tell me any machine doing such work as a dredger that is going to work at 100 per cent. efficiency for 15 hours at a time?

A.—Not 100 per cent. efficiency for 15 hours at a time, but 15 hours out of 24.

Q.—Well, 15 hours out of 24 at 100 per cent. efficiency at each hour; that is what it has to do. You are reckoning on it working 15 hours?

A.—Yes.

Q.—I suggest to you that it really is absurd to expect a machine to do that?

A.—Well, I cannot agree with you, and I think if you search among the records there are of dredging plants you will find it has been done.

Q.—That what has been done?

A.—A dredger has done it.

Q.—That is, its test output is taken as its average output?

A.—No; that a dredger of this kind, capable of delivering soft clay a distance of 5,000 feet at a rate of 2,000 cubic yards per hour—I think the records will show you that it has been done for continuous periods.

Q.—You think so. How about the "Kalu" and "Jinga"? Is not that a case in point that was prominent before your eyes? They fulfil their test out there, but their average load was only about 50 or 60 per cent.

A.—Yes.

The Chairman.—1,126 was the average.

Sir Frederick Hopkinson.—A little over 50 per cent.—is not that an illustration?

A.—I do not think it is. I would like to say a word about the "Jinga" and "Kalu." I said to the Chairman the other day that I had not seen Mr. Messent's note. As a matter of fact I had forgotten the particular note, but two or three days ago when I was looking over my records I came across the copy which obviously had been given to me by Mr. Messent, because it had his own signature upon it. Well, I read the note through very carefully naturally, but I cannot find in Mr. Messent's note anything condemnatory of the dredgers, obviously when you read this report it is plain the work was done in a leisurely manner—there was no particular hurry. But there is nothing in Mr. Messent's note to say that he is dissatisfied. He puts on paper a plain record, and there is nothing to show he is dissatisfied. I was reading Lord Lloyd's evidence the other day, and I read what he said about the Sewri reclamation works.

Q.—I entirely agree with Mr. Messent. If he had only specified for a test output and was satisfied with 50 per cent. of it, he had nothing to complain of. In fact, he confirms what I have said, that he ordered his dredger to do 50 per cent. more than he expected to get.

A.—Why all these complaints about the "Jinga" and "Kalu"?

Q.—I am suggesting to you that a wise and prudent man would have specified for a dredger that would have done something between 3,000 and 4,000 yards an hour on a test, in order to make certain of getting 2,000 yards an hour under ordinary conditions.

A.—Well, I say again that is a matter of opinion.

Q.—I suggest to you that there is no question of opinion about it whatever?

A.—Well, I do not agree.

Q.—In connection with the clay there is one point I should like to ask you about. You told the Chairman the other day that your references to hard clay meant clay in relation to its hardness in the reclamation?

A.—Yes.

Q.—On June 22nd, 1921, you use these words in a letter: "as we hope there will be a great deal of hard clay in the harbour."

A.—Yes.

Q.—I suggest that does not mean in the reclamation, but it means what it says—that the clay is hard in the harbour?

A.—Well, we have talked a great deal about the clay.

Q.—I thought probably you had not got this particular letter before you?

A.—Yes I had. I could never possibly in the highest flights of imagination believe that the material we were going to dredge in the harbour was hard clay, in the sense of being hard for the dredger to cut.

Q.—But you say you hope there will be?

A.—But hard there again ——

Q.—You call it hard clay. I am only taking your own words.

A.—Hard clay—well, I have talked very much about hard clay and soft clay and unctuous clay.

Q.—You have always defined it as meaning hard clay in the reclamation?

A.—Yes.

Q.—I am pointing out to you that you have given another definition yourself here—that is hard clay in the harbour. That is before you touched it—nothing to do with the reclamation at all, but " in the harbour "?

A.—Well, I repeat, whatever I said, that I could never have meant hard clay for dredging, because I knew perfectly well there was not any.

Q.—I agree with you that it is a very difficult thing to try to explain away. I sympathise with you.

A.—I do not agree at all. Once one starts to define what is hard and what is soft, you get involved in all kinds of language. You can have a hard boiled egg.

Q.—You can have a hard drink and a soft drink.

A.—Yes, and you can have a hard-mouthed horse.

Q.—You can have a hard head and a soft head.

A.—You can have clay that is soft and you can have steel that is soft and hard.

Q.—We know what " hard " means in connection with clay. I was very much interested in some tables given to us the other day by Mr. Settle. He gave the velocity of the effluent from the pipe as the same as Sir John Biles said was to be expected. In order to get 2,000 yards an hour the solid matter would have to be on an average for the whole 15 hours a day of no less than 14 per cent. in clay. Everybody who has given evidence before us has agreed that when you get 10 per cent. you are doing quite satisfactorily. Ten per cent brings us back to something like what the dredger has done. You will excuse me being rather disjointed, but the Chairman has been so exhaustive that I have to pick out the little points which he has not touched upon. There is one thing I would like to get on the notes, and that is this. The project estimate is stated to be 702 lakhs?

A.—Yes.

Q.—It really is not anything of the kind. It is 813 lakhs, because it is 775 lakhs without deducting the reclamation value of the dredging plant and the other plant. To that must be added 38 lakhs for concrete blocks omitted—that is, to compare it with the original estimate, you must add those 38 lakhs. That brings you a total of 813 lakhs as the gross project estimate.

A.—That seems rather curious arithmetic. The project estimate was 702 lakhs. You cannot go and add 30 lakhs which you are not going to spend.

Q.—I mean for the purpose of comparison with the original estimate?

A.—Yes.

Q.—You cannot compare one with the other if you do not do the whole thing, can you?

A.—Well, when you come to comparisons of that nature you can carry it on indefinitely.

Q.—Do you mind giving me the blue file of yours that you lent me the other day, of the estimates? (*Same handed.*) This is my last subject, I am glad to say. I noticed in looking through this the other day that nearly all the estimates of various things are in manuscript, but when I come to dredging it is in type?

A.—Yes.

Q.—And appears to have been torn off a full page?

A.—No; that is the copy out of the file; that is the exact copy.

Q.—Out of the file of what?

A.—Out of the file of one of our office files.

Q.—To me this is nothing in the nature of an estimate at all. It simply says dredging so much, and the working expenses, wages, fuel, stores, run into millions of rupees?

A.—Yes.

Q.—I do not see how that can be called an estimate. Where are the details of that? Who worked those figures out in order to arrive at the price of dredging?

A.—They are worked out in the office.

Q.—Who really worked them out? Can he give us the details on which he arrived at these?

A.—I really could not tell you. But what is the matter with them?

Q.—This is only a bald summary; it looks as if it had probably been supplied to you by somebody else.

A.—As a matter of fact, there is a great deal of detail in it. We do not always go into such details.

Q.—Take the working cost, wages 720,000 rupees: what does that mean—how many men and how many dredging masters? It is no estimate at all to me. Then fuel, 1,680,000 rupees. It does not give the quantities or the prices. How can it possibly be checked?

A.—Well, we do not make estimates the way that contractors make estimates. As you know perfectly well, we go by comparisons with other works. Certainly we got that out as an aid, but I would like to give you some records of the actual dredging costs in other works.

Q.—Are they under the same conditions?

A.—Yes, more or less the same conditions.

Q.—Are they with two dredgers, because this is quite unusual dredging at Bombay, is it not?

A.—It is quite unusual dredging—yes, I suppose it is—but the working costs of dredgers are fairly uniform.

Q.—According to this, the cost of dredging, steam dredger and steam float shore delivery was going to be 7·35 annas per cubic yard. Can you tell me, if dredging costs are fairly uniform, why it cost you 1*s.* 6*d.* in Rangoon?

A.—It did not cost 1*s.* 6*d.* in Rangoon.

Q.—My information is taken from your published figures.

A.—I should like to see that very much.

Q.—It is in the Institution of Civil Engineers' Journal?

A.—I should like to see it.

Q.—Here is the volume. (*Same produced.*) It is 1*s.* 6½*d.*

A.—May I see it?

Q.—Certainly. (*Same handed.*)

A.—There is no statement there that the dredging cost is 1*s.* 6½d. It is an inference of yours.

Q.—It gives the quantity done, and it gives the total cost, and the one divided by the other gives 1*s.* 6½*d.*

A.—If I may say so, that is absolutely misleading.

Q.—It is?

A.—Absolutely.

Q.—Why was it ever published if it was misleading?

A.—I say that that inference of yours is absolutely misleading.

Q.—It is not an inference, it is a calculation.

A.—I would like to read you some notes about dredging.

Chairman.—Let us get that accurate. Apparently, this is a lecture or paper read at the Institution of Civil Engineers?

A.—Yes.

Q.—At which a certain amount was said to have been the cost of the work, and a certain volume of work was done?

A.—Yes.

Q.—Sir Frederick Hopkinson has divided one by the other, and says it works out at 1*s.* 6½*d.* per cubic yard.

A.—Yes.

Q.—That is right, is not it?

A.—No.

Q.—Why is not it right? Will you explain it to him?

A.—He has taken the whole cost of the dredger.

Sir Frederick Hopkinson.—I have taken the net cost after sale.

Mr. Billimoria.—Do not the figures speak for themselves?

Sir Frederick Hopkinson.—I am afraid the figures shout for themselves.

Chairman.—You might just look at these figures and see if it is right. You have told us that the dredging did not cost 1*s.* 6½*d.* Take your own time about it, and just see whether Sir Frederick Hopkinson is right about that, on your own statement to the Institution.

A.—Well, I do not think he is right.

Q.—Why not? He says that five divided into 20 goes four times.

A.—It will take a few minutes to check this, but I do not think that he is quite right.

Sir Frederick Hopkinson.—My own is only a calculation.

A.—As a matter of fact, I can tell you the actual cost of the dredging in Rangoon.

Sir Courthope-Munroe.—Perhaps you will let Sir George deal with that after lunch. It has been sprung on him in this, and he wants time to develop it.

Sir Frederick Hopkinson.—Yes; but I did mention it the other day.

A.—" The suction pump dredger ' Pelican,' working in Rangoon in 1912 and 1913 in sand and silt, moved 2,000,000 tons at a total cost for working expenses of 1·90 annas per cubic yard."

Q.—Where is that? That is different to the information published in that book. Moreover, the information published in that book said that she did not move 2,000,000 yards, but the 2,000,000 was done partly by dredging and partly by scouring. Subsequently a letter was written by your late partner Mr. Meik, in which he said the total dredging done was 1,000,000 cubic yards?

A.—Well, this is an official record which I have got—1·90 annas per cubic yard.

Q.—Obviously that is wrong, or Mr. Meik is wrong. If one says 2,000,000 and the other says 1,000,000, they cannot both be right. When you first went to Simla you told them there that your estimate for dredging was 6 annas a cube yard. The work in Rangoon is pre-war prices?

A.—Yes.

Q.—Does that include the dredger?

A.—No.

Q.—That is only the working cost?

A.—The working cost.

Q.—That was sand and silt?

A.—That was sand and silt. I have got a lot of information about dredging.

Q.—I shall be glad to know where it has ever been done for 2 annas a cubic yard post-war.

A.—Well, 1915, I suppose you would call pre-war, or post-war—I do not know.

Q.—Where was it?

A.—In Burma. You might kindly note that Mr. Messent, when I saw him in 1919, told me that the working costs of dredging between pre-war and 1919 had only increased by 20 or 25 per cent.

Q.—I am afraid I should believe that with a good deal of difficulty.

A.—That is the chief engineer of the Port Trust.

Q.—I doubt that, knowing the rates of fuel and wages.

A.—Would you like me to give a little experience of dredging? It would only take me a minute.

Q.—Certainly.

A.—I have taken an opportunity of looking through some of my records. This is what I have got to say about dredging costs: In estimating dredging costs two factors must be considered, capital cost of plant per unit and working cost per unit. The capital cost naturally varies according to the quantity dredged, the greater the quantity the less being the capital cost. In two dredging propositions of, say, 10 million cubic yards and 5 million cubic yards respectively, executed by similar dredgers, the capital cost per unit of the large scheme would be less than that for the smaller scheme, if the total cost of the plant was debited against each scheme. Working expenses, however, are fairly uniform, and comparisons can be made with different works. In my 1919 report and estimate I calculated that capital cost of plant would be 3.24 annas per cubic yard, and working expenses 2.66 annas—total 5.90 annas; but in my estimate I allowed 8 annas per cubic yard, an increase of 2.1 annas, or on the total the sum of Rs. 32,81,250, say £216,000; whilst dividing 2.09 annas equally between capital and working expenses, we have capital cost 4.39 per cubic yard, working expenses 3.61 per cubic yard. It has been freely stated that my estimate of 8 annas was too low because Mr. Kidd's tender, made in 1912, was 9 annas 3 pies per cubic yard. I again assert most positively that my estimate was a reasonable one, and that Mr. Kidd's was excessive. Mr. Kidd gave no details in his tender, but in the course of his evidence before the Committee, said his dredging plant was estimated to cost in 1912 £287,625, which converted into rupees at 15 and divided by 24,162,463 comes to 2.86 annas per cubic yard. I consider his price for plant in 1919 high, but assuming that amount is allowed, there is left for working expenses 6.39 annas against my figure in 1919 of 3.6. The easiest way to see which figure is correct is to take reliable figures of cost of

dredging executed elsewhere about that time, and I will therefore quote figures in my possession which I used to check my estimate. Take the Twante Canal, Burma: This project was the nearest in approach to the Bombay scheme. Three suction cutter pipe line dredgers were used, the material was clay and silt, and the total working expenses for the six months ending 30th June, 1915, was annas 1.83 per cubic yard, and for the previous six months 1.88 annas per cubic yard, and from the beginning of the work in 1912 the dredgers had excavated 10,420,000 cubic yards, the total working expenses being 2.01 per cubic yard. To take some more examples from my records: Dredger "Pelican"—The suction pump dredger "Pelican," working in Rangoon in 1912 and 1913 in sand and silt, moved 2 million tons at a total cost for working expenses of 1.90 annas per cubic yard.

Q.—I hope there is not going to be the same conflict in all the other cases as there is in this case, because your partner says 1,000,000 yards was done, and the cost was 1s. 6½d.

A.—The suction dredger "Balari": This is a large suction dredger working on the Hooghly, and an analysis of her work in 1914 gave total working expenses of 8.40 pies per cubic yard. The suction cutter pipe line dredger "Foyers": Working in Bengal in 1914 moved 3,200,000 cubic yards at a total working cost of 10 pies per cubic yard, and working from 1908 to 1915 moved 14,230,000 cubic yards at a total working cost of 1.16 annas per cubic yard. These examples from actual work done are, I think, sufficient, and surely with these figures before me I was justified in thinking Mr. Kidd's estimate of 6.39 annas most excessive and my estimate of 3.71 annas ample—the difference between Mr. Kidd and myself on the whole 25 million cubic yards being Rs.53,22,000, or over £350,000. I have no information in detail as to the cost of dredging in Bombay on the Back Bay scheme, and am perfectly satisfied that with proper organisation and continual working enormous economies can be effected. These figures are taken from official documents which show that the dredging in 1915 was in the neighbourhood of 2 annas, and less, per cubic yard.

Q.—You want to be very careful in comparing these figures. For instance, in the Twante Canal, Burma, you have three suction cutter pipe line dredgers being used, but they would be working independently?

A.—Yes.

Q.—Did they deliver 5,000 feet, or only just a few hundred feet?

A.—No; they did not deliver 5,000 feet.

Q.—Then you cannot compare it. Can you compare that with two dredgers working on the same pipe line? Your costs are double, are not they?

A.—No; not double.

Q.—How much less does it cost to run the "Colaba" than the "Lloyd"? The only thing that the "Lloyd" does that the "Colaba" does not do is to cut clay and lift it. She does not lift it any more than the "Colaba," so that the costs are almost identical.

A.—No; I will not admit that, but, however, here are the figures showing what the dredgers can do. You can take them for what they are worth. Those are figures taken not working 24 hours a day. Most of these were Government works, being done in a more or less leisurely way. They are not contractor prices.

Q.—I have shown that they are not comparable. For instance, your dredging plant in Bombay cost you 8 annas, as much as your total estimated cost. You cannot say there is any uniformity in dredging prices when that sort of thing happens.

A.—But there is a certain uniformity in dredging costs.

Q.—There is no uniformity in the figure you have given us. You give us there 8.40 pies, which is less than a penny a cubic yard.

A.—Less than a penny. These figures are given you to show there is still hope of reducing expenses in Bombay.

Sir Frederick Hopkinson.—Do not ask me to take a contract on these prices, Sir George.

Chairman.—Would you between now and half-past two just work out that calculation which Sir Frederick Hopkinson has put to you—that the cost in Rangoon is 1*s.* 6½*d.* per cubic yard?

A.—Yes.

(*Adjourned for a short time.*)

Chairman.—In the report of Lord Lloyd's examination contained in a Bombay paper which has arrived by this mail, the summary of the evidence does not accurately convey what took place. In Bombay Mr. Cowasji Jehangir had said that Lord Lloyd took away a good deal of private correspondence. Sir M. Visvesvaraya put questions to

Lord Lloyd to ascertain if any of that correspondence was relevant and available. There was nothing in any of the questions put by Sir M. Visvesvaraya which in any way suggested any impropriety on the part of Lord Lloyd; indeed Sir M. Visvesvaraya expressly disavowed it. The object of the questions was to get, if possible, information which would give the Committee the circumstances under which the decision was arrived at to undertake the scheme.

Sir H. Courthope-Munroe.—I was going to ask this, Sir. We have been, at your request, during the adjournment at some little trouble to arrive at this 1*s.* 6*d.* The best we can do in the way of arithmetic is to arrive at 8*d.* Sir Frederick Hopkinson asked "Can you tell me at what cost?—(A.) No, I cannot. (Q.) I will tell you, then. It cost 1*s.* 6*d.* a cube yard." I rather gathered from that that it appeared in the Lecture or in the Address which was given by Sir George that he stated 1*s.* 6*d.*

Chairman.—I did not quite gather that.

Sir H. Courthope-Munroe.—I may be wrong.

Chairman.—What I gathered was that the figures given in the Address enabled Sir Frederick to get out the calculations.

Sir H. Courthope-Munroe.—It is a little hard on Sir George.—He has put together every figure he can find, and he cannot arrive at anything but 8*d.* Sir Frederick Hopkinson says his figure is 1*s.* 6*d.* I have not the privilege of cross-examining Sir Frederick, but no doubt he will tell us the sum by which he arrived at 1*s.* 6*d.* in order that we may clear up the matter.

Chairman.—I have not the privilege, either, of cross-examining Sir Frederick, but by to-morrow morning you shall have the figure.

Sir Frederick Hopkinson.—Certainly.

Sir H. Courthope-Munroe.—We have done our best, and we cannot get more than 8*d.*

Sir M. Visvesvaraya.—Will you explain how you arrived at 8*d.*?

Sir H. Courthope-Munroe.—By all means. Sir George is there and he will tell you. It is not my 8*d.* It is his 8*d.* He will tell you how he comes by it.

Sir Frederick Hopkinson (*to the Witness*).—Will you tell us how you arrived at your figure of 8*d.*?

A.—Somebody seems to have abstracted my calculations.

Sir H. Courthope-Munroe.—The only question is, as a matter of fairness, seeing that Sir Frederick has made the allegation of 1*s.* 6*d.*, might not we have his explanation first?

Sir Frederick Hopkinson.—There is no allegation at all?

Chairman.—No, we must clear this up. We will get to the bottom of it. It must be a matter of calculation.

Sir H. Courthope-Munroe.—It must be that some figures want explaining.

Chairman.—Now, Sir George, will you tell us how you arrived at your 8*d.*?

The Witness.—At page 39 of my paper you will see, "Dredging plant, net cost, £54,665, and dredging £23,253, total £77,918. Then, to be quite fair, we have put on £2,600 for engineering expenses and miscellaneous. That comes to £80,518. Looking at page 40 of the same book it says: "The dredger ceased work at the end of August, 1913, having removed 54,584,000 cubic feet." That equals 2,021,000 cubic yards. Putting one into the other the cost per yard comes to 8·72*d.* That is all.

Sir Frederick Hopkinson.—I think your paper also states that 2,000,000 yards of dredging included the amount that had been scoured, and during the course of the discussion afterwards, Mr. Meik said "the quantity of material dredged in the channel in front of the wall did not amount to 1,000,000 tons."

A.—That is a pious opinion of Mr. Meik, but as a matter of fact, whatever was scoured was moved by the dredger.

Q.—It is not so.

A.—However, there are the figures.

Q.—Your paper somewhere says, "Dredged and scoured"?

A.—I am simply going on these figures. "The dredger ceased work, having removed 54,584,000 cubic feet."

Q.—Where is that?

A.—Page 40, "and formed a channel averaging 600 feet wide with depth below low water range from 20 to 40 feet."

Chairman.—It comes to this. If you take dredged and scoured as equivalent to dredged, the price works out at 8·72*d.*?

A.—That is right, yes.

Chairman.—If you accept Mr. Meik's statement as correct, that the quantity dredged did not exceed 1,000,000 tons—is that the figure?

Sir Frederick Hopkinson.—That is not as much as a cubic yard. This costs 1*s.* 6½*d.* a ton. A ton is 20 and a cubic yard is 27, so my 1*s.* 6*d.* is very much below.

Witness.—But I do not accept it as correct. It was a mere pious opinion expressed by Mr. Meik at the meeting.

Chairman.—Wait a moment, Sir George. Mr. Meik was your partner?

A.—Not at that time.

Q.—Had he any special knowledge of this work?

A.—No, no particular knowledge. I was away at the time, and he was present when my paper was read.

Q.—It does come to this—that on your showing, if you accept dredged and scoured as equivalent to dredged, it is 8·72*d.*?—

A.—Yes.

Q.—If one gives weight to Mr. Meik's statement that the dredger did not do more than 1,000,000 tons, then Sir Frederick Hopkinson is right that it works out at rather more than 1*s.* 6½*d.* a ton?

A.—But what was scoured was moved by the dredger. It was caused by the action of the dredger.

Sir Frederick Hopkinson.—Was it not caused by the action of the wall?

A.—No. The dredging was finished before the wall was started. We had moved the dredger. The dredger ceased to work at the end of August, 1913. After that, when the dredger had been removed and the wall was practically finished, then the scour began. But my point is that the reasonable figures to take are those stated in the report.

Chairman.—We see how it stands.

Sir Frederick Hopkinson.—There is a paragraph somewhere in this (I cannot put my finger on it at the moment, but I will look it up later) in which it is said that the 2,000,000 included both dredging and scouring. But supposing we leave it there for a moment, and take your price of 8·72*d.* per ton, or cube yard?

A.—8·72*d.* per cube yard.

Q.—Very well. That was pre-war, was it not?

A.—That was pre-war.

Q.—Your dredging plant at Bombay cost four times as much as the dredging plant pre-war?

A.—Yes.

Q.—Then that 8·72d. goes, does it not?

A.—I do not see the analogy at all. You cannot compare dredging propositions in that way. As I said in my note, which I read before lunch, you can make some comparisons in the case of capital cost and working expenses; but naturally the capital cost of a dredger which removes 10,000,000 tons is very much less than the capital cost of a dredger which only removes 1,000,000 tons.

Q.—That does not touch my point. It is bound to be much more when the capital cost comes to four times as much. Can you get away from that?

A.—I do not see what you are driving at.

Chairman.—May I try to put it? In your estimate of 125 lakhs for the dredging you included the total cost of all the plant which you estimated would be necessary?

A.—Yes.

Q.—That is, you took the probable cost of a dredger, of a booster and of the pipe lines?

A.—Yes.

Q.—You took that, I suppose, as your first item of cost?

A.—Yes.

Q.—Then I suppose you would make a calculation as to the cost of labour for the actual dredging operations?

A.—Yes.

Q.—And the period over which that labour would have to be paid?

A.—Yes, in a measure.

Q.—There may be other items, but anyhow there would be those. What Sir Frederick Hopkinson is putting to you is that if your dredger is going to cost four times the amount in 1919 that it cost in 1912, you at once get a much heavier ultimate dredging cost?

A.—Naturally.

Chairman.—That is the only point which Sir Frederick is putting to you about it.

Sir Frederick Hopkinson.—Two per cent. of 702 lakhs, the project estimate cost, is £105,000 approximately; is it not?

A.—Yes.

Q.—You have disclaimed all responsibility for the construction of the work and for the management of the work. The Committee would like to know what you understand the Bombay Government is paying you that large sum of money for?

A.—I am not prepared to discuss that point. You have got my agreement.

Q.—There must be something?

A.—No, I am not prepared to discuss that point.

Q.—But you must agree that there must be some *quid pro quo*?

A.—I say there is a very adequate *quid pro quo*. However, that is a matter of my agreement, and I think we might leave it at that.

Q.—I have now a few questions to ask you on the general subject of estimates. I should like to point out that on page 16 of your original estimate you give an estimate for the completion of the various areas. No. 1, 354 acres, was to be complete in February, 1923. No. 2, 289 acres, was to be complete in June, 1924. No. 3, 298 acres, was to be complete in May, 1925, and No. 4, 204 acres, was to be complete in December, 1926. That is the total scheme?

A.—Yes.

Q.—December, 1926—that is next month. Up to the present time no single one of those areas is complete, is it?

A.—No, I do not think any one of them is complete.

Q.—And only one of them is really seriously started?

A.—It is so long since I have been at Bombay that I do not know what the situation is.

Chairman.—They tell us they hope to get Block 8 done by May, 1928.

Sir Frederick Hopkinson.—With regard to this file of estimates which you left with me this morning, I cannot see that any of the detailed estimates made here are carried into any summary and allocated to the various works; but I should need probably an hour or two to go through that with you, and I do not think we can spare the time for it now. I think we had better leave it.

Chairman.—Very well.

Sir Frederick Hopkinson.—You say in a letter which you sent us the other day, or in a statement which you made, that it was notorious that prices of labour and materials had soared by leaps and bounds between 1919 and 1922?

A.—Yes.

Q.—I suggest to you that that is not correct—that the major increase in prices occurred before 1919, and that by 1922 the prices were down to the 1916 prices; that when Government control was taken off on April 13th, 1919, prices had a sudden jump then and went up to September, 1920, and then they fell rapidly to May, 1921, when they were down to the 1919 prices, and in 1922 were down to the 1916 prices. You say further that the prices of dredging plant had increased by something like 100 per cent. between 1919 and 1922. Simons' price for dredging plant was £190,000, I think it was. That would have made it £380,000 by 1922; but actually from the prices on which the contract was let the Government got a rebate from Simons?

A.—They did.

Q.—Which shows that prices have fallen?

A.—Yes.

Q.—Since they took the order. I do not quite understand, then, why you should say that the prices of labour and material had soared by leaps and bounds between 1919 and 1922?

A.—It is common knowledge that the price of Indian labour did increase by leaps and bounds from 1919. It was from 1919 that the price of labour did increase. The Special Committee appointed by the Government of Bombay to report on the scheme remarked in their report, dated November, 1925, quite gratuitously, because they would not report in my favour, that the excess was due—that is the excess for the 702 lakhs estimate—to the fact that " since Sir George Buchanan prepared his estimate the prices of working materials, fuel and labour had risen considerably. Also Sir George Buchanan's estimate had been based on exchange at 12 rupees to the £, whereas when the plant was imported in 1921 the rate was in the neighbourhood of 15 rupees to the £. That is the opinion of the special Committee appointed by the Government of Bombay.

Q.—Actually, labour rates in Bombay have never been more than double pre-war rates, have they?

A.—I was not engaging labour in Bombay, but the chief engineer, Mr. Lewis, certainly put it on record in his earlier letters that the way prices were going up, particularly of labour, was astonishing.

Q.—It never more than doubled itself between then and pre-war?

A.—There is the statement of the special Sub-Committee, deliberately appointed, and as I say they were not reporting in my favour. They gratuitously make that statement.

Q.—Do they say between 1919——

A.—They say: "The excess was due to the fact that since Sir George Buchanan prepared his estimate the prices of working materials, fuel and labour had risen considerably. Also Sir George Buchanan's estimate had been based on exchange at 12 rupees to the £, whereas when the plant was imported in 1921 the rate was in the neighbourhood of 15 rupees to the £."

Q.—All plant had been paid for in sterling. Therefore the rate of exchange does not enter into it at all?

A.—It certainly does.

Sir Frederick Hopkinson.—I think that is so, is it not, Mr. Billimoria? All plant has been paid for in sterling from Bombay?

Chairman.—Yes, but if you are paying £480,000 in England and your rupee is worth 1s. 8d., you have to spend far fewer rupees than if your rupee is worth 1s. 4d. That is the point.

Witness.—The point is that when this plant was paid for the rupee was 1s. 4d.

Sir Frederick Hopkinson.—But we have all along been dealing in sterling in all the prices for plant.

Chairman.—That is true, but when Sir George Buchanan puts an estimate of 367 lakhs, he is basing it on the rupee being worth 1s. 8d.

Witness.—Twelve to the £.

Sir Frederick Hopkinson.—Can you tell me off-hand how you made only 1,000,000 cubic yards less filling than Mr. Kidd had?

A.—I cannot tell you off-hand. I thought I had made it more.

Q.—No, a little less—dredged filling?

A.—Mr. Kidd made it 24,000,000 cubic yards and I made it 25,000,000 cubic yards.

Q.—That is right. He made it 24,100,000 and you made it 25,000,000. You made it nearly 1,000,000 more?

A.—Yes.

Q.—Was that a lump sum put on, or was it the result of calculation?

A.—Of course it was not put on. It was the result of calculation.

Q.—But you had no plans to work accurately to. You only had about two cross-sections over four miles of foreshore?

A.—I had all the cross-sections which Mr. Kidd had taken, at all events.

Q.—I think there were only two?

A.—I would not say that.

Q.—You estimate the total cost of the staff and supervision at 17.98 lakhs. Call it 18 lakhs. Actually it is costing 6¼ lakhs a year, so your estimate is only half the supervision?

A.—But, Sir Frederick Hopkinson, it is "Engineering charges, including all establishments, 17.98 lakhs." That does not include the whole of the establishments carrying out the works.

Q.—I quite understand that, but that is the establishment charge. You take the same basis of establishment as they take in Bombay. It only includes the superior establishment charges?

A.—It is "Engineering charges including all establishments." That means——

Q.—What it says, I take it?

A.—Yes.

Q.—Establishment charges are well understood?

A.—What do you say the establishment charges actually are?

Q.—They are double what you have allowed. They are 6¼ lakhs a year, and you took 18 lakhs for five years?

A.—Yes, and their 6¼ lakhs includes the establishment on the Khandivli Quarry.

Q.—Of course. That is part of the works, is it not?

A.—Not included in this estimate—not in the engineer's estimate. These are all included in the prices. No engineer's estimate includes under "establishment" prices of that kind.

Q.—Can you show me in any of these figures where you have got establishment charges charged to the Khandivli Quarry?

A.—No. Why should I?

Q.—I am sure you cannot. Can you show where it is allowed for in the prices?—

A.—We are discussing the matter from different points of view. You are discussing it from the point of view of a contractor making up a tender, and I am discussing it from the ordinary point of an engineer's estimate.

Q.—What do you include in it?

A.—That is an ordinary engineer's estimate at so much a cubic yard and so much a cubic foot.

Q.—But what is your establishment?

A.—I do not deal with establishment. It is "Engineering charges including all establishments."

Q.—"Including all establishments." What does it include?

A.—That includes the resident engineer and his office, and all our fees.

Q.—Does it not include all the other engineers?

A.—No.

Mr. Billimoria.—May I point out that this is a round figure of 5 per cent. added on? There is no calculation about it.

Sir Frederick Hopkinson.—No calculation at all.

Mr. Billimoria.—It is only a 5 per cent. addition.

Witness.—Very well; that is usual.

Chairman.—I confess I do not quite understand this point. Will you continue, Sir George? Sir Frederick Hopkinson has asked you what it includes. You say it includes your own fees and your own establishment?

A.—It includes presumably the resident engineer and his office.

Q.—It includes the resident engineer, the cost of the resident engineer's office; anything else?

A.—Yes, I suppose it would include the deputy-resident engineer. I cannot think of anything else.

Sir Frederick Hopkinson.—But surely the two engineers would not come to as much as 2 per cent—your fees. Does it not include the constructional engineers?

A.—No.

Q.—Surely they are establishment. Does it include the clerks? Are not they establishment?

A.—"Engineering charges including all establishments, 5 per cent." That is a usual figure to put on to estimates, as you know. If you want to know whether I worked out a detailed establishment for the whole of these works, certainly I did not. It was not my business to do so.

Q.—I am pointing out that your estimate is less than half what it costs.

A.—And I am pointing out that the whole of the establishments, if it had been let by contract, would be contractors' charges.

Chairman.—I may point out that Sir Frederick Hopkinson has been reading from Page 29. A reference to Page 13, item No. 5, Table B., shows that you altered the phrasing of it a little. "Engineering and management inclusive of establishment and all other charges." Does not that mean all the necessary cost of establishment?

A.—No, it does not include all the clerks for the contractors' part of the work.

Sir Frederick Hopkinson.—Where is that included?

A.—It is included in the figures.

Mr. Billimoria.—If you look at Page 30 you will find "Wages, stores and fuel" only are provided for in those other working costs—nothing more. None of the management expenses or overhead charges are there.

Sir Frederick Hopkinson.—Wages, stores and fuel. The rest is all supervision and establishment.

Mr. Billimoria.—That is so.

Sir Frederick Hopkinson.—I do not think I can carry that any further, but I would like to call your attention to an interesting little calculation. If you take Mr. Kidd's estimate, deduct the roads and drains, and add on 10 per cent., you get almost exactly your estimate of 1919, minus roads. In one case it is 292·36 lakhs, and in the other case it is 292·61 lakhs—almost identical figures?

A.—Yes. I do not see what is the inference.

Q.—I am pointing out an interesting fact.

A.—I do not see what the analogy is.

Q.—I am going to draw your attention to various things in connection with the estimates. Take the muram topping, for instance, in 1919. You said it was going to be 1,830,000 cubic yards. In February, 1922, you said it was going to be 3,660,000 yards—doubled?

A.—Yes.

Q.—Why is that?

A.—In February, 1922, did you say?

Q.—February 11th, 1922?

A.—Is that in a letter?

Q.—Yes, Page 63, the middle paragraph?

A.—I cannot see it.

Q.—" Referring to the revised estimate accompanying Sir George Buchanan's report dated 11th February, 1922, we find that the quantity of muram allowed therein is 100,000,000 cubic feet." That is double what was in the previous estimate?

A.—Yes, but there is nothing peculiar about that. As a matter of fact that estimate was not accepted, so why argue about it.

Sir Frederick Hopkinson.—I am pointing out to you the disparity in these various estimates. I have got a lot more points to put to you.

Mr. Billimoria.—A higher estimate than that was accepted. The 702 lakhs estimate was accepted. This is only 598 lakhs.

Sir Frederick Hopkinson.—I am going to suggest to you later on that the word " estimate " has been very grossly misused?

A.—I resent that suggestion.

Chairman.—I would like to know how it is that in February, 1922, you are suggesting twice the amount of moorum that you put forward as necessary in 1919? What was the reason?

A.—The reason was that Sir Lawless Hepper, as I told you the other day, asked me to put on to that estimate of mine 100 lakhs and divide it amongst the equipment of the area and the moorum filling, because he did not think we had got sufficient.

Q.—I wonder if you have got to hand that document, because I would like to see whether there was any contemporary alteration. Do you remember there was an alteration where you wrote the words in pencil, " storm water and sewerage "? You remember that?

A.—Yes. I have not got that with me. I will let you have it.

Q.—Again, I do not follow that. Did you consider that it was necessary to load your February, 1922, estimate by doubling the amount of moorum, or not?

A.—It was discussed.

Q.—Did you agree that it ought to be done?

A.—I did not think there was any particular objection to it. It had been put into the project estimate. In any case, nothing was done with this particular estimate, so why discuss an estimate which, in reality, was put into the waste paper basket?

Q.—The value of it is that it has your signature to it as an estimate revised and approved by you. That is the importance of it. If, of course, you did not believe that the moorum topping would cost 60 lakhs, but that it would only cost 30 lakhs, you would not have put it into your revised estimate. The question is, what was the reason?

A.—There was no objection to putting it into the estimate. They wanted a big estimate. There was no objection. We did not know exactly how much moorum we were going to put in. Sir Lawless Hepper said, " Better have a large sum than a small sum." We do not know now how much moorum is going to be used.

Q.—In point of fact, really, the extra amount of moorum was the difference between 1 ft. and 2 ft., was it not?

A.—Yes.

Mr. Billimoria.—May I point out that, out of the 100 lakhs which Sir George has been mentioning, 85 lakhs consist of only two items—roads, lights, storm water drains, etc., 60 lakhs, and 25 lakhs for contingencies, leaving only 15 lakhs to be apportioned among the other items. So that could not be with regard to moorum topping at all?

A.—Well, it was.

Mr. Billimoria.—85 lakhs are covered by only two items—25 lakhs for contingencies, and 60 lakhs for storm water drains. That leaves a figure of 15 lakhs to be accounted for, which, if spread over all the remaining items, 1 to 10, could not have gone into one item alone of moorum topping?

Sir Frederick Hopkinson.—Which all points to my remark about the misuse of the word " estimate."

Witness.—I resent that suggestion. I say that at the time these estimates were prepared they were the ordinary engineers estimates. I am willing to submit these estimates to an investigation by any impartial tribunal of Westminster engineers—absolutely willing.

Sir Frederick Hopkinson.—I should just like to run through the difference between Mr. Kidd's estimates and yours. With regard to Back Bay, Mr. Kidd says it is full of rocks and pockets, and impossible to get material for reclamation. You say the same. Incidentally, both of you appear to have been wrong.

A.—Why?

Q.—Because Mr. Lewis says you can get 25,000,000 yards from Back Bay, and they are getting it at the present moment.

A.—They are not getting 25,000,000 yards.

Q.—They are dredging at the present moment——

A.—I have no knowledge of what they are doing at present.

Q.—I will tell you then. The area is the same in each case; the line of wall is the same; the dredged material is the same; the dredging plant, 2,000 cube yards an hour, is the same, except that Mr. Kidd provided 7,500 H.P. and you provided 3,000 H.P.

A.—I beg your pardon. That 7,500 H.P. of Mr. Kidd's has not been verified.

Chairman.—We are making inquiries about that.

A.—It has not been verified yet.

Sir Frederick Hopkinson.—Make any deductions from what you like, you will find that you may possibly get it down to 6,000.

A.—It is no good making any guesses until you have the figures.

Q.—We know the horse-power of the winches, and we know the horse-power of the propelling engines, and we know the ordinary service pumps in the boat. Dredging plant, 2,000 cubic yards an hour, is the same; the booster was the same and the quantities were the same. Sea wall, the rubble bank is slightly different. Mr. Kidd provided for 25-ton concrete blocks; you provided for 20-ton blocks. Again, incidentally, neither of those were required. A foot of moorum topping is the same in both cases. Mr. Kidd provided seven pipelines and you provided five. The storm drains were omitted by Mr. Kidd, and were also omitted by you.

A.—I beg your pardon.

Chairman.—I do not think you agree to that?

A.—I do not agree to that for a moment.

Sir Frederick Hopkinson.—Now the estimate details. Mr. Kidd had six items; you had seven items. Otherwise your estimates are the same. Mr. Kidd gave his estimate of plant and temporary works at £500,000. Yours have cost two and a half times—which shows that we are not very far out in taking two and a half as the difference between pre-war and post-war costs. Mr. Kidd says his is a safe estimate. You say your prices are reasonable and reliable and you never over-estimate?

A.—Yes.

Q.—There is very little difference between Mr. Kidd's project and yours?

A.—Except that I maintain that Mr. Kidd had over-estimated his dredging.

Q.—It appears that you under-estimated it—that, under the most favourable circumstances, it is costing over a rupee a cube yard. Against his cost of 9 annas, which would probably have been just about right, and yours of 8 annas, it is costing over 16 annas?

A.—I have given you a lot of examples to-day of dredging costs at 2 annas. Supposing you put on another 2 annas, that is 4 annas, and you get charged nearly 7 annas as this dredging cost?

Q.—I do not accept those instances which you have given us to-day. They are all instances of single-dredger working. You have two dredgers working on the same pipeline. Therefore your costs must be doubled?

A.—You can double Mr. Kidd's, and still have a margin of 2 or 3 annas.

Q.—I do not follow that. We do know that Sir Sydney Crookshank considered Mr. Kidd's a very careful and ably prepared project, and he did not attach any value to your comparative estimate of 241·9 lakhs.

A.—And the Chairman has pointed out that Sir Sydney Crookshank had had no experience of that kind of work, and therefore any opinion of his was not reliable.

Q.—Again, on the subject of estimates, the project estimate of the value of the plant was 67 lakhs—£502,000. Your estimate was 10 lakhs—£75,000, a difference of £427,000?

A.—I do not quite see where that is.

Q.—I will tell you again. The project estimate of the value of the plant is 67 lakhs.

A.—Of all plant, or dredging plant only?

Q.—All plant, I presume. That is £502,000. Yours was 10 lakhs, £75,000—a difference of £427,000.

A.—You mean dredging plant, or all plant?

Q.—I mean all plant—the credit which the work was going to get when they had finished, and sold the plant?

A.—I did not buy the plant. My point is that I had no responsibility for any expenditure on the works.

Q.—You do not see my point. I am trying to point out how this poor word " estimate " has been misused. Here is one engineer, in 1922, saying it is going to be worth £502,000, and you consider it is only going to be worth £75,000. That is the sale price at the conclusion. I want you to look at this from the point of view of the Government of Bombay?

A.—You mean allowing for the value of the plant on the completion of the work?

Q.—Yes. You put 10 lakhs, and Mr. Lewis put 67 lakhs for the value—realisation value.

Chairman.—He was very optimistic.

A.—It has nothing to do with me.

Chairman.—No.

Sir Frederick Hopkinson.—I am contrasting the two. I am sitting here in the position of the Government of Bombay for the moment and trying to realise how I should have been bewildered when I received such so-called estimates.

Chairman.—You came to the conclusion that, at the end of the work, the greater part of the material would be sold at scrap rate, and therefore you put it at 10 lakhs?

A.—Yes.

Q.—Mr. Lewis, for some reason that is not very clear, thought that, at the end of the work, the plant would be worth 67 lakhs?

A.—Yes.

Sir Frederick Hopkinson.—I should just like to put in a tabulated form, so that it can be seen when the Report is considered, the various estimates. Mr. Kidd's in 1912 was 325·23 lakhs. Sir George Buchanan's in 1919 was 367·61 lakhs. Sir George Buchanan's in Februray, 1922, was 598·89 lakhs. As it was submitted this was 498, but an extra crore was put on it for some reason.

A.—At the request of the Director of Development.

Q.—Then the project estimate of April, 1922, is 702·43 lakhs, and then in July, 1924, as a result of the decision to dredge Back Bay, Mr. Lewis made it 726·54. Mr. Elgee made a revised estimate in January, 1925, of 712·79. Mr. O'Rourke, for the Advisory Committee, and based on dredging results of 1924-25, made an estimate of 1,109·43. Mr. Elgee's present estimate is 1,000 lakhs. And there has been no essential alteration in the scheme from 1912 to the present day?

A.—Quite true.

Q.—Now I will just finish the roads. Mr. Kidd, in 1912, said the roads, drains, etc., were going to cost 59·45 lakhs. Sir George Buchanan, in 1919, said they were going to cost 75 lakhs. Sir George Buchanan, in February, 1922, said they were going to cost 135 lakhs, and Mr. Lewis, in May, 1922, said they were going to cost 211·90 lakhs?

A.—That sounds very——

Q.—Awful, does it not?

A.—No. Take that last subject of roads. You must remember that there was 136 lakhs equipment of the reclaimed area which had nothing to do with the 367 lakh estimate or had nothing to do with Mr. Kidd's estimate.

Q.—Yes, it is all in?

A.—Oh dear no.

Q.—Yes, it is.

Mr. Billimoria.—At page 13, if you refer to the report, the figure is there—59 lakhs.

A.—Fifty-nine lakhs was not to include the equipment of the whole of the reclaimed area, because no one knew how it was going to be equipped.

Sir Frederick Hopkinson.—What do you mean by all the equipment?

A.—Roads and sewerage works.

Sir Frederick Hopkinson.—It specifically says " roads."

Chairman.—Are not you rather in a difficulty over this in making that statement—because you never saw the Public Works Department estimate?

A.—No, I never saw the Public Works Department estimate.

Q.—You did not know what it contained?
A.—No, I did not know what it contained.

Q.—Therefore, not knowing its contents, why should you say so positively that the roads, lighting, and drains of the Public Works Department, 59·45 lakhs, did not include the lay-out?
A.—I cannot say, because I never saw the estimates.

Q.—In fact, you arrived at your figure of 75 by putting on a percentage?
A.—Yes.

Sir Frederick Hopkinson.—Once more referring to Mr. Kidd's details, if you look through his papers you will find that he gives rates for all sorts of people—the Chief Superintendent, Superintending Engineer, the Dredging Master, laddermen, Chief Surveyor, second engineers, engine-drivers, and so on. You gave none of that information?

A.—No, I would not expect to give it. No engineer would expect to give it. But I do give what Mr. Kidd does not give. I give the quantities of cubic yards of concrete and facing and tipped rubble, and so on.

Q.—I mentioned that. You split it into six items, and he gives it in one—lineal measurement. I should like to call your attention to the fact that the prices which the Directorate have recently been paying for all these men I have been speaking of—superintending engineers, and so on—are just about two-and-a-half to three times the price that is contained in Mr. Kidd's schedule, which again confirms our two-and-a-half. I should also like to get it on the notes as an interesting comparison between 1912 and 1920, that ship plates in 1912 were £8 10s. a ton and £24 10s. a ton in 1920, when the dredger was purchased.

Sir H. Courthope-Munroe.—Do you accept that, Sir George?
A.—I do not know.

Chairman.—The Director-General of Stores has proved that from official documents which he has put forward. It is all on a table here.

Mr. Billimoria.—Sir George, I am afraid I shall have to make some preliminary remarks before I ask you a few questions. You will appreciate that this is an Enquiry Committee, and if some of the questions appear on the surface to be unpleasant, you need not necessarily assume that these are intended to offend or annoy you. What I want are the facts and the truth, and we are particularly anxious that you should be good enough to help this Committee by enlightening us on the true state of affairs, as you may be able to do so, to the best of your ability and knowledge.

Chairman.—I think Sir George has been very helpful to us.

Mr. Billimoria.—I do not deny that. I have to make these observations so that there may not be any prejudice, or that any of my questions may not be misconstrued. What I want are the facts, and I shall be obliged if you will be good enough to tell us exactly what you know of the situation. Most of the ground has already been covered by our Chairman and my other colleagues who have preceded me, and therefore I shall confine myself to asking you a few questions with a view to eliciting a few further facts. I am very glad to observe that you have the benefit of being assisted by three legal luminaries of the British Bar. The Committee welcome those eminent lawyers here, but I find that it has not gone on our records, or at least on the evidence, as to the circumstances under which you were extended this special indulgence of appearing by counsel. I have to mention this, because when our Report is written and submitted to the people in Bombay, it is quite likely that questions may be asked in the Legislative Council, and in other public places, as to why this special concession was made in your case. I understand from certain statements that have been made by your eminent learned counsel, Sir Harry Courthope-Munroe, that you do not want to take up the attitude of being on trial or on your defence. May I therefore ask you whether you had any feeling that the public mind, being seriously agitated, and the scheme being likely to prove to be a financial failure of serious dimensions as the result of relying on your advice, you thought it advisable to engage counsel and lawyers to defend you?
A.—I can reply to that question, Mr. Billimoria.

Q.—If you please?
A.—No such idea entered my mind, but such extraordinary statements had been made in the course of the Enquiry in Bombay that I thought it would be advisable for me to have the assistance of the legal luminaries whom you have mentioned.

Q.—I very much appreciate that.
A.—That is the reason.

Q.—It clears the atmosphere to a very great extent, because you can understand that, when we get back, in certain political quarters questions may be asked as to why we showed special indulgence to you.

A.—Well, that is the reason.

Q.—Will you kindly turn to the book of correspondence, page 160, paragraph 2 of the letter written by Mr. R. J. Bell, Secretary to the Government of Bombay in the Development Department. It is dated 28th August, 1925. The Government of Bombay through their Secretary state as follows: " I am desired to emphasise the very unsatisfactory nature of these figures and to state that Government view with great dissatisfaction the slow progress of the work, which threatens most seriously to prejudice the financial prospects of the scheme. Government undertook the reclamation on the recommendation of Sir George Buchanan contained in his report of September, 1919." Have you any remarks to offer on the observations of the Government of Bombay as contained in paragraph 2 of this letter?

A.—Yes. I have given the reply several times.

Q.—Then, as you will observe, they go further and say: " The work cannot be completed until the year 1943, and the cost, excluding interest charges, will amount to 11 crores "?

A.—I do not accept that estimate.

Q.—Then in paragraph 3 they say: " So far, therefore, the matter of reclamation by suction dredging has proved a failure "; and in paragraph 5 they say: " In the circumstances I am to say that the Government call on you as the engineers for the scheme to take necessary steps without delay." I shall be very much obliged if you will kindly state what you have to say with regard to the observations made by the Government of Bombay as contained in the letter of the 20th August, 1925?

A.—I can only repeat what I have said before—that I do not think the dredgers have had a fair trial. I am only repeating what I have said several times, and you will excuse me repeating it once again. I would reserve an opinion until the work has been taken out of Government control.

Q.—By your suggestion of " a fair trial, do you mean in the year 1926? We are now at the close of the year 1926, when you expected the whole scheme to be completed?

A.—I say that the sooner the works are taken out of Government control and put into the hands of business people the better. In fact I will quote again what I said in my statement. " The creation of the Development Department and Directorate I consider, in the light of events, to have been a mistake. The Governor of Bombay (now Lord Lloyd) hoped that he would institute a new department with fresh blood, freed from the restrictions and red tape of other departments, but when he disappeared from the scene and with him the only driving force in Bombay, the Development Directorate degenerated to an ordinary Government Department slavishly following other departments and hide-bound by rules, regulations and restrictions. It was a Public Works Department being carried out on exactly similar lines to the recognised P.W.D. and subjected to precisely the same rules and regulations, but without its experience."

Q.—That is the explanation you offer with regard to the observations of the Government of Bombay. Now will you turn to Page 164, Paragraph 2, letter written by Sir Lawless Hepper to you dated 24th September, 1925, in which he says " It seems inevitable that Government will be faced with a very heavy loss." I am particularly bringing this paragraph to your notice because in the note which you have submitted you say that this is going to be a brilliant success. The Government of Bombay feel otherwise, and the people of Bombay feel very sore about it, because they know it is going to result in a very heavy loss. Paragraph 3 says: " The work will cost about 11 crores and will not be finished until about 1944-45."

A.—Those are all wild estimates. The estimate of 11 crores was a wild estimate.

Chairman.—You do not disagree with it if it continues in the same control, do you?

A.—No, not if it continues in the same control; I think it might go up to—well, I would not like to say how much.

Q.—In one of your letters you said the scheme, if worked at the rate at which it has been going on, would take 35 years?

A.—I did. I notice that some people have taken that seriously but as a matter of fact we tried a little sarcasm.

Mr. Billimoria.—May I now ask you to direct your attention to Page 175 of the book of correspondence, Paragraph 2. I will read one sentence only: " The data adopted by Sir George Buchanan in his report upon which he founded his estimates have been found to be unreliable." " These estimates, both as to time and cost will be exceeded beyond all reasonable allowance, and the item of dredging has been specially unsatisfactory." I suppose you make the same observations, do you?

A.—I do, certainly. I agree.

Q.—You do not agree with the Government of Bombay with regard to anything which they have stated in those various letter addressed to you?

A.—No. I think it would be better if they put their house in order.

Q.—Now will you kindly turn to page 129, which is a letter written by yourself to the chief engineer of the Reclamation Branch, dated 23rd July. In paragraph 2 you say that at the present rate of progress the reclamation will be completed in 35 years. In the light of what has happened do you at all doubt that this scheme will take 35 years to complete—knowing what has gone on in the past and how things have moved? Have you any doubts about it?

A.—It is difficult to express an opinion about 35 years.

Q.—That is your statement, Sir George?

A.—I was sarcastic. This statement about 35 years was written in a sarcastic mood.

Q.—In a sober moment how many years would you say it would take to complete the scheme?

A.—We hoped to arouse them by talking about 35 years.

Q.—Supposing they were in a very good slumber, how many years do you think it would take to rouse them?

A.—I think they ought to be aroused at once.

Q.—Talking seriously about it, Sir George, how long do you think it would take to complete the whole scheme? I am asking you because we have to recommend whether the scheme should be completed *in toto* or partially. Supposing this Committee decides that the scheme has to be completed, may we have the benefit of your advice as to how many years you calculate it would take for the whole scheme to be completed, taking into account the manner in which the work is at present going on, or alternatively with the necessary improvements which you no doubt could suggest?

A.—I am very sorry, Mr. Billimoria, but it would not be possible for me to give that information. It would really require a deliberate and considered investigation, and as I have no further connection at present with the scheme, I could hardly do such a thing. Your honourable colleague, Sir M. Visvesvaraya asked me more or less a similar question, and I then suggested, what I have suggested before—taking it out of the hands of Government and letting it out to contracts.

Q.—Seriously, how long do you think it would take?

A.—I should be very sorry to express an opinion.

Q.—I am very much disappointed at that answer, because the people of Bombay were looking forward to your advice and co-operation in this matter?

A.—I should be delighted to give you an opinion if I could, but you must remember that Sir Lawless Hepper thought the best thing he could do towards putting things right was to send me away, and he is now carrying on by himself. Sir Lawless Hepper said in his evidence that Government thought they had better leave him in entire charge. I should very much like to help you, but I have not got the information.

Q.—Very well then, we shall have to leave it at that. May I ask you one question with regard to your remuneration. You were paid a special remuneration for preparing and drawing up your report and estimate, and subsequently an agreement was entered into between yourself and the Secretary of State by which you were to be paid a commission of 2 per cent. on the total expenditure of the works?

A.—Yes, and which I may say we have not received.

Q.—You have stated you have received a substantial portion thereof. I take it that by now you have received something like six lakhs, or roughly about £50,000?

A.—I will take any figure like that, and I would again say what I stated the other day—and in regard to which Sir Frederick Hopkinson for once in his life entirely agreed with me—that when Income Tax and Super Tax and various other taxes and expenses had been taken off, there was not such a large sum left as one might imagine.

Q.—I appreciate that, but I suppose when you undertook the job you calculated all that; you foresaw it?

A.—Yes.

Q.—Every professional man, including myself, has always to look ahead in matters of that sort, so you cannot make any complaint about that?

A.—I do not make any complaints at all, only people have seemed to think it was a large sum of which we have had the entire spending.

Q.—I am raising the question because at Page 63 of your note you seem to be worrying about it. You say " We employed a permanent staff in our office whose time was chiefly devoted to the Back Bay reclamation scheme," and then you proceed to say that in many cases it has not paid your expenses. When the job was undertaken by you, I take it that you had anticipated what your expenses were going to be. You contemplated what staff you were going to employ—necessarily an expert staff because this

was of very vast magnitude. Therefore reading your Paragraph 80, I was a little surprised to find you making a grievance of the fact that the remuneration has not been sufficient to pay you your expenses?

A.—If you will allow me to say so, I should be very sorry if you took that as being a complaint.

Q.—I came to that conclusion on reading it?

A.—It is not a complaint at all; It is simply a statement of facts. There is no complaint at all.

Q.—When you undertook this job it was on the basis of an estimate of three crores and 67 lakhs. That estimate, according to your own report, was based upon substantially reliable data, and you said you never over-estimated an estimate.

A.—Yes.

Q.—Evidently, therefore, when this job was undertaken by you, you calculated that your gross commission was going to amount to about 6 or 7 lakhs—taking 1 per cent. on the dredgers?

A.—Yes.

Q.—You have practically been paid that remuneration, although not even 25 per cent. of the work has been done. Therefore, if this is in the nature of a complaint, I say the complaint is hardly justified, because you have been already paid the full amount of the remuneration which you originally anticipated, although not even 25 per cent. of the work has been done?

A.—As I said before you made your last remark, it is not a complaint.

Chairman.—I do not read it in any sense as a complaint. It is a statement of fact that, in fact, although you got the large sum of £45,000, against it you have to set off large numbers of expenses, journeys to India of yourself and other people, and in the result in some instances it has not proved remunerative. It is not a complaint at all.

Mr. Billimoria.—I am very glad to hear you do not make any grievance or complaint about it, but the people in Bombay will make serious complaint of it, because you have already been paid a sum of 6 lakhs for work which they anticipated you to complete for that remuneration, and they do not see anything approaching 25 per cent. of that work. That means they have to pay four times over if the scheme is to be completed. That is their grievance. Supposing, Sir George, when you submitted your report and estimate to Government, some officer in the department, either in the Public Works or in the Secretariat, had suggested that before any administrative sanction could be obtained it was desired to consider carefully your report, you would most willingly have given that officer all the information in your possession, I take it—if he wanted information or assistance from you?

A.—You mean, for example, Sir Sydney Crookshank?

Q.—Yes.

A.—Certainly. It would be my duty to give that information.

Q.—You would place before him all the necessary materials and data upon which you arrived at your various conclusions, without the slightest hesitation?

A.—Without the slightest hesitation.

Q.—You would have been very pleased to have discussed any points arising out of your report and out of these details?

A.—Yes.

Q.—I am very glad you admit it, because I find that your learned Counsel the other day raised the objection that we were not entitled to the details. Therefore your last few answers dispose of that objection. You say that any officer of Government had the right to demand from you particulars, and that you would very willingly have furnished them. Therefore this Committee is entitled to ask for those details from you, acting, as it now is, in the spirit of an Enquiry to gather all these details from you?

A.—Do not misunderstand me. I should be very sorry for you to think that I was not anxious to furnish everything to this Committee. This particular case raises a little bit of professional etiquette. An engineer does not usually publish all his calculations, and so on. It was not with any idea of keeping anything from you.

Mr. Billimoria.—I am very glad to hear that, because there was a passage at arms between myself and your Counsel when, on one day, he got up and said that the newspapers had reported something of mine to which he took exception.

Sir H. Courthorpe-Munroe.—I did not desire to cross swords with you. I think I made my position in the matter clear to the Committee.

Mr. Billimoria.—Your visits to Bombay in different years, Sir George, were not exclusively in connection with the reclamation work. Along with your visits to Bombay there were other visits to Baroda and other places in India and elsewhere. Therefore

you cannot say that all your visits were simply in connection with the reclamation scheme at Bombay?

A.—Not absolutely. The Secretary has the list of my visits.

Q.—He has, and from that list I find that you very often went to Baroda, and you enjoyed your Christmas holidays in Calcutta, and you had many other pleasant trips all over India?

A.—That is a very nice way of putting it.

Q.—So that the time you spent in connection with your various visits to India was not exclusively devoted to the reclamation work?

A.—No.

Q.—I will now direct your attention to the letter written by H.E. Lord Lloyd on the 25th May, 1919, and request you to turn to Page 29 of your statement. You remember the letter which was read out to you by the Chairman?

A.—Yes.

Q.—In Paragraph 34 you say : " If I said the scheme was impracticable he would turn it down at once and start on something fresh, but once my opinion was given he would refuse to allow any other expert to report, and he asked me not to let him down ". This is in reference to an interview between yourself and the Governor of Bombay?

A.—Yes.

Q.—At the interview Lord Lloyd asked you not to let him down?

A.—Yes.

Q.—You have been good enough to explain to the Chairman what that means. What I want to get from you is this—that Lord Lloyd depended entirely upon your skill and ability to carry out the project, and had very great confidence in you?

A.—Yes, and I think he still has that confidence—at least I hope so.

Q.—I am very glad to hear that. He said so when he was giving evidence here. If you remember, that letter speaks of the financial aspects besides the engineering aspects; and you will agree with me that all engineering propositions are very closely linked up with finance?

A.—Yes.

Q.—Some schemes may appear very glorious on paper from an engineering point of view, but from the financial point of view they may not be so promising. If they are not promising or financially sound, there would be considerable hesitation before embarking on such schemes or projects?

A.—I absolutely agree with you.

Q.—Your report of 1919, and the estimates, were the foundation for giving birth to the present reclamation scheme?

A.—Yes.

Q.—The whole scheme is based on that report of yours of September, 1919?

A.—Yes.

Q.—If those estimates had been exceeded in a measure so as to make the scheme a financial failure, as pointed out by the Government of Bombay, it would mean that you have let down the Government. Do you agree with that?

A.—No, I would not agree that I had let down the Government at all.

Q.—The scheme was launched on the basis of your 367 lakh figure. If that estimate is three times as much now, would not you call it letting down your employer?

A.—No. If you ask me whether I have let down Lord Lloyd, I say no I have not, and some day, I hope, when this is all over, he will express his opinion upon the matter. You know as well as I do of the extraordinary optimism there was in Bombay. Even when the 702 lakh estimate was sanctioned they expected to get 369 lakhs of rupees profit.

Q.—Circumstances have altered since then?

A.—Circumstances have altered since then.

Q.—What I am driving at is this—that Lord Lloyd had implicit confidence in you?

A.—Yes.

Q.—He said he would not go and consult any other civil engineer but would rely on you absolutely. The whole scheme was launched, recommended and approved by the Government of India and the Secretary of State on the basis of the figure of 367 lakhs?

A.—Yes.

Q.—Now that that figure is three times as much do not you think it is letting down the Government?

A.—No. If you could prove that I was entirely responsible for the figure increasing to the extent that it has, it would be a very grave error of judgment on my part, but I

would like to try to make you believe that this plan and these estimates were made in good faith, with all the knowledge that I could get on the subject; and I still say that they were reliable in 1919. As I have said this afternoon, I am perfectly willing to let a board of impartial Westminister engineers express an opinion on that report and on those estimates.

Q.—You will agree with me that in the light of events that have transpired, this was rather a hurried report; that you did not give it as much thought and consideration as you might have done under normal conditions?

A.—Mr. Billimoria, I should like to agree with you, but I cannot accept that. I consider I gave it all the care, consideration and time that was wanted. If I may make an analogy, probably you are very quick indeed at making an audit. Supposing you make an audit and you take half the time which a less skilled professional man would take, you would not say that you had made an inaccurate audit:

Q.—True, but if I had overlooked something very material, I should be hauled up in a Court of Law by the Learned Counsel who is appearing for you, and I should be sent to penal servitude for seven years if I let down the shareholders of the Company.

A.—I consider that I remained long enough in Bombay to get all the information that I wanted. Then I went home and spent the whole time I was at home considering this report, along with a very skilled engineer indeed—the late Mr. Meik, an engineer quoted by the Government of Bombay as being in the very first rank of harbour engineers. It was five or six months between the time I took on this work and the time before it was finished.

Q.—Do you think your ten days' stay in Bombay was sufficient to gather all the information necessary for a scheme of this vast magnitude—perhaps the biggest in the world?

A.—Honestly I do, Mr. Billimoria.

Q.—Ten days was sufficient for you to gather all the data and information?

A.—It would not have been if I had been doing it as a contractor, but I was not. I was not doing it as a contractor would have done it. I had not to go and work out all the details on the spot of constructing the quarry. This was not a detailed report. This was a report upon Mr. Kidd's report. This was in no sense a working document. This was not a document with which you could have gone to a contractor and said: "Will you take the work on this?" In fact in the correspondence I have stated that the first thing to do after the administrative sanction to the scheme was passed was to get out the detailed working plans and estimates.

Q.—Your responsibility with regard to that report was very much greater than that of a contractor, Sir George, because it was on the basis of your report that the Government embarked on the scheme. Had you stated something otherwise in your report—had you expressed the slightest doubt that the scheme was not feasible, or that it was not financially sound, Lord Lloyd, as stated in his letter, would have directed his attention to something more serious, and would have abandoned the scheme altogether. So that there was a greater responsibility on your shoulders than there would have been on the shoulders of a contractor, who would simply have burned his fingers if he had gone on that estimate.

A.—If you will excuse me, it was no business of mine to report on the financial prospects of the scheme.

Mr. Billimoria.—The letter indicates that, "both financially and otherwise," as to whether it is a sound proposition.

Chairman.—The letter says "on the present prevailing prices."

Mr. Billimoria.—If it is on the present prevailing prices that indicates the same thing.

A.—I do not follow you.

Chairman.—In Lord Lloyd's letter of 23rd May he put before you two things. He wanted to be advised as to the feasibility of the scheme and whether, in view of the greatly enhanced prices of dredgers, the plan was a workable one.

A.—I understand exactly; but I understood Mr. Billimoria was suggesting that I should have assisted in discussing the ultimate financial success of the scheme.

Chairman.—Lord Lloyd never put that to you.

Mr. Billimoria.—Not the ultimate success; but in any scheme that is launched, if the cost is so much and the Government contemplated if they were going to get a return of so much it would be a financial success, then financial considerations come in?

A.—Yes.

Q.—If your report had stated 702 lakhs, and the Government contemplated it was not possible to recoup 702 lakhs, they would have given up the scheme as a financial failure. That is where the financial aspect comes in.

A.—In point of fact, would they?

Sir Frederick Hopkinson.—You mean that the ultimate result is affected by the cost?

Mr. Billimoria.—It must be so.

Chairman.—Mr. Billimoria's point is even shorter than that. He say, if Sir George Buchanan had stated at the outset 702 lakhs for the cost of the execution of the work, the Government might possibly have turned it down. Sir George Buchanan says: would they, in the prevailing spirit of optimism?

Mr. Billimoria.—If you will kindly return to your own report, you find that the Government of India was very, very cautious. They said: "Nobody had previous experience of reclamation on an open sea front."

A.—The Government of India were certainly very cautious, indeed.

Mr. Billimoria.—They would not have listened to anything at a figure of 702 lakhs. It is most unfortunate that things have turned out otherwise, but if Sir George's figure had been 702 lakhs there are grave doubts whether the Government of India and the Secretary of State would ever have sanctioned the scheme.

Chairman.—We must be a little careful about that because Sir Sydney Crookshank, when the point was put to him, said: "I am not at all prepared to say that I would have turned it down."

Mr. Billimoria.—I will put it in a different way. Leaving out the dredging proposition, if it had been an ordinary moorum filling proposition it would have cost 702 lakhs. If it was an ordinary dry filling proposition, and not wet filling, according to my learned colleague's figures it would have cost 702 lakhs, or perhaps a little less.

A.—I can hardly express an opinion about that.

Mr. Billimoria.—My friend has worked out the figures, and that is what he tells me.

Sir M. Visvesvaraya.—I think both of us are agreed as to that.

Mr. Billimoria.—So that the Government of India could never have entertained the proposal of dry filling at a cost of 702 lakhs. That is one of the reasons why I say the Government would have turned it down.

A.—Yes.

Q.—You know the area to be reclaimed is 1,145 acres?

A.—Yes.

Q.—Out of that only 22 lakhs of square yards of land were to be made available for building sites after providing for roads and open spaces?

A.—Yes.

Q.—If you will kindly turn to your statement at page 16, you will find there is a forecast in the middle of the page: "The Bombay Government anticipate carrying out the work in eight years, and the forecast is based upon that assumption and the leasing out of an area of 60,000 square yards per annum commencing with the seventh year on the basis of 60,000 square yards of leasing per annum." If you have 60,000 square yards per year; that is to say, available for leasing out, it would have taken 36 years to dispose of the entire area of 22 lakhs of square yards?

A.—Yes.

Q.—Thirty-six years is too long a period.

A.—That is a quotation from a letter of Mr. R. P. Russell.

Q.—He had gone into the scheme very carefully. He had considered the previous projects very carefully. Did you consider that aspect of the case, as to how many years it would take to sell the land?

A.—No; I did not. That was not within my province.

Q.—Were you told anything about it, or consulted?

A.—No; I was never asked a single question.

Q.—You have in your memorandum at various places made references to Committees appointed by the Government. I need not draw your attention to any particular passages, but in various places you have referred to that?

A.—Yes.

Q.—Did you at any time see the report of the Bombay Development Committee, published in 1914? (*Book handed to the Witness.*) Was that volume ever brought to your notice?

A.—I seem to recognise it, but I do not think I have read it.

Q.—Do you know the opinion that was given by Messrs. Jacob and Davies, the American engineers who had reported on the scheme?

A.—No.

Q.—It is page 185.

A.—No; I never saw their opinion.

Q.—I shall be obliged if you will kindly turn to page 185. It is a letter written by Messrs. Jacob & Davies, engineers, dated 21st March, 1911, to Ratan Tata, Esq. In paragraph 4, the last sentence is : " In our opinion this huge scheme is unnecessary and chimerical to the last degree. All this is entirely beside the question of whether the work can be done for the sum estimated by the Government engineers, which from the data collected on the ground last year by our representative, we consider is in the highest degree improbable, and we may even say, impossible." This is the opinion of very eminent engineers expressed in 1911?

A.—Yes.

Q.—Then later on they say : " We think that Government has got hold of the reclamation idea and has run it to death, without fully balancing in all their aspects what benefits and what harm will accrue to the city by this gigantic piece of meddling with the natural situation." Then if you will kindly turn to page 188, paragraph 8 of the same book, the same engineers express this opinion : " While we consider the Government cost figures as impossible on such a scheme as we deem proper and sufficient, they none the less had 13,000 borings from which to judge of the nature and quantity of the material available." Then at page 189 they say : " It goes without saying we gave you the best possible advice, not only with regard to yourself, but presumably with regard to the investing public, and stated we believe that the pressure on the available area of Bombay did not warrant any such scheme of reclamation, the return from which would seem to be highly doubtful, to put the case mildly. If the Government is willing to tax the people in favour of such a scheme, the matter assumes an entirely different aspect and puts a burden upon the public." Then at page 193, in paragraph 12 (*b*), at the middle of the page, he says : " As I have said before, both in the report and in letters to you, I cannot, for the life of me, see the slightest call for all this immense reclamation. Bombay has plenty of available area (except in the Native town) ; its population density," and so on. Then he says : " Any scheme of reclamation cannot be financially productive for many years (calculated at 31 years, I believe) "—according to that forecast it would be 36 years— " even at the low cost of reclamation which the Government arrives at, and even on the assumption that considerable blocks of land are taken up at rates of Rs. 25 per square yard per annum every year, while the reclamation process is still going on. This, I believe, is a far-fetched assumption, and not likely to be realised." Then I would draw your attention to these last few lines : " I should think that the Government would, or should, hesitate considerably before embarking on such a scheme, to find that the cost were higher than estimated or allowed for, which I believe would inevitably be the case, and finally to be compelled to leave it partly done, or have it drag on over much more time than was expected, or would not have the land taken up in the quantities or at the rates assumed, would be a disastrous affair for a town like Bombay." These gentlemen have turned out to be the real prophets.

A.—" I believe still that the place is ' reclamation crazy,' if I may use the term."

Q.—If you read the paragraph further on, he says : " My figure seemingly comes to over twice that of the Government, and my figure has large allowances which they may not have taken into account, for all that I know." The figure of the Government is evidently Mr. Kidd's. Then he says : Mr. Tata, I believe, will live to congratulate himself on having been persuaded from going into this thing, if the project ever comes off." Then on page 194 he says, in the last paragraph but one : " However, even in my over much more time than was expected, or would not have the land taken up in the Government's, and their estimates I can only look upon as optimistic."

A.—Yes.

Q.—What you have done is, you have taken a figure far below Mr. Kidd's figure, and yet here are these eminent American engineers who say that Mr. Kidd's figures are far too low. Can you give us any explanation as against the opinion expressed by these eminent engineers of America, who have eventually turned out to be trus prophets, as far as this scheme is concerned?

A.—No, I cannot. Who is Mr. Hewett?

Mr. Billimoria.—He is a partner in that firm evidently of Jacob & Davies, as you will see from the correspondence.

Chairman.—Was that letter addressed to the Tatas?

Mr. Billimoria.—Yes. It was submitted to the Committee and embodied in the report of the Bombay Development Committee of 1914.

Chairman.—That letter addressed to the Tatas must have fallen on very deaf ears, because, as we know, in December, 1917, the Tatas were crying out for a concession to do this very reclamation by dredged filling.

Mr. Billimoria.—We have heard a lot about that, but we do not know on what principle that was, or on what basis of figures the Tatas were prepared to do it. There is nothing before us. There is nothing to indicate that the Tatas were prepared to do it for 367 lakhs.

Chairman.—No.

Witness.—No, but they were prepared to do it. They were prepared to take on the work.

Mr. Billimoria.—Yes; but at what figure we have no evidence before us.

A.—I think that report is very interesting.

Q.—I am very glad that you find it interesting. What opinion have you to express about it?

A.—I do not know what data they had.

Q.—When you estimated you considered Mr. Kidd's figures were excessive. Messrs. Jacob & Davies find they are far too low—it ought to be twice as much. That is going back to 1911 or 1913?

A.—Yes.

Q.—Prices had advanced, as you have admitted, two-and-a-half times; so that if these figures are low, your estimate should have been at least $2\frac{1}{2}$ times as much, and not at the figure of 367 lakhs?

A.—Well, I do not know the data on which these people expressed their opinion, but I have given very freely the reasons I had in preparing my estimate.

Q.—Will you kindly return to your report at page 6: "The Government of Bombay are satisfied that Mr. Kidd's figures may be accepted with safety, as a sufficiently close approximation to the cost of the work to justify further investigation of the scheme." Then: "The Governor in Council has closely examined the figures, and is convinced that they have been drawn up with due care and are sufficient for the immediate purpose in view, and as such deserve detailed investigation." The Government therefore relied very much on the figures of Mr. Kidd, and did not consider them excessive. If you will kindly turn to page 7 of your report, you will find in paragraph 21 they say: "The investigation had been most carefully made, and might be accepted as exhaustive, the report was clear and complete, all doubtful points had been settled, and the revised estimate might be accepted as completely trustworthy and ample." So that the Government had ample confidence in Mr. Kidd's figures. Then in paragraph 24 of your report, it says: "The Government of India were, however, still unconvinced and expressed the opinion that a strong representative Committee should be invoked." Then at page 9 you stated that you did not agree with certain figures of Mr. Kidd, and that you had to go into the matter *ab initio* and prepare your own designs and estimates?

A.—Yes.

Q.—If the Government experts in various Departments, with experience at their back for a number of years, found that Mr. Kidd's figures were reliable, and if the independent experts, Messrs. Jacob & Davies, found that the figures were low, how were you tempted to believe that Mr. Kidd's figures were excessive?

A.—I do not know anything about the experts from America, I have not got their data, but really it would be very interesting to ascertain precisely to what extent the Government of Bombay did examine Mr. Kidd's figures.

Q.—As you will find from the corespondence between the Government of Bombay and the Government of India, when the figures were submitted, the Government of Bombay expressed the opinion that they had been thoroughly scrutinised and looked into by the Department of Government, and they relied on those figures?

A.—Yes.

Q.—Therefore, ordinarily one would take it that those figures were not excessive. If they were excessive, the Government Engineers would have pointed out that they were wrong and that they were excessive; but on the contrary they say they are trustworthy, thoroughly reliable, amply justified, and so on?

A.—With all due deference, I do not think that the officials of Government would ever say that an estimate was excessive.

Q.—They would not say that?

A.—I do not think they would say it was excessive.

Q.—They have not said it was excessive?

A.—I do not think that they would. They would not say that the estimate was excessive. I think you must consider in what spirit the Government of Bombay looked at the scheme. We know that a previous Governor, Lord Sydenham, was very keen indeed on getting his scheme through.

Q.—I will tell you why the Government of Bombay should have considered, if there was anything in it, that they were excessive, because at that time the Government of Bombay did not contemplate doing the work departmentally. It was to be done by a firm of contractors. The Government would not feel that 50 per cent. profit should go to the pockets of the Directors at the expense of the poor tax-payers of the City of Bombay. They would reasonably allow a certain margin for people who would come forward and undertake the job, but they would certainly not allow a private profiteer to come and put in his pocket 50 per cent. of 325 lakhs. Surely if you were there in the Government, you would put your foot down against any such proposal?

A.—I certainly should.

Q.—In the course of your evidence in reply to the Chairman, you have stated that the Government were inconsistent. I think you made that remark. I suggest that the Government were very prudent when they decided to have the scheme thoroughly examined by the best expert available before embarking on the scheme? If you would kindly turn to page 6 of your report, the letter from the Government dated the 6th December says that there was enough " to justify the further investigation of the scheme." So that they were not at all inconsistent when they employed an expert like your good self to advise the Government whether they should embark on the scheme or not? That was not an inconsistency at all?

A.—I cannot remember the remark that I made to the Chairman about there being an inconsistency.

Chairman.—I think I can tell you what it was. You pointed out that at one moment the Government had apparently regarded the report of Mr. Kidd as final and conclusive, settling every matter, and then there was a letter later on saying : " We have always recognised that we should have, before deciding this matter, to employ an independent expert." You are quite right in pointing out that there was an inconsistency there.

A.—Yes.

Q.—At one time they were saying that they regarded Mr. Kidd's report as final, satisfactory, complete and conclusive?

A.—Yes.

Q.—Then two or three years later they are saying : " We have always recognised that, before embarking on the scheme, we should have to take the opinion of an independent expert."

A.—Yes.

Q.—That was the point.

A.—Yes.

Mr. Billimoria.—I would rather not call it an inconsistency, but I would rather flatter the Government of Bombay, and say they were very prudent. They were very careful before embarking on the scheme to have another expert's advice; they were prudent, and not inconsistent.

Chairman.—They may have been inconsistent in a sensible way?

A.—Yes.

Q.—But it was not inconsistent. It does not follow that it was not prudent to do it.

A.—A prudent inconsistency, you may say.

Chairman.—You can have both.

Mr. Billimoria.—In the course of your evidence you have referred to the trials of the dredger on the Clyde. Do you suggest that the material in the Clyde is the same as the material that you find in Bombay Harbour?

A.—No.

Q.—The clay which you find in the Clyde is not the same as that in Bombay harbour?

A.—I have not any personal knowledge of it, but I should not say it was the same.

Q.—If it was the same do you think it was prudent or safe for an engineer of your repute to have placed an order with dredger builders which involved a test on the Clyde with material which you did not know about? What was the value of that test?

A.—If I may say so, I think really that question would be more suitably addressed to Sir John Biles, because he drew up the specification, and he arranged for the test. But I think you will find it is a very ordinary test. As I said this morning to Sir Frederick Hopkinson, this is not the only suction pump dredger that has been made, and I suppose there have been dozens and dozens of dredgers tested on the Clyde. Certainly I have had personal connection with 7 or 8 dredgers that were tested on the Clyde, in the same way that these dredgers were tested, and there has never been any complaint at all.

Sir Frederick Hopkinson.—It all depends what they have to do——how you test them, does it not?

A.—Yes.

Mr. Billimoria.—Was the material similar? It may be that the material in other harbours was infinitely better than what it was in the Clyde, so that the test would be a reasonable test?

A.—No; it was very similar material to the material at Bombay—clay and silt.

Sir M. Visvesvaraya.—They were suction dredgers, I suppose?

A.—Yes. The Calcutta Port Commission have got a lot of very powerful suction dredgers on the Hooghly, and I very often used to go there and inspect. The extraordinary thing is that of the numerous suction dredgers that have been built in the course of the last 20 or 30 years, this is the only case where there has been a charge of definite failure against the dredger.

Mr. Billimoria.—We will leave it at that. I take it that you kept diaries for all these years since you have given us so many details and dates of your various visits to Bombay, and so on? Could you produce any note from your diary with reference to your interviews with Mr. Messent in 1919 in connection with this scheme, when you were in Bombay in 1919?

A.—No, I do not think I can produce any note. In my private diaries I have merely made very short records.

Q.—If you had interviews with Mr. Messent I suppose they would be recorded in your diary?

A.—No, I do not think so. You must remember that I had known Mr. Messent for 30 years, and I frequently used to have dinner with him when I was in Bombay.

Q.—This was all after dinner conversation?

A.—Well, I think you probably will agree with me that most of the business in Bombay is done in after dinner conversations.

Sir Frederick Hopkinson.—Does not that account for the Bombay Back Bay reclamation works, because it looks very much like after dinner work?

A.—Or after lunch. He was a very great friend of mine, and I saw him as one does see an intimate friend—I probably saw him every day.

Mr. Billimoria.—I ask you that question because you have laid so much emphasis upon the information that was given to you by Mr. Messent. Undoubtedly Mr. Messent had a very great reputation in Bombay connected with the Bombay Port Trust, and one would look upon his view with a certain amount of weight and confidence.

A.—Mr. Messent and myself were boys together on large harbour works in the north of England, and therefore he was a very great friend of mine for the last 30 years. Whenever I have been in Bombay I would always go and see him, so that one did not have to go and write him official letters and say " Will you give me this information, or that information? "

Q.—It is very unfortunate so far as this Committee is concerned that Mr. Messent is dead and gone, otherwise we would have had some very interesting facts as to how he arrived at this data and how he communicated this data in conversation to you. You were employed as a technical independent expert by the Government to advise them on the feasibility of the scheme from an engineering point of view. Did any member of the Government or the Governor of Bombay or any officer at any time ask you to rely on Mr. Kidd's borings.

A.—No, certainly no one asked me to rely on Mr. Kidd's borings.

Q.—You were called upon to submit an independent opinion?

A.—Yes.

Q.—If you turn to the terms of reference there is no suggestion whatever that you had to depend upon Mr. Kidd's borings or anything of the kind?

A.—No, there would not be, but if you look at page 21 in my statement you will see a telegram from Lord Lloyd stating " My Government are desirous of securing your services at once. All plans and data are here."

Q.—That does not give any indication that you had to rely upon that data. Looking to the terms of reference as stated, page 1 of your report, the specific points on which your opinion was required, was: " The practicability of the scheme from the engineering point of view. (2) The suitability of the type of wall proposed, or alternate suggestions for better types. (3) The suitability of the proposed method of reclamation by means of dredging, or alternative proposals for same."

A.—Yes.

Q.—There is no indication that you had to rely on Mr. Kidd's borings or upon any of the past figures or data, but you were called in as a special expert, and Lord Lloyd made it perfectly clear that he would depend on your advice. If you turn to

page 9 of your report it gives the impression to anyone reading it that you had prepared this report quite independently of Mr. Kidd, because on certain points you differ from Mr. Kidd, and you say : " Under those circumstances I have had to go into the matter *ab initio* and prepare my own designs and estimates."

A.—Yes; that is true.

Q.—" There can be no doubt that for the following reasons the scheme is practicable." You are expressing there a very definite opinion?

A.—Yes.

Q.—Any layman or man in the street reading this report would come to the natural conclusion that your report was based upon a thoroughly independent careful investigation and examination?

A.—If you turn to page 11 of my report you will see I say : " On the assumption that Mr. Kidd's surveys and borings are correct, and I see no reason to doubt their accuracy, as a great many borings were taken, I accept his conclusion both in respect to quality and quantity of material."

Q.—That is true.

A.—I still maintain that I have never had anything to do with a project where there has been a more complete and systematic investigation by borings than by Mr. Kidd. In my letter on page 29 of my statement of the 29th May I wrote to the Joint Secretary of the Government of Bombay and the Public Works Department, and said : " I have examined the site on several occasions, and have satisfied myself that the survey and borings made by Mr. Kidd are sufficient to enable me to write my report."

Q.—That gives an impression that you have made some sort of independent investigation?

A.—In my examination by the Chairman I think that came up, and we agreed that " I have examined the site on several occasions " did not mean that I had taken any borings, but that I had gone over the ground and had satisfied myself that the survey and borings made by Mr. Kidd were sufficient to enable me to write my report. I had to report on Mr. Kidd's scheme, and I still say that Mr. Kidd's survey and Mr. Kidd's borings were sufficient. After all; Mr. Kidd's borings and Mr. Kidd's plans and Mr. Kidd's scheme had been sent to the Government of India by the Government of Bombay, with an expression of opinion that they were absolutely complete in every respect. and could be accepted with confidence.

Q.—So that any assumption with regard to the reliability of Mr. Kidd's borings was made on your own responsibility. No suggestion was ever made by any officer of the Government that you should rely upon them. If you relied on them it was on your own responsibility?

A.—I accept all the responsibility for relying on Mr. Kidd's borings.

Q.—Sir Frederick Hopkinson having taken you through the various figures of the comparative estimate, I need not trouble you about it, because he has already anticipated my questions, and I shall only ask you one question regarding it. Taking the cost of the sea wall alone, Mr. Kidd estimated 64 lakhs, and you in 1919 increased it to 118 lakhs?

A.—Yes.

Q.—In 1922 you increased your own figure to 200 lakhs, and the Chief Engineer in his project estimate increased it to 235 lakhs?

A.—Yes.

Q.—So that your figure of the sea wall was more than three times Mr. Kidd's figures?

A.—Yes.

Mr. Billimoria.—In spite of that, in your note you say that you have made a considerable saving on the sea wall. The dimensions of the wall were considerably increased, but the expenditure, on the contrary, has gone up. How do you reconcile that?

Chairman.—It is a considerable saving upon a section of the sea wall?

A.—Yes, and alteration in the design.

Mr. Billimoria.—The sea wall was reduced both as regards the weight and height?

A.—Yes.

Q.—But the expenditure has been twice your original figure, and three times Mr. Kidd's figure?

A.—Yes.

Q.—Have you any explanation with regard to why that figure has gone so high?

A.—I think a great deal too much money has been spent on the sea wall.

Q.—By whom?

A.—By the Development Directorate.

Q.—Had you no control over that?

A.—Absolutely none.

Q.—Why did not you put the brake on, saying they were not within the estimated figure? You are there as responsible engineer for the scheme.

A.—I never knew what the work was costing.

Q.—I know you have made a grievance of that.

A.—That is a fact. I could not put the brake on when I had not the faintest idea how much money they were spending.

Q.—Then what did you mean by being " responsible engineer "? In the book of correspondence at various pages you call yourselves " responsible engineers to the Government." What is the meaning of the expression " responsible engineers " if you allow things to drift in the manner they have done? Where do you come in as the responsible engineers?

A.—I think that would be more suitably argued by my Counsel.

Mr. Billimoria.—If your learned Counsel is going to argue that I shall listen to him with great attention.

Sir H. Courthope-Munroe.—That is all I want.

Chairman.—You want something more than that. You wish to carry your audience with you.

Sir H. Courthope-Munroe.—I hope so.

A.—I would just say that there seems to be as many definitions of " responsible engineers " as there are of " unctuous clay."

Mr. Billimoria.—If we had at every stage and every turn to fall back upon the dictionary, I suppose business morals would never exist.

A.—No.

Q.—I would invite your attention to the matter of moorum toppings. I want to refer to page 86 of the book of correspondence and to your report, page 4. In your report you say one foot of moorum toppings is sufficient?

A.—Yes.

Q.—At page 86 of the book of correspondence Mr. Lewis writes to you on the 29th May, 1923: " I am told that the thickness of moorum laid over the harbour dredgings averages something like 6 feet, and rises to 9 feet in places on the Mazagaon reclamation." If you had any conversation with Mr. Messent with regard to this moorum topping, Mr. Messent had experience and had personal knowledge that the moorum required there was 6 feet deep and not 1 foot. How did you come in your report to take the figure of only 1 foot?

A.—But we hoped to get much better stuff than they got in the Sewri reclamation.

Q.—Have you ever been to the Sewri reclamation?

A.—Frequently.

Q.—You must have noticed that the moorum topping is nearly 6 feet deep?

A.—Yes.

Q.—In many cases it is more than 6 feet.

A.—They began with a great deal less, and they they had to increase it.

Q.—In spite of that experience and knowledge, were you satisfied that only one foot of moorum topping was sufficient for the Back Bay reclamation?

A.—Well, the Sewri reclamation was very largely mud. Later they went into blue clay, but the Sewri reclamation is not on a rock foundation. We thought that 1 foot would be enough over the area. There is another point to be remembered. A great deal can be said about the quantity of moorum. It was decided in consultation with the town planner that it would be extravagant to put a foot of moorum over the entire area; and that the moorum should be confined to the roads, because you would not want to go and put moorum on the site of a house, which would be at once dug up for the foundations. So that there were several estimates for moorum. After the lay-out was obtained from Mr. Davidge there was another estimate got out for moorum on the supposition that it would only be laid on the roads.

Q.—Were you satisfied at the time when you wrote this report that 1 foot of moorum topping was sufficient?

A.—I was.

Q.—Within a short time thereafter you changed your opinion and made it double the quantity. In your revised estimate you take it at 2 feet deep?

A.—Yes.

Q.—Were there any circumstances, strange or unfamiliar or extraordinary, to make you believe otherwise in 1922 to what you believed in 1919?

A.—That, I think, we discussed when I said Sir Lawless Hepper had asked me to put on an amount for moorum reclamation and equipment.

Q.—May I ask you to direct your attention to page 103 of the book of correspondence? Mr. Lewis says : " That the whole show has busted." I will read the whole of the paragraph : " I would point out that we are by no means sure that the filling from the harbour is going to be of use as a means of reclaiming the area. If it proves unsuitable the fact will become common property about the time the work at Marine Lines will be stopped. What inference is the man in the street to draw?—' That the whole show has busted '." Have you any remarks to offer with regard to those remarks of Mr. Lewis?

A.—No ; I only saw them since this Committee sat. They were not addressed to me.

Q.—You have no knowledge of those?

A.—No; no knowledge of those. They were addressed to his immediate chief, the Director of Development, and I never saw the correspondence between the Director of Development and Mr. Lewis.

Q.—Do you mean to say that such materials facts were kept back from you by the Development Department?.

A.—Well, if you call that letter a material fact, that would never be sent to me.

Q.—It has been suggested that you and Mr. Lewis were not on good terms, practically not on speaking terms. It has been said because Mr. Lewis pointed out various defects in your working that you were hostile to him, and you actually recommended the Government of Bombay that his service should be terminated. Have you any explanation to offer with regard to that? I only say it has been suggested.

A.—Yes ; I think I have made it sufficiently clear in my statements in my examination by the Chairman and others that I have no hostility at all, and never had, against Mr. Lewis. I believe I have spoken very fairly about him indeed in this room. All that I say is that his health broke down absolutely, and that affected him mentally and physically. As to personal hostility, I had none at all. It is quite true that he was in such a peculiar state that he would not see me. I have got a note, which I showed to Sir Lawless Hepper, that the last time but one when I was in Bombay, although I had been several weeks in Bombay, Mr. Lewis had refused to come near me more than two or three times.

Q.—So that I take it you are prepared to repudiate any suggestion made in Bombay that because Mr. Lewis pointed out various defects in your working you were hostile to him?

A.—Most emphatically.

Chairman.—That has not been stated in evidence.

A.—No.

Mr. Billimoria.—That has not been stated in evidence, but that is the suggestion which is made.

Chairman.—I am not taking any notice of anything unless it is in the evidence.

Mr. Billimoria.—Turning to page 12 of your report, you will find in paragraph 37 : " From Mr. Kidd's plan I see he proposes seven pipe lines across the peninsula. I think this number is excessive, and have reduced the number to three." Have you any special reasons for disagreeing with Mr. Kidd?

A.—Yes; I have a number of reasons which will appeal to you very much as a resident of Bombay. One of Mr. Kidd's pipe lines was to go through the heart of Bombay I cannot remember the names of the buildings now, but it was quite impracticable to put a pipe line through there. I think they went past the Majestic Hotel, and through the congested part of Bombay.

Q.—We have heard Mr. Kidd, and Mr. Kidd said that it would be impossible to have this reclaimed with three pipe lines. The scheme could never work with three pipe lines. Do you still disagree with him?

A.—I do ; and I do not see how he was going to put in his seven pipe lines.

Q.—You conclude your statement by observing that the scheme could be brought to a triumphant success. Do not you think that is a very bold statement to make when you are alive to the fact that, as a result of relying on your advice, the Government of Bombay are now placed in a most embarrassing position?

A.—Not for relying on my advice, but for relying on the powers given to the Development Directorate to spend money and carry out the work.

Q.—Do you seriously suggest that if there was no Development Department and you were the responsible engineer in charge, you would have carried out this project for 367 lakhs and completed it? Is that what you are seriously suggesting?

A.—No ; I do not. Though Sir Frederick Hopkinson disagreed with me, I say that prices very materially increased between 1919 and 1922, and to-day the prices of labour in Bombay are considerably higher than they were in 1919.

Sir Frederick Hopkinson.—They are only double pre-war prices to-day.

Mr. Billimoria.—The scheme which was expected on a modest estimate to provide a profit of 30 crores will, on a careful consideration of all the circumstances as now ascertained close with a loss of 13 or 14 crores. Would you still call that scheme a triumphant success?

A.—Why should you say it will close with a loss of 13 crores?

Q.—That is the opinion of the Government of Bombay on the subject, expressed in their letter. You are fully aware of this correspondence, I take it?

A.—No; I do not think I am.

Q.—If you refer to page 179 of the book of correspondence this is what the Government of Bombay say: "The Government of Bombay undertook the work believing in the reasonable accuracy of Sir George Buchanan's estimate. The result so far has been that the annual output has not been more than 25 per cent. of it, and a careful and prolonged investigation shows that unless substantial improvement can be attained the work will not now be finally completed till 1944, and that assuming that the whole area is sold off by 1952 the scheme will close with a loss of between Rs. 13 and 14 crores. This loss written back to the present day is equal Rs. 3 crores, and Government are confronted with the necessity of writing off this sum. The result, in practice, is that provincial revenues will be burdened for 60 years with an annual payment of Rs. 20 lakhs to cover the interest and sinking fund charges on the anticipated deficit, and provision for the first payment had been made in the budget estimates for 1926-27."

A.—Is that from the Government of Bombay Development Department?

Q.—Yes.

A.—Well, that is practically Sir Lawless Hepper, is not it?

Q.—It is written by the Secretary to the Government.

A.—Yes; he would see the letter. That is the extraordinary situation.

Q.—According to what we now find, the resources of the Presidency are mortgaged for a number of years to come.

A.—I hope without being too optimistic that these figures will not be fulfilled.

Q.—That is not the view of the Government alone, but people within and without the Government have expressed grave doubts on the practicability or feasibility of the scheme ever turning out to be a financial success. Those are the remarks with which I conclude the examination in reference to your observations that the scheme is going to result in a triumphant success, and I thank you for the assistance you have given.

A.—Thank you very much.

Re-Examined by Sir H. Courthope-Munroe.

Sir H. Courthope-Munroe.—Mr. Billimoria has been good enough to refer Sir George to the fact of my appearance here as Counsel, and I hope your answer to him has satisfied him that in the special circumstances you were entitled to appear by Counsel, and I hope Mr. Billimoria will take it from me that I shall do my very best to assist the Committee to arrive at a true determination of the facts.

Mr. Billimoria.—I very much appreciate that and thank you for it.

Sir H. Courthope-Munroe.—May I fill up the remainder of the day, instead of dealing with the big questions, by clearing up some of the matters that have been dealt with this afternoon? It is not often one has an opportunity of travelling back into a large number of matters, and there are certain facts which are fresh in the minds of us all to-day which might be dealt with to-day and cleared out of the way. May I start by getting rid of the vexed question of Mr. Lewis, and once and for all bury it? It has been said that there was an antipathy between you and Mr. Lewis. I think Mr. Billimoria, if I caught him rightly, suggested that at some stage Mr. Lewis took objection to your instructions, or quarrelled with you as to the nature of his orders?

A.—There was a suggestion to that effect in Bombay.

Q.—Let us try to clear it up. Mr. Lewis, when you honesty recommended him to the attention of the Government, was in your view, a good man?

A.—A most excellent man.

Q.—With a good record?

A.—With a very good record. A great deal has been said about Mr. Lewis, and Mr. Lewis, when he appeared before this Committee, was, I understand, obviously in very bad health. I have known Mr. Lewis for a number of years, and I have no hesitation in saying that he was quite one of the ablest men in the Indian Public Works Department. He was the same type of engineer that is carrying out to-day the Sukker Barrage, and other great works in India. He was an excellent type of Indian Public Works Department engineer.

Q.—And had he been in a responsible position and had done good work?

A.—He had been in a responsible position and had done good work.

Q.—Let us dispose of the question of Anno Domini: what was his age when you suggested his taking over this work? Was he an old gentleman down and out, or what were his years?

A.—He appeared to be in robust health, I do not know what his age precisely was.

Chairman.—I should think about 49 to 50.

Sir H. Courthope-Munroe.—That is near enough.

Chairman.—He was just at the end of his service?

A.—He retired at 53, I think.

Sir H. Courthope-Monroe.—You would not say that everybody who had reached 50 years of age ought to be abolished?

A.—No.

Q.—You would not put it quite as high as that?

A.—No.

Q.—Assuming he was a sound man when you recommended him, which was in 1920?

A.—Yes.

Q.—In April, 1922, you had come to the conclusion, which I think you expressed in a letter of the 11th April, 1922, that Mr. Lewis's health had gone. You used the expression that it was a danger for him to continue with the work—that he was dangerous to the work?

A.—Words to that effect.

Q.—He had got to that stage?

A.—He had got to that stage.

Q.—Then on the 12th May you again write—I am epitomising your letter—saying Lewis is not up to the job. Then on the 3rd June, the next month, you complain in a letter that you could not get any information from Lewis, and that he was keeping you in the dark. Then a week after that you write a letter on the 8th June, of which my summary note is: "Lewis must go." That was in 1922?

A.—Yes.

Sir Frederick Hopkinson.—There was one letter which said he was too old.

Sir H. Courthope-Munroe.—I will come to that in a moment. So that he having come on the scene in 1920, in 1922, April, May and June, you write in various stages that the time had come when he was dangerous to the work, and not up to the job, and that Lewis must go?

A.—Yes.

Q.—He did not go. He remained on although you said he was a danger to the work all through 1922, and all through 1923 till August. Then you write on the 30th August, 1923, a letter which I will summarise by saying again, "Lewis must go."

A.—Yes.

Q.—In point of fact the man whom you had stated, in your opinion, was a danger in 1922 did not go till the 12th July, 1924?

A.—Yes.

Q.—So that he was in charge, notwithstanding your complaints, for two years and several months, dealing as responsible engineer with this very important work which, as Sir Frederick Hopkinson has repeatedly said, was the crux of the whole thing. That was notwithstanding your protest?

A.—Yes.

Sir Frederick Hopkinson.—You will realise at this time, in 1922, nothing practical had been done beyond ordering the dredger?

Sir H. Courthope-Munroe.—I am not arguing with you about it. I want to get these facts on the notes. I am reminded that in the final letter which I referred to of the 30th August, 1923, my summary of it saying, "Lewis must go," is not strong enough, because you say in that letter, which appears on page 87 of your statement: "Mr. Lewis no longer possesses our confidence. We believe he has done good work in his time, possibly he is still suffering from bad health or he is too old for the job; he appears to have no grip of the works; there is no co-ordination or planning out ahead, and we are convinced that, in the interest of the work, an immediate change is necessary."

Chairman.—That is right.

A.—"Old" is a relative expression.

Sir H. Courthope-Munroe.—I understand, as to the whole of this business you are going into this because you are bound to do it because, as the Chairman has said, there is no room for sentiment in this case unfortunately in view of what has happened, but the whole thing is very distasteful to you?

A.—Yes.

Q.—You are challenged about it, and you are now endeavouring to point out that for two years and three months you had been preaching the gospel "Lewis must go"?

A.—Yes.

Q.—The answer which is sent by Sir Lawless Hepper is this: "Your letter of the 6th September regarding Lewis' services. Lewis has intimated that he proposes to take eight months' leave due to him next July preparatory to him retiring." So that apparently he was to run on from September to July, and then the matter was to be considered?

A.—Yes.

Q.—He being there meanwhile in this state in charge of this most important work?

A.—Yes.

Q.—"After careful consideration the Government consider it desirable to accept his proposal." So much for that. You told the Committee that you honestly recommended Lewis and that he was a good man, but his health failed him, and when the time came, upwards of two years in fact before he went, you suggested that he should go?

A.—I did. I spoke twice to the Governor of Bombay on the subject. That is on record. There was also a meeting with the Member of Council concerned.

Q.—Do you think it is fair at this stage of the inquiry to charge you with anything that could be laid at Mr. Lewis's door? What more could you have done?

A.—I do not see that I could have done anything more. The Chairman suggested that I might have resigned.

Q.—That is a counsel of perfection. I will venture to deal with that when I address the Committee. You are referring to what the Chairman said about resignation?

A.—Yes.

Q.—Mr. Billimoria put a question to you about Mr. Kidd's figures. Let us just get rid of that once and for all. You have given a reason which in your view is a good reason why you regarded Mr. Kidd's figures as excessive?

A.—I have.

Q.—Will you put it in half a dozen words again, and we will leave it? May I refer to what Lord Lloyd drew attention to in his evidence? There was a clause in the agreement that in the event of there being a saving, there should be an allowance made for it?

A.—Yes.

Q.—Human nature being what it is, you thought naturally the man would be on the safe side, but when you came down actually to bed rock figures you thought they were too much.

A.—I honestly thought they were too much.

Q.—That is the point?

A.—Yes.

Mr. Billimoria.—I am afraid there is a little confusion with regard to that. That was not with regard to the original estimate. That was in connection with the second scheme.

Sir H. Courthope-Munroe.—That is my mistake. I thought that was the point.

Mr. Billimoria.—No; it was with regard to the smaller scheme.

Sir H. Courthope-Munroe.—I beg your pardon.

Chairman.—He said he wanted one-fifth even in the 325 scheme.

Mr. Billimoria.—I do not think so.

Chairman.—We will see about that.

Sir H. Courthope-Munroe.—If you would not mind looking at Lord Lloyd's evidence, the whole thing is put in a nutshell. If we read that we are possessed of all we need say about it, and there is an end of it. This question was put on page 74 of Lord Lloyd's evidence: "If one believes that Mr. Kidd has made a reasonably accurate estimate of 325 lakhs, and had noticed that he had said he was loading the labour with 20 per cent. for possible rises, and that he was loading the price of materials with 20 per cent. for possible rises, and if anybody had thought the matter over and came to the conclusion that Mr. Kidd's estimate was probably an accurate one, ought it not to have occurred to your advisers and, indeed, to you, when you were reading it"—this is the crux of the thing—"that if Mr. Kidd could do it for 325 lakhs Sir George Buchanan could not possibly do it for under 700 lakhs." That is a question and a perfectly clear question, and it is also the question which has been put to Sir George. Lord Lloyd's reply is

this : My reply to that is : no, I do not think so. I think I have apprehended your point rightly. I am not aware how far the items of Sir George Buchanan's estimate have been actually checked with reference to rates for labour and materials prevalent in Bombay in 1919. I can only make a general criticism, which is a layman's observation, and say that in the first instance the estimate of Sir George Buchanan was not accepted at 367 lakhs. You are probably aware of that, are you not? That is not accurate."

Chairman.—We can dispose of this in a moment. Mr. Kidd did in fact in the 325 estimate stipulate for one-fifth of the saving.

Sir H. Courthope-Munroe.—Yes.

Chairman.—It is page 7 of his report : "' The further condition proposed of one-fifth from any savings effected would make it in our interest, as well as that of the Government, to attain the most economical result."

Sir Frederick Hopkinson.—It is a very common stipulation.

Mr. Billimoria.—But that is the alternative.

Chairman.— That is the actual text of Mr. Kidd's report of 1912.

Sir Frederick Hopkinson.—It is a common stipulation, and a very good one.

Sir H. Courthorpe-Munroe.—When your figure came out to be under his, the reason right or wrong was that you thought the figure he put a tall figure, or a little bit more than you thought it would work out to be?

A.—Yes.

Q.—You thought on that there would be something on which that one-fifth rebate would be payable?

A.—Yes.

Q.—Mr. Billimoria also referred to a matter which I think you have very much at heart, and that is the fact that Lord Lloyd placed implicit confidence in you?

A.—Yes.

Q.—I think you hope that you still deserve it?

A.—Certainly I hope so.

Q.—So far as you know, have you done anything not to deserve it?

A.—No, I do not see that I have done anything to deserve losing his confidence.

Q.—You have repeatedly said that you were not called upon to advise the Government of India upon the financial side of the scheme?

A.—That is so.

Q.—What you were asked to do was, to advise as to the practicability of the scheme?

A.—Yes.

Q.—In a broad sense finance is involved in that; but the finance of the matter was for the Government to consider?

A.—Absolutely.

Q.—In dealing with a vast and important country like India, there may be many things which would be most advantageous to the country that might at the moment be bad from the mere financial point of view?

A.—Yes.

Q.—But your view, which you have expressed to the Committee, is that in the long run Lord Lloyd's views will prove right, and that when this is completed, in the end it will be a big thing and a good thing for India?

A.—In the long run I certainly hope that it will prove a success, and that Mr. Billimoria will live to see it.

Q.—We hope so. Then Mr. Billimoria tried to draw you along the slippery path of giving the date when the work would be completed. You could not do that; but I suppose as a matter of fact if this matter is put out to, I will not say world competition, but put out to the big contractors to deal with, you will get a fair opinion as to when the work can be completed—if the matter is offered to contract, with the time limit, and the views of the contractors are taken?

A.—At the present moment I have ceased to have anything to do with the work.

Q.—Let us hope that is only a temporary matter.

A.—When things have settled down and the matter has been taken away from the Development Directorate and possibly given to contract, I am confident that there will be an enormous change.

Q.—It has been said that although this thing is a failure and all wrong financially, substantially the trouble has been over the cost of dredging?

A.—Entirely.

Q.—You say entirely; I was going to ask you whether there may be other things, but that is the big thing. The big thing that has caused all the trouble is that the cost of the dredging has simply run away with everything. I think I can certainly say that. I do not think anyone will disagree with that.

A.—No.

Chairman.—There is also the long length of sea-wall, which has cost 200 lakhs, which is now lying idle, and interest on which is being lost each day.

Sir H. Courthope-Munroe.—Yes.

Sir Frederick Hopkinson.—It is not only the cost, but it is the failure of the dredgers to do the work in the time.

Sir H. Courthope-Munroe.—Yes. I am coming to that. This is the big thing. The failure of the dredging may be owing to your having useless plant, or faulty plant, or inadequate plant; or it may be due to what you repeatedly have referred to as the "human element".

A.—Yes.

Q.—Rightly or wrongly, you think that it is the human element?

A.—I do. I think that it is the human element.

Q.—You still think, and you have said so to this Committee, that notwithstanding all you have heard about the comments that have been made, and all the evidence that has been given, that this dredger is right?

A.—I do.

Q.—And you would order it again, if you had to do similar work?

A.—Certainly, I should order the same type of dredger.

Q.—I think I am right in saying that you do not stand alone in that view. A witness, Mr. Speirs, who was called in Bombay, agrees with you, and Mr. Kidd approves of the cutter. Mr. Elgee also says that the cutter did its work. Mr. Brims admits that it is possible to get 2,000 yards an hour out of it?

A.—Brims admits that he has got 2,000 yards.

Q.—Mr. McMurray says that the dredger did in fact 75 per cent. of what it was to do in the Clyde. I will meet the point about the Clyde in a minute.

A.—Yes.

Q.—Whether you are right or wrong, do you stand alone in your opinion?

A.—No.

Q.—You have five or six people who take the same view?

A.—Yes; and Sir Henry Lawrence gave a very favourable opinion.

Q.—Sir Henry Lawrence added the valuable point in his evidence that the crew of the dredger had actually to be got rid of and replaced?

A.—Yes.

Q.—That rather points to the human element again?

A.—Yes.

Chairman.—You must not enlist Mr. Kidd amongst your supporters. He may have approved of the particular type of rotary cutter, but he disapproved of the inadequacy of the horse-power, which is very important.

Sir H. Courthope-Munroe.—One labours under a disadvantage in this case where one comes in really on the 30th or 40th day, and one has to pick out on the Shorthand Notes the various points; and I rather gathered that Mr. Kidd had approved of the cutter.

Chairman.—That is right: but when it turned out that the "Sir George Lloyd" was stated to be of 3,500 horse- power pumping, he held his hands up and said: "Your difficulties are explained".

Sir H. Courthope-Munroe.—You have had the advantage of seeing him, and I quite accept that. It is rather important, on this very big question, at some early stage that we should put before the Committee your view and Lord Lloyd's view, and the view that one can gather from the whole of the scheme, as to what in fact your duties were.

A.—Yes.

Q.—We will try to do it to-morrow. Your case is that the whole of the man-handling of this dredger was in the hands of the gentleman who was called the "Chief Engineer," but who was in your document called the "Resident Engineer," Mr. Lewis?

A.—Yes.

Q.—As to whom for two years and three months you were the voice crying in the wilderness to get rid of him. He was the man who had the handling of this?

A.—He and his staff.

Chairman.—He should have been the driving force behind the whole concern?

Sir H. Courthope-Munroe.—That is it—the driving force, acting under Sir Lawless Hepper, whom Lord Lloyd dignified by the name of the " watch-dog "?

A.—Yes.

Sir H. Courthope-Munroe.—What sort of watch-dog he was we will go into later.

(*Adjourned to to-morrow morning at* 10.30.)

The Committee Assembled at 10.30 a.m. on the 13th November, 1926, all Members being present.

The examination of Sir George Buchanan was continued.

Sir H. Courthope-Munroe.—Sir Grimwood and Sir George: I was going to suggest, if I may, that the time of the Committee would be saved if at this stage, instead of my continuing the re-examination of Sir George Buchanan, I should take advantage of the opportunity you have given me of saying a little upon the meaning, as I understand it, of the agreement. I have to put a number of questions to Sir George which must go upon a certain basis, and I think it would be in the interests of time if I were now, with your permission, to endeavour to deal with what I conceive to be the true construction of the agreement. Then when we have discussed that we are rather more on a basis to go on with my questions to Sir George; but I am entirely in the hands of the Committee.

Chairman.—Certainly.

Sir H. Courthope-Munroe.—Then, with your permission, I will proceed to do that. This matter really opens in consequence of observations which you were good enough to make in the course of the proceedings when, at the end of the meeting on Tuesday, 2nd November, in the course of the morning you put this to me. You said: " Sir George and Sir Harry, this is, in our opinion, a very curious and very difficult agreement. I do not know whether you have studied it at all, but I think if you would consent to extend your powers here a little, and would just address us for half an hour at some time on the text of this agreement, and on the point as to how far Sir George was responsible for the execution of the works as apart from supervision, it would be very useful." That is a matter upon which, on behalf of Sir George and certainly for myself, I am very much indebted to you for the opportunity you have given me. My only regret, if I may respectfully say so, is that this opportunity should be afforded at the 58th meeting, and not at the first meeting; but that is the irony of events.

Chairman.—You were not present at the first meeting.

Sir H. Courthope-Munroe.—I was not present. That is one of those things which really no one can control. Viewing it from my standpoint, and viewing it also from the terms of reference to this Committee, it does seem to me to be essential that before one starts out as this Committee has got to do, to apportion blame one must ascertain what is the contractual duty, and even, if I may so put it, the moral obligations of those persons who are concerned in the matter.

Chairman.—Did you say: " Before this Committee starts out, as it wants to do, to apportion blame "?

Sir H. Courthope-Munroe.—No.

Chairman.—We do not want to apportion blame. We may have to do it as part of our duty.

Sir H. Courthope-Munroe.—I agree; but what I meant was this. Taking, very shortly, the original terms of reference, you are to enquire: " Into the history of the inception and conduct of the Back Bay reclamation scheme." Naturally you have had, in an immense enquiry like this, largely to amplify that; but taking the mere word " conduct," that must mean and can only mean the conduct of A, B, C, D, E, and F—whoever have been concerned in the matter.

Chairman.—Quite so.

Sir H. Courthope-Munroe.—I respectfully suggest before you can consider and weigh the blame to be attached to the conduct of A, B, or C, you must ascertain in your own minds what you believe to be the contractual obligation of A, B, C, or D. That is too obvious, almost to state. That being so, it is a matter of regret that this agreement, which is the basis and the foundation, in one sense, of this enquiry, should lend itself to

being spoken of by you as "a very curious and very difficult agreement." I am not prepared to challenge that for a moment. It is emphasised, if need be, by this fact, that almost throughout this enquiry Sir Frederick Hopkinson has intimated his view as being that my client's position is, for all practical purposes, that of a contractor. That is his view, and he may be entitled to hold it. On the contrary, another member of the Committee, Sir M. Visvesvaraya—I do not know whether he happens to be a lawyer—has expressed a view, which is the view I take and the view which I am going to urge upon you most strongly, which is directly contrary to the view taken by Sir Frederick Hopkinson. Might I refer briefly to page 21 of the Evidence, and read what Sir M. Visvesvaraya said, because it expresses very succinctly and very clearly the view I want to put before you

Chairman.—Which note are you reading from?

Sir H. Courthope-Munroe.—I am reading from page 21 of the notes of the evidence of Sir Lawless Hepper in cross-examination.

Chairman.—That is page 21 of the evidence of Sir Lawless Hepper.

Sir H. Courthope-Munroe.—Of the print, not of the type. I only read this because it shows the various views. We have a difficult agreement to construe, and you have the view on one side of one gentleman, and the view on the other side of another. Before you can endeavour to do justice you must get, if you can, at what the meaning of that agreement is, and attach a meaning to the agreement.

Chairman.—Certainly.

Sir H. Courthope-Munroe.—Sir M. Visvesvaraya says this: "The engineers give professional advice, but they have no responsibility for the expenditure. The responsibility must rest either with the Director or with the Government of Bombay.—(A.) The Government of Bombay sanctioned the estimate. (Q.) But they worked through you? —(A.) Yes; but Meik and Buchanan are to carry out the work." Perhaps I might break off there to call attention to this. That answer is incorrect, if you look at paragraph 3 of the agreement, as I shall do in a moment. You will find that the carrying out of the work is, by paragraph 3, dealt with in distinct terms. Those words: "Carry out" are used in that paragraph 3, and, as far as I can see, they are not used anywhere else. That is handed over to the Director of Development and to the resident engineer. The next question put by Sir M. Visvesvaraya is this: "The local Directorate carries out the work, and is responsible for the expenditure. All technical advisers take no responsibility for the progress of the work, or for the expenditure. They advise at every stage." Then you very properly pointed out that that depended upon the construction of the document, which it obviously does. Then you say: "When he was described as engineer Sir George Buchanan's assertion was: 'I am nothing of the sort.' He wrote a letter to say: 'There appears to be a misunderstanding. We are not consulting engineers. We are the actual responsible engineers.'" Then Sir M. Visvesvaraya says: "That is their assertion, but it has not been accepted by the Government.—(A.) Of course." There, again, may I pause to say this? In discussing this matter with you I am accepting your invitation to discuss it as a lawyer. What Sir George Buchanan may have thought fit in the loose language of letter-writing to assert or not to assert, does not affect the position I am putting before you. I am putting before you, to the best of my ability, the documents and the agreement, and I am asking you to construe them. I agree with what Sir M. Visvesvaraya says: "That is their assertion, but it has not been accepted by the Government."

Chairman.—Will you just consider an intermediate possibility, the possibility that they were engineers, and in certain respects performing work generally performed by contractors? That does not necessarily mean that they had any responsibility for the execution of the works at Bombay. We must keep that very clearly in our minds.

Sir H. Courthope-Munroe.—I follow you.

Chairman.—But were they solely and entirely in everything they did engineers, or were they not, as regards some very important part of the work, doing work ordinarily done by contractors? Supposing one were to agree with you, then you have to look a stage further and ask: "Was there, in fact, any responsibility for the execution and the progress of the work in Bombay apart from the duty of supervision?"

Sir H. Courthope-Munroe.—Yes; I quite agree, and I am much obliged to you for putting it to me so clearly.

Chairman.—Those are the three positions.

Sir H. Courthope-Munroe.—Yes. When I come, at a later stage, to the actual document, I shall endeavour to extract from that document the whole of Sir George's contractual obligation, and the whole of his duty, as I conceive it. So much for that.

Before I come to deal with the actual document and the modification that was made in 1923—you remember there was a letter about it, and I treat it as one—it is necessary in order to get into one's mind the position to refer to four matters. First of all, there is the report of 1919. I shall touch upon that very lightly. Then there is the scheme—I think that is the correct word to use—called the Bombay Housing and Development Scheme, which was the result of the report.

Chairman.—I do not quite follow that—the report of 1919?

Sir H. Courthope-Munroe.—There is Sir George's report of 1919 which we have had *ad nauseam.*

Chairman.—Then you said the Bombay Housing and Development Scheme?

Sir H. Courthope-Munroe.—There is a document I have got called " The Bombay Housing and Development Scheme." That is dated the 17th March, 1920, which is the following year. I want to refer to that because that in effect deals with the foundation of the Development Department.

Chairman.—Yes; the Development Directorate.

Sir H. Courthope-Munroe.—Then the next stage which I want to refer to again in some detail is Lord Lloyd's evidence, because he deals with the history of the thing and the calling in of Sir George, his report, then the scheme, and then he tells the Committee what he thought to be the working of the scheme within the intention of the agreement. Then, lastly, we come to the agreement.

Linking those four together, I say that the scheme shows that the view put forward by Lord Lloyd to this Committee was the correct view of what was intended. I accept every word of what Lord Lloyd said, and I go further, and say that the actual agreement entered into between the parties was this. Although I agree it was very curious, as the Chairman has said—most curious—I want to say, with regard to the things it was to do, and in the events which have turned out, it is difficult of construction; but when you look through the whole thing, the scheme, the intention of the scheme, Lord Lloyd's evidence, and what he said the scheme was intended to do, and the agreement that was in fact entered into, I say they all point to the fact that the ultimate result is that my client was in the position pointed out by Sir M. Visvesvaraya in the extract I read.

Mr. Billimoria.—May I request you kindly to add the interview which Sir George Buchanan had with the Secretary of State, as the fifth point in linking up those various points?

Sir H. Courthope-Munro.—I do not quite follow what that is.

Mr. Billimoria.—It is the interview which Sir George Buchanan had with the Secretary of State before the scheme was embarked upon.

Sir H. Courthope-Munroe.—What is your proposition upon that?

Chairman.—Mr. Billimoria wants you to recite the statement which Sir George Buchanan himself has given us. There is a rather important passage in it.

Mr. H. Courthorpe-Munroe.—Is that in Sir George's statement?

Chairman.—Yes. That is what is in your mind, Mr. Billimoria?

Mr. Billimoria.—Yes.

Sir H. Courthope-Munroe.—I should like the reference, as I am anxious to put every card there is on the table.

Mr. Melville.—I think it is at the bottom of page 50, the interview of 1920?

Mr. Billimoria.—That is it.

Sir H. Courthorpe-Munroe.—It is the interview with Mr. Montagu.

Chairman.—The particular passage Mr. Billimoria wants is about a third of the way down from the top of the page.

Sir H. Courthope-Munroe.—Perhaps I might read it, if Mr. Billimoria would like it read. It is Clause 59 of the statement made by Sir George Buchanan, and runs in this way: " On the 20th April, 1920, at an interview at the India Office with Mr. Montagu, Secretary of State for India, I presented a memorandum, of which the following are extracts, detailing the position of the Back Bay scheme up to date: the position when I left Bombay was as follows: The scheme, as prepared by myself, had received the approval of both the Government of Bombay and the Government of India."

Chairman.—I do not think that is the part. The passage which Mr. Billimoria wants is where Sir George Buchanan assured the Secretary of State that he would, if necessary, give up other work in order to give his full attention to this work.

Sir H. Courthope-Monroe.—Yes, I think I have it now. It is on page 50: " I then explained to him my position, namely, that after my scheme had been approved, Sir

George Lloyd had asked me whether my firm would be the engineers, as he did not wish the Bombay Public Works Department to have anything to do with the work. I had agreed on behalf of my firm, and had promised to make the carrying out of the work my principal object, if necessary declining work elsewhere, and I had agreed to go out and spend several months every winter in Bombay."

Mr. Billimoria.—Will you kindly link that up in the course of your argument with your other points? We should be very much obliged.

Sir H. Courthope-Munroe.—Certainly. Is there anything else you would like me to read?

Mr. Billimoria.—No.

Sir H. Courthope-Munroe.—To pursue my story, I do not think I can usefully refer again to Sir George's report of 1919, because we have discussed it almost *ad nauseam*.

Now I pass to what I think is a most important point, and that is with reference to this Bombay Housing and Development scheme. You ought to have that document in front of you.

Chairman.—What we have been working on really is the speech of Lord Lloyd on the 3rd August, 1920.

Sir H. Courthope-Munroe.—This apparently is the document, with the correspondence and so forth, that led up to the establishment of the Development Directorate; and it more or less indicates what, according to the intention of the Government, should be the duties of the various parties concerned. I am only concerned to draw attention to two passages of this document. The first is page 19, where you will find this, in paragraph 10: "The following *inter alia* shall fall within the scope of the Directorate's work. It should carry out the Back Bay Scheme, the East Colaba Scheme, and any other reclamation scheme which it may be found desirable to undertake in or near Bombay." There again, I pause to point out that, so far as I can see, these words "carry out," which is another way of saying "in detail," are found in the agreement, and they are found here, and they are found in the Rules and origin of the Development Department; and in no case, so far as I know, in the terms so far as Sir George's obligation is concerned. I suggest to you this expression "carry out" obviously means, when you come to look at the contract, the details. It means Mr. Lewis; it means the Resident Engineer; it means his deputy, staff and so forth.

Chairman.—Lord Lloyd read that passage in the speech of August, 1920, to which you have referred.

Sir H. Courthorpe-Munroe.—Thank you. You will forgive me if I go over the same ground, but we have got the thing to a head here; and we have to consider what in fact everybody thought was their duty, and what they were working in fact, and what is also the legal construction. If the legal construction turns out to be something different, under the terms of this extraordinary document, it is to go to an Arbitrator, who is to settle it for all time, and apparently with no appeal to anybody. I suggest when you come to look at it, what in fact was the conception of the parties concerned is the right conception; and Sir George's obligation and duty are limited in the way I suggest.

May I pass to the other passage, on page 37? There they are dealing with the formation of the Directorate of Development. This I think is a letter in which the Secretary of State gave his approval to that being done. It is from the Viceroy, the Finance Department, to the Secretary of State for India in London. He says: "Please refer to Education Secretary's letter No. 6, dated 26th February last, Bombay Housing and Development Scheme. We agree to the formation of a Directorate of Development" —this is the important part—"for the execution of the industrial housing scheme with the two reclamation schemes, Back Bay and East Colaba." As we know, that Department was established, and Sir Lawless Hepper was put in charge of it. I say this document itself shows that the Department came into being for the purpose of carrying out the scheme, and was charged with the execution of the scheme.

May I go now to the evidence given by Lord Lloyd? Lord Lloyd gave a good deal of evidence about it. In view of some answers that had been given to you by Sir Lawless Hepper, that he had no responsibility, or no practical responsibility, you put these questions to Lord Lloyd, which are on page 42 of Lord Lloyd's evidence. You say: "He"—that is Sir Lawless Hepper—"has disclaimed any suggestion that he was employed because of any technical knowledge. What do you say as to that? Then Lord Lloyd says: "I should not agree in those terms. Sir Lawless Hepper, if he had not been an engineer, and had had various other qualifications which seemed necessary for the task to which he was going to be put, probably would not have been appointed, speaking in general. Sir Lawless Hepper was selected as the Director of Development because the success of the Development scheme depended, to a very great extent, on the capacity of whoever was appointd at the head." What more weighty language can you have? Apparently it is suggested now that this gentleman who was appointed, and on whose capacity Lord Lloyd says to a very great extent the whole thing depended, can wash

his hands of the whole thing, and lay it down at the feet of my client. Let me go on: "The work, as you know, was of a very exceptional character, and its operations were on a very large scale. We had to combine in our Director a great many different qualities. It was necessary that the Director first of all should have a very close acquaintance with local conditions." That is something which Sir George could not have, by the nature of things. "We might have got somebody from America, or from a great distance, but it would have taken him two or three years in which to learn the local conditions. It was, therefore, considered important that we should get a man who already knew the local conditions." Then comes point No. 2: "It was very important that he should understand traction and transit problems, because the whole of that Island problem (not the whole of it, but a large part of it) is a traction problem. He (that is Sir Lawless Hepper) had those two qualifications in a very high degree. He knew the place intimately. He was acquainted with traction problems, as you have just pointed out. He had had a distinguished career as a Railway Engineer, and he was then holding a very important post on the railway, as you have also pointed out." I understand he was General Manager of the Great India Peninsular Railway. "He had been further proved during the war by his work as the Local Controller of Munitions, and he stood, I think I can say, exceptionally high in the estimation of the Government of India, and what was also of great importance, he stood very high in the estimation of the public of Bombay. We had to raise public loans, and it was very important that the Director of these works should have the confidence of the public from whom we were asking the money. The local public, in a narrower sense, had great confidence in him. As a Railway agent, as Member of the Port Trust and City Improvement Trust, he was very well acquainted with all the local conditions, and, combining those four qualifications, he seemed to be almost unique in experience for that particular post. Those were the conditions which led to his appointment, therefore to some extent his engineering, in a general sense, was a qualification—not very specific." Then missing a question, you put this question: "Was Sir Lawless Hepper the person responsible for the carrying out of the works in Back Bay, or were Messrs. Meik and Buchanan, or Sir George Buchanan, responsible for it?" Then Lord Lloyd very properly says this: "That is not a question to which can be answered Yes or No. You have taken a great deal of evidence on this question, and perhaps it would be better if I described to you what were his functions." Then you say: "Will you please tell us the organisation of the Development Directorate, and then if you please, tell us with regard to Sir Lawless Hepper's special position." Then the answer is this: "I will do my best. In describing the duties of Sir Lawless Hepper, and his relation to the local Government, it is necessary to distinguish between the Secretariat Department and the Executive organisation, as a matter of fact the term 'Development Department' I notice has been used to cover both. The Secretariat Department, for any activity of Government, is the organisation which deals with the business which comes before Government, and through which they issue their orders. I think that is natural and plain. The Secretary is the principal of the Department, responsible to Government for the conduct of business, and for the issue of their orders. He is the channel, but the Secretary as such (and anyone familiar with the organisation in India will know it) has no executive powers. The Executive is usually a separate organisation presided over by a separate officer, often known as the head of the Department. In this case which we are discussing, the Executive Department was known as the Development Directorate, and its head is the Director. I can give you a suitable analogy in the case of Public Instruction in India. There is a Secretary to Government for Education, which is the channel through which Government deals with Education; and the Executive head of the Department is the Director of Public Instruction. I hope I have made the position clear. The Secretary to Government in the Development Department was also the deputy of the Director in the Executive Department. Is that quite plain?" Then he goes on to say this: "Sir Lawless Hepper's relations to the local Government, generally speaking, are the same as those of the head of any other Department. Any difference was largely in the exercise of discretion. In the Back Bay reclamation scheme his functions were qualified by the agreement with Meik & Buchanan, who ultimately became responsible for performing the work and duties set forth in that agreement." That is the point. I do not want to avoid one iota of my responsibility under the agreement; but everybody seems to have assumed that had put the agreement aside. "You are responsible for the whole thing." Anything within the four corners of the agreement I do feel a responsibility for; and that is all Lord Lloyd points out Meik & Buchanan are responsible for. Then he says "I need not recite the terms of the agreement, because they are before you." This is the text, the important part, which I am now coming to. Then Lord Lloyd says: "Messrs. Meik & Buchanan designed the work." I pause there to say for any fault in design, in estimates or things of that kind that are within the province of Sir George, he is answerable for and responsible for. Then Lord Lloyd goes on to say: "And the director"—that is Sir Lawless Hepper —"was responsible to Government for ensuring that the works were carried out

according to the firm's design by the Chief Engineer." Mark that again—mark the words "carried out". They are in the agreement and in the scheme—" to carry out ". " The director was responsible to Government for ensuring that the works were carried out according to the firm's designs by the Chief Engineer." The word used there is " Chief ", but in the agreement it is the same or synonymous with the one who is called the Resident Engineer. " The programme of the work was set forth from time to time by Sir George Buchanan. The relations of Sir George Buchanan and Sir Lawless Hepper to Government might be described in general terms by saying that the former was responsible for the strategy and the latter for the tactics of the scheme." I do not know whether we have any military member on the Committee, but Lord Lloyd put it in that way. " The Director was responsible, for example, for organising the staff, though the principal appointments required the orders of Government, while the Chief Engineer's appointment "—that would be Mr. Lewis—" was subject to the nomination of Sir George Buchanan." Then he says: " These were not watertight compartments, and that is the difficulty of answering your question absolutely precisely. In no great organisation can it be so. The staff recruited in England was engaged by the India Office, or by the High Commissioner's Office, and the selections were usually made on the recommendation of Sir George Buchanan." May I pause there to clear up one matter? It was pointed out yesterday by Sir Frederick Hopkinson that as he conceives it, it was the duty and obligation of Sir George Buchanan to know all the men who went out to work the dredgers.

Sir Frederick Hopkinson.—No, not that, but how many there were—not to know them personally, but to know how many there were.

Sir H. Courthope-Munroe.—I agree. I want to point out and make a strong point of this. When I come to the agreement you will find that Sir George Buchanan's power to nominate anybody or to have any concern with anybody who was selected by the Indian Government began and ended with two persons, the Resident Engineer and the Deputy Resident Engineer. In point of fact he nominated those two gentlemen. One at a certain stage retired, and then I think he nominated a third. As regards those three persons he was, by his contractual obligation, bound to nominate and honestly nominate them, and do the best he could, but anything else he did was merely done by kindness and by way of endeavouring to further the best objects of the scheme. It is altogether wrong to suggest that because he was asked " Do you recommend A, B or C? " that he had not a duty in the matter a all. He honestly performed his duty when his contractual obligation began and ended with the nomination of these two people.

Now I pass on. Lord Lloyd continues: " The Director "—that is Sir Lawless Hepper—" was also largely responsible for obtaining plant according to the plans and specifications of Sir George Buchanan." Then Lord Lloyd said he thought that the Director was " the Government watchdog," in face of the disclaimer by Sir Lawless Hepper of any responsibility so far as I can see, and suggesting that everything should be laid at the door of Sir George. What is the meaning of that—" he is the Government watchdog "? When I come to deal with the ordinary terms of contract you will find the so-called watchdog in the engineering profession is invariably the Resident Engineer. Here you have somebody put up over his head who is described in apt language as " the Government watchdog." Then, says Lord Lloyd: " That was his main function. It was his duty to see that the organisation was working efficiently and economically. Any departure from the technical proposals of Sir George Buchanan, or any proposed action in disagreement with the latter, would have been referred presumably for their orders. That is about as precise as I can give you, the relations between Sir George Buchanan and the Director of the Development Department. Does that in any way answer your question? " I do not think I need read any more of that. I think that covers the ground. Could you get anything more clear or more distinct as to what Lord Lloyd intended to be the respective duties of the parties? If I read that rightly, the whole of the execution, the whole of the carrying out, the whole of the watching, the whole of the economical working and smooth working were to be carried out by the Department. On the top of that you have a gentleman who is described as the Government watchdog. In the events that have happened the watchdog appears to have retired, and the responsibility for everything that has happened, so far as I can see, is laid at my client's door. That is why at this eleventh hour I am only too glad to be in a position to try and come to close quarters with what the agreement means.

Having got the intention of the scheme, the scheme authorised by the Viceroy, having got Lord Lloyd's view of what the scheme was intended to carry out, let me now go to this document.

Mr. Billimoria.—Before you proceed further, may I just put one point?

Sir H. Courthorpe-Munroe.—I am much obliged to you.

Mr. Billimoria.—You are emphasising the word " carry out."-

Sir H. Courthope-Munroe.—I am coming to that; I have not done with it yet.

Mr. Billimoria.—Could you draw any distinction between carrying out and execution? What is the distinction or line of difference between the two?

Sir H. Courthope-Munroe.—We shall have a lot of talk about the actual meaning of the words when we come to the agreement. Before I start endeavouring to elucidate the true meaning of this agreement, which I agree is a curious one, most unusual and wants careful consideration, I think it will assist the Committee if they will let me outline what is the ordinary agreement which is entered into for public works as executed abroad, where you have got consulting engineers in London and you have got a Resident Engineer in charge of the local works. If you will be good enough to look at that document I think it will assist you to try and follow what I am putting to the Committee. (*Document handed in*). I have only put it down in that form in order to try and bring home to the minds of the Committee, some of whose members may not be familiar with the position what is the ordinary example of such an agreement. You may like to look in this connection at a case which I have found, which is commonly known as the Brazil case, which is the case of large works which were being executed in Brazil with a London engineer. There they deal with the position of Resident Engineer and emphasise his independent position. The only report of the case so far as I know is in Hudson's Building Contracts, Volume 2, page 18. It went to the Court of Appeal. It is headed " In the Matter of an Arbitration between Snell & Co. and the Rio de Janeiro Flour Mills and Granaries, Limited." I only mention the case because these cases so rarely find their way into the Courts, as they are nearly always dealt with by arbitration. But this is a case which travelled up so far as the Court of Appeal, and was considered by Lord Coleridge, Mr. Justice Mathew (a great commercial Judge), Lord Esher and Lord Justice Fry. There is in that case a form of contract which is more or less the form of contract which obtains in connection with big works abroad which are supervised by the engineer in London with the Resident Engineer in charge. I will hand that to you later.

Let us just take the ordinary case of any large private contract abroad. In every such case you have the building owner to start with; then you have the engineer, who, for reference purposes, I call the principal engineer, to distinguish him from the Resident Engineer, and the people who are doing the work on the spot. His duty is to make plans and specifications, and then to supervise. When he supervises he inspects and deals with the reports of his agent. It is his agent, mark that, not somebody else's agent, but his agent, the Resident Engineer. He approves the work and gives certificates on which alone payment is made. That is the man in London. The next person in the chain is the Resident Engineer abroad, who is nominated by and under the sole control of the principal engineer. He superintends details, and reports to his principal. To emphasise that may I just read one paragraph in the professional rules of the Association of Consulting Engineers? This is the point which all engineers lay the greatest stress upon : " The engineer alone, and not the client, can have authority to give instructions to the contractor, Resident Engineer, Clerk of the Works, and Inspectors on all works done to the engineer's specifications or drawings." Under these contracts, as I say, this Resident Engineer is under the sole control of the principal engineer. What does he do? He superintends the details, and writes to his principal. I invite the Committee at this stage—because I must deal with it at somewhat greater lengths when I come to the contract itself—to observe that there is a vast distinction between the words " supervise " and " superintend.". I want you to grasp that and not to think that I am playing with words as a mere lawyer; all these things have professionally a distinct and well-defined meaning.

Sir Frederick Hopkinson.—But the case you are assuming now is the case where a contractor is employed?

Sir H. Courthope-Munroe.—Yes, obviously. No one is more familiar with that than yourself. I am taking the case of a contractor. Lastly in the chain, you have the contractor who does the work. This result arises from working out in Westminster the working of these contracts—to provide an effective check on the expenditure and a guarantee that the work is properly done. The effect of all this is that not one penny piece can be got by the contractor except with the approval of the principal engineer, who grants his certificate, as Sir Frederick well knows, after he has had his reports from his Resident Engineer. That is the safeguard. That is, I venture to say (and I invite any criticism), the scheme of an ordinary private contract for big works that are done abroad, work in many cases involving very large sums of money though not so big as in this case.

Let us see what this contract has done. The building owner in this case is the Bombay Government working through the Secretary of State of India. He takes the place of the building owner. The engineer—I have struck out the word " principal "

because the word " engineer " is the only word that actually appears in the document, but I mean the consulting engineer—in this case is Sir George Buchanan. The Resident Engineer in this case is made absolutely independent of the principal engineer. That is the keynote of the whole thing. He is under no obligation to make any reports, and all the principal's instructions, as you will see when I come to deal with them, are all controlled by the Departments. No reports had to be made by the Resident Engineer. He is not the servant of the principal engineer; he does not pay him, and he cannot dismiss him. The principal engineer has to give no certificates for the execution of the work, and he is in no way concerned, unhappily, with the value of the work done. The Resident Engineer, who, as I have told you, in the case of an ordinary contract is, if I may use the expression, the alter ego, the eyes of the man in London, in this contract is placed entirely independent of any control of the engineer in London. But he is put under the control of the Department. He is paid directly by the Government, and is dismissable by the Government. If one may refer to the expression which has been used, " watchdog," in every ordinary contract the watchdog is the Resident Engineer. But for his reports no certificates will be granted by the principal engineer in London. There is the safeguard. You cannot get a penny piece except you work up in that way. The effect of this arrangement is absolutely to short circuit all that scheme, because you find, when I come to the last stage, the contracting stage, all that is represented by the Director of Development and his staff. All check on the expenditure by the principal engineer or any guarantee as to the value of the work done is entirely cut out. You have the Bombay Government, the employer, in direct communication with the Director of Development and his staff, who take the place of the contractor, and you have got what Sir Frederick Hopkinson, I think, ridiculed, and I think very fairly ridiculed when the evidence was being given. You have got this regular scheme, and then you have this extraordinary scheme which was evolved for the work of this particular contract. You short circuit all the guardianship of the principal engineer and the Resident Engineer. You put the employer who is doing the work in direct communication with the Department who are spending the money. You short circuit these people, and you work upon a system—I am disposed to use the language which was used by Sir Frederick Hopkinson when he called it a comic opera performance. " Then you come to the question of who makes these project accounts. It seems to me rather a comic opera performance, because the man who makes the project estimate is the man who is going to carry out the work.—(A.) That is true. (Q.) Therefore he would be more than human if he cut his prices down?—(A.) Exactly, I agree. (Q.) If he cut his prices down and the work cost a little more than his estimate showed, he would get into serious trouble?—(A.) He would. (Q.) If he put his prices twice as much as he need, and he did it with three-quarters, he would be considered a more or less reliable man?—(A.) I quite agree. (Q.) Although the work might have cost 50 per cent. more than it ought to have cost?—(A.) Yes."

Sir Frederick Hopkinson.—That was intended to apply not only to the Back Bay reclamation scheme, but to the whole of the Public Works Department. It is a general comment.

Sir H. Courthope-Munroe.—I agree. To anybody who is conversant with these things it is too obvious. I think if one just considers the position between what I may call the ordinary type of contract and the ordinary safeguards which the evolution of time and the ability of lawyers and the ability of engineers has evolved, and, comparing it with this contract which was entered into, one has not far to travel to find out why this enormous waste of money has taken place.

Let me go at this stage to the actual document, the agreement. The agreement runs in these terms: " Memorandum of agreement made this seventeenth day of March, nineteen hundred and twenty-one, between Charles Scott Meik and Sir George Cunningham Buchanan, K.C.I.E., carrying on business as civil engineers in partnership under the name of Messrs. C. S. Meik & Buchanan, at 16, Victoria Street, Westminster, in the County of London (hereinafter called ' the firm,' which expression shall include the said Charles Scott Meik and Sir George Cunningham Buchanan and their successors being partners in the firm, and their and each of their respective executors and administrators)," of the one part, and then the second part: " The Secretary of State for India in Council (hereinafter called ' the Secretary of State ')." Then it recites that the Secretary of State: " is about to carry out a scheme for the reclamation of a part of Back Bay, Bombay, which is known as the Back Bay Reclamation Scheme, and it comprises the whole of the works described in the report made by Sir George Cunningham Buchanan." Then this is the material recital which we now come to: " And whereas the firm have been engaged by the Secretary of State as engineers of the Back Bay Reclamation Scheme and of all works in connection therewith upon the terms hereinafter mentioned." I pause to point out that these gentlemen were engaged as engineers. They were not engaged as quarry masters or as persons in charge of barge operations, but they were engaged as engineers. Then the agreement

goes on: "Now it is hereby agreed as follows: (1) The firm agree to act as the engineers of the Secretary of State in carrying out the said scheme and in the construction and execution of all works connected therewith (hereinafter referred to as 'the works') until the final completion thereof, and the firm shall at all times assist and advise the Government of Bombay in all matters relating to the execution of the works, and shall supervise the same and undertake and perform all work and duties devolving upon engineers of large works." Again, I lay emphasis upon that, and I also call the attention of the Committee to the fact that it says, "and shall supervise." I am going to draw attention in a moment to the definitions. If one may paraphrase it, that means "inspect and report." It does not mean, as Sir Frederick Hopkinson was good enough to suggest, that we should go on board the dredger and stop there till it worked properly—it means nothing of the kind.

Chairman.—It was I who made that suggestion.

Sir Harry Courthope-Munroe.—Forgive me, you may have made it also.

Chairman.—I undoubtedly made it.

Sir Harry Courthope-Munroe.—It was pressed to this extreme limit by Sir Frederick Hopkinson yesterday, and I want to deal with it. He said, when dealing with this everlasting question of the working of the dredger, which we all agree is the crux of the thing, according to my note, and I can check it with the Shorthand Notes: "You ought to have stayed on the dredger until the results were achieved." That is what Sir Frederick said yesterday.

Sir Frederick Hopkinson.—Prefacing it by saying: "Or find out why they were not being achieved."

Sir Harry Courthope-Munroe.—Speaking as a man of the world, not as a contractor or a lawyer, I agree.

Sir Frederick Hopkinson.—Of course you do.

Sir Harry Courthope-Munroe.—But the question we are discussing here is not whether it ought not to have been done, but who ought to have done it. I do not quarrel with the question as a question, except in relation to its being put to Sir George.

Chairman.—The other way of putting it which you are suggesting is whether there is to be found in the four corners of this agreement the legal duty to do it.

Sir Harry Courthope-Munroe.—Yes; and if I may venture to say so, I go even higher than that. I do not want it to go forth to the world that we, in this matter, are sitting tight upon our legal rights. I say no human being can gather from this document any moral obligation to do it. How can it be said for a moment that a gentleman in the position of Sir George, who has got works all over the world, and who admittedly lives in London, where the execution of the works and the carrying out of the works are upon the very terms of the scheme to be done by the Directorate, that it is any portion of his duty to get on board this dredger and stay there till it works properly?

Sir Frederick Hopkinson.—That would come under a moral obligation.

Sir Harry Courthope-Munroe.—Well, I should doubt it. How could it?

Chairman.—Sir George Buchanan being in Bombay, and being the great expert, might well have conceived it his duty to go on board the dredger and find out exactly what was happening, and might well have conceived it his duty to go to Malabar Hill and have a conference.

Sir M. Visvesvaraya.—I may add that he is also expected to devote the greater part of his time, under the agreement, to this particular work.

Sir Harry Courthope-Munroe.—I want to take it by steps. I do not for a moment want to avoid anything at all.

Chairman.—You had got down to the work in England.

Sir Harry Courthope-Munroe.—Yes: "Devolving upon engineers of large works."

Mr. Billimoria.—Before we proceed to "work in England," where is the distinction drawn between the "execution of all the works" and "the carrying out of the works." What is the difference?

Sir Harry Courthope-Munroe.—I want to answer your question. What is your question again?

Mr. Billimoria.—Taking the first line of the paragraph: "In carrying out the said scheme and in the construction and execution of all works connected therewith." What is the distinction you draw between "execution" and "carrying out" of all the works?

Sir Frederick Hopkinson.—It occurs again in the fifth line: "the execution of the works."

Mr. Billimoria.—Will you kindly enlighten us on that?

Sir Harry Courthope-Munroe.—" In carrying out the said scheme," and " in the construction and execution of all works "—it is all controlled by the word " engineers."

Chairman.—Is that your point?

Mr. Billimoria.—That is my point.

Chairman.—You say that the whole of that clause is governed by " The firm agree to act as the engineers "—as engineers in carrying out, as engineers in the construction and execution of all works, and shall supervise the same as engineers and undertake and perform all work and duties devolving upon engineers—which means : " ordinarily devolving upon engineers."

Sir Harry Courthope-Munroe.—That is it.

Chairman.—You say the whole thing is governed by the phrase " as engineers "?

Mr. Billimoria.—If it is the word " engineers," that is one thing; but the expression here is " the engineers." It is more emphatic. It is not only " engineers," but " the engineers."

Sir Harry Courthope-Munroe.—As a lawyer, I hope I shall not try to avoid responsibility by looking at this document as closely as that. It is a rule that you will agree to at once, I think, that the meaning of general words in an agreement must be construed with regard to the text of the document. You have to find it within the four corners. If you find here and there a word which is of somewhat doubtful meaning you must construe that by reference to the whole context of the document. That is elementary from a lawyer's point of view. Let me go on. That is what they are to do as engineers. Then the document turns to " Work in England " : " (*a*) The preparation of the working drawings, specifications, schedules of quantities and rates and estimates of cost for the whole of the work included in the report of Sir George Cunningham Buchanan." May I get rid of the document, which has been called the modification which was agreed to on the 13th January, 1923, by saying if you write in four or five words into Clause (*a*) you give effect to that document? Paragraph (*a*) should read in this way now in consequence of that modification, and you will check me on this : " The preparation of the working drawings, specifications, schedules of quantities and rates and estimates of cost for the whole of," insert the word " permanent " : " work," and then add : " and storm water drains " : " included in the report of Sir George Buchanan." If you insert those words you have given effect to this modification as far as it affects the agreement, and I need not weary the Committee by reading all through this. That is the effect of this modification. Then the agreement goes on to say : " And such work shall be commenced forthwith, and all such drawings, specifications, schedules of estimates and any fresh or amended drawings, specifications, schedules of quantities and rates and estimates as may from time to time be required during the progress of the works shall be promptly prepared and forwarded to the Government of Bombay, and shall become the property of the Secretary of State." There is no quarrel on that at all. Then Clause (*b*) is : " The approval in conference and in conjunction with the consulting naval architect to the Secretary of State of the detailed drawings and specifications of the dredger and floating pipe line, and the final inspection and supervision of tests and trials "—you observe those latter words. I only pause there to say that there is nothing whatever to show or suggest that what Sir George says is the usual practice; namely, to test at the place of manufacture, coupled with the firm's guarantee, or coupled with their representation as to the working capacity of what they are supplying is to be departed from, or to suggest that the test is to be in Bombay.

Chairman.—On the contrary, it is headed " Work in England."

Sir Harry Courthope-Munroe.—If you please. That emphasises it. It says : " The final inspection and supervision of tests and trials."

Sir Frederick Hopkinson.—In accordance with the contract.

Sir Harry Courthope-Munroe.—Yes; I merely point that out. In the light of events, if one could look ahead and forecast all the hundred-and-one things that are going to happen when one drew contracts, one would dot one's i's and cross one's t's, and put in a great deal more than one does.

Then we go to (*c*) : " The approval in conference and in conjunction with the consulting naval architect to the Secretary of State of the detailed drawings and specifications of intermediate pumping stations, shore pipes, and the general inspection and trials of the same. Then (*d*) is : " The preparation of plans and specifications for all other plant required in connection with the construction of the works and the inspection of such plant and any material required for the works prior to shipment."

I pause there to point out this. Obviously, on the true meaning of these paragraphs, the dredger is plant.

Sir Frederick Hopkinson.—May I interpose here a moment, and point out to you that this provision in (*d*) is not required where such contracts as you have been speaking of, foreign contracts, are carried out by an engineer through a firm of contractors? The engineer never in those cases draws the plans and specifications for plant.

Sir Harry Courthope-Munroe.—I am not prepared to cross swords with you on that.

Sir Frederick Hopkinson.—That is so. The contractor is left to his own devices.

Sir Harry Courthope-Munroe.— I am only endeavouring to point out this. I start with agreeing with the learned Chairman that this is a curious and difficult document to construe, and quite an unusual one; but we have to get down to bedrock now and endeavour to find out what it does mean. I suggest here on the true construction of (*c*) and (*d*) the dredger is plant, and there is no provision made for the " inspection of plant and material required for the works prior to shipment."

Chairman.—What Sir Frederick Hopkinson is pointing out is that ordinarily an engineer would have nothing to do with any plant. That is for the contractor. If it happens that the contractor brings upon the proposed site plant that is not effective, then the engineer says: " Take it away."

Sir Harry Courthope-Munroe.—I quite agree.

Chairman.—As regards the actual provision of the plant the engineer does not trouble about that in the slightest degree. It is up to the contractor to provide himself with such plant as will enable him to do the work within the specified time—such plant as satisfies the engineer or the resident engineer.

Sir Harry Courthope Monroe.—I quite agree. I am not disputing that for a moment.

Chairman.—That is the whole point.

Sir Frederick Hopkinson.—That is the whole point.

Chairman.—That is why this may be a hybrid agreement.

Sir Harry Courthope-Munroe.—I quite agree.

Sir Frederick Hopkinson.—You will remember also that I pointed out to Sir George Buchanan some days ago twelve works that he had done in connection with this scheme which are not ordinarily done by the chief engineer, but are always left to the contractor.

Sir Harry Courthope-Munroe.—Yes.

Sir Frederick Hopkinson.—Which separates the position as it exists in Bombay from the cases you have given, such as the Brazil case.

Sir Harry Courthope-Munroe.—Yes.

Sir George Buchanan.—I think I can clear up that point.

Sir Harry Courthope-Munroe.—I do not think you had better take a hand in it at this stage.

Chairman.—You can just make a note of it, Sir George, and deal with it later on.

Sir George Buchanan.—Very well.

Sir Harry Courthope-Munroe.—All I want to point out is this. These paragraphs deal with plant, and I quite agree with what Sir Frederick Hopkinson has said about it, that in the ordinary course it is the contractor's job and not the engineer's; but Lord Lloyd points out the Director, that is in effect the contractor, according to my contention, was also largely responsible for obtaining the plant according to the specification.

Sir Frederick Hopkinson.—Not designing it, but obtaining it.

Sir Harry Courthope-Munroe.—I will leave out " obtaining the plant according to plans and specifications of Sir George Buchanan." In this case the contractor, the Director of Development, was obtaining the plant. It is quite true that we designed that plant. If, and so far as any fault can be found with the designing or with what Sir George Buchanan had undertaken to do, I agree that he is personally responsible; but it is not exactly the same position. Here the Development Department took the place of the contractors, and it was their job, and their job alone, says Lord Lloyd, to obtain the plant. That is how I deal with that. Lastly, Clause (*e*) is: " Correspondence of the Government of Bombay or any officer deputed to act on their behalf, including any reports from time to time required by Government in respect of the dredger plant, or material, or the progress of the woks.

Then I go to " Work in India," and this is very very important: " During the whole period of execution the works shall be closely supervised by the firm." I pause there to deal with this point. It is essential to get a clear understanding of what this

word " supervise " means. I have looked into the professional dictionaries and other dictionaries to find out what is the fair meaning to be given to the word " supervise." I direct your attention to what I believe is the fact, that you will not find in the whole document, certainly not as far as Sir George is concerned, the word " superintend." The primary meaning of the word " supervise " in Sir James Murray's dictionary—the primary meaning is what I am concerned with—is " to look over, survey, inspect." That is the primary meaning of the word supervise. The word " superintend," which is an apt word to describe the duties of an ordinary Resident Engineer, is defined in the same dictionary in its primary meaning as " To have or exercise the charge or direction of operations or affairs." In the course of one's researches I found an illuminating note in the Century Dictionary on the word " supervise " which I venture to think is very applicable to this case. The Century Dictionary points out that the word " supervise " often implies a more general care with less attention to and direction of details than the word " superintend." That exactly bears out what I say. If one may venture in a legal document to paraphrase a word, the best meaning I can give to the word " supervise " is that it does not mean superintend, but it does mean inspect and report —inspect rather.

Chairman.—Where do you get " report "? You said " inspect and report."

Sir H. Courthope-Munroe.—I do not get that word, I agree.

Chairman.—" Supervise " comes from " super " and " video."

Sir H. Courthope-Munroe.—Yes. Report follows in connection with duties, I agree, but I get " inspect." " And Sir George Cunningham Buchanan shall devote the greater part of his time to this particular work." This is the point which Mr. Billimoria was putting to me, and may I endeavour to meet the point? I pause there to point out this. It does not say that he is to give the greater part of his time in India to the work.

Sir Frederick Hopkinson.—But it is all under the words " Work in India."

Sir H. Courthope-Munroe.—I agree, but you have to look at the context. If the fair reading of this document is that Sir George Buchanan is to devote the greater part of his time to the work in India, cadit quastio, but is that the meaning? What it means is that he is to give the greater part of his time to this particular work. Now let me go on: " And shall, unless the Bombay Government agree otherwise, visit Bombay this year and in every year after the monsoon when the working season begins, and remain in Bombay for such period during the working season as he or the Government of Bombay may consider necessary to ensure the complete and satisfactory supervision of the works, and shall also, if necessary in his own opinion or in the opinion of the Government of Bombay, make additional visits during any monsoon." Let me take that word for word. What is the obligation? He shall " visit Bombay this year and in every year after the monsoon when the working season begins, and remain in Bombay for such period during the working season as he may consider necessary." I take up this position most strongly. Short of malafides on the part of Sir George (which I do not think anybody can suggest) on that agreement he, and he alone, is the judge as to whether he should stop there 10 days, 20 days or 30 days, or three months, and nobody else is judge.

Sir Frederick Hopkinson.—But it says: " He or the Government of Bombay."

Sir H. Courthope-Munroe.—If you suggest malafides then I agree, but on a fair reading of that document it is obvious that he is the party to judge.

Sir Frederick Hopkinson.—Or the Government of Bombay.

Sir H. Courthope-Munroe.—I will come to that in a moment; I am taking it by steps.

Mr. Billimoria.—" To ensure the complete and satisfactory supervision of the works."

Sir H. Courthope-Munroe.—I agree, but I must endeavour to take it stage by stage. If one was to decide (which I do not think is suggested) that it was a case of malafides or intention to do anything wrong, then I agree, but once you assume that the man is acting honestly in good faith, it is not open to anybody to say: " 10 days, why you ought to have stopped there three weeks." " Three weeks, why you ought to have stopped there three months."

Chairman.—The question must be, when he went away did he in fact go away before he had completely and satisfactory supervised the work?

Sir H. Courthope-Munroe.—In his opinion?

Chairman.—Yes.

Sir H. Courthope-Munroe.—Given those conditions, I agree entirely. Now let me pass to the next matter. Sir George has given you his evidence, and if my memory serves me rightly it was capped by an apt illustration by the Chairman: one learned

counsel might do in three weeks what another might take three months, and what another might take six months to do and never arrive at any result at all. That is common knowledge. Let me go on to the next paragraph: "As he or the Government of Bombay may consider necessary to ensure the complete and satisfactory supervision of the works." Stopping there, notice it says, "as the Government of Bombay may consider necessary." Once and once only was Sir George asked to remain on, and he did so. In every other case when he left Bombay the Government wished him "God speed." How could it be possibly said many years afterwards that the Government should consider it necessary that he should do otherwise than he did?

Chairman.—There is no evidence that he ever left Bombay in defiance of the wishes of the Government.

Sir H. Courthope-Munroe.—That is what I say.

Chairman.—There is no doubt about that.

Sir H. Courthope-Munroe.—It is carried a little bit further by the fact that on one occasion when he was asked by the Government to remain, he did so.

Sir George Buchanan.—To make a special visit in the monsoon?

Sir H. Courthope-Munroe.—Yes, a special visit.

Chairman.—You went there in July?

Sir George Buchanan.—Yes.

Sir Frederick Hopkinson.—To see the effect of the monsoon?

Chairman.—That is right.

Sir H. Courthope-Munroe.—I venture to put it that the Committee should be thoroughly satisfied that that paragraph 1 has been loyally followed by Sir George, and there is no right to lay at his door any neglect of his duty or any neglect of his obligation at all in respect of that. It seems to me perfectly obvious if he acts *bona fide*, the time he gives to the matter is entirely a matter for his good judgment.

Mr. Billimoria.—Would you call it an error of judgment if there was a lack of supervision? Taking a *bona fide* case, if he did not stay long enough to ensure complete and satisfactory supervision of the works, would you call that an error of judgment?

Sir H. Courthope-Munroe.—Before I answer the question let me see that I understand it. Do you mean to say could a person have properly supervised if he was negligent? No; I should answer that question by saying he could not.

Chairman.—Take an extreme case to meet Mr. Billimoria's point. Supposing as soon as he arrived in Bombay—I am not suggesting that he did this for one moment, you know.

Sir H. Courthope-Munroe.—I am obliged for the argument.

Chairman.—Assuming he arrived in Bombay and he spent a couple of days looking round the place, and then he went to a Christmas camp for 10 days, and then came back and played about in Bombay socially for four or five days, and then took the steamer home, he would not have done his duty?

Sir Courthope-Munroe.—Obviously.

Chairman.—That is your point?

Mr. Billimoria.—Yes.

Sir H. Courthope-Munroe.—It would be obviously ridiculous. You would then find he had not properly supervised. I would put it even higher. If a man undertakes to do work and is obviously guilty of gross negligence in the work, he is not supervising it—he is not doing his job.

Chairman.—That meets your point?

Mr. Billimoria.—Yes.

Sir H. Courthope-Munroe.—I am very glad that question should have been put to me so that I may endeavour to meet it. Now let me go to paragraph 2: "If the Government of Bombay shall from time to time require any alterations in the works before or after the commencement thereof or shall require any additional works to be executed, all work required to be done in connection therewith shall be in the duty of the firm under the preceding clause." I do not think there is any dispute about that.

Chairman.—You had better make the point that I take it your construction of that is that the work is work of supervision. All work required to be done is work of supervision, is it not?

Sir H. Courthope-Munroe.—Yes, I think so.

Chairman.—That is if they throw in any additional work, the same duty applies as regards the additional work as applies to the original work?

Sir H. Courthope-Munroe.—Exactly. Whatever that duty may be, the same duty applies to the additional work.

Chairman.—To see what it is you have to refer to the preceding clause.

Sir H. Courthope-Munroe.—I agree. Now I come to the next clause, where we really get down to the real point.

Sir Frederick Hopkinson.—Where the moorum is.

Sir H. Courthope-Munroe.—It is a matter which one has very carefully to consider. Before I read this I ask the Committee to strongly bear in mind the ordinary position of a Resident Engineer, with which no one is better familiar than Sir Frederick Hopkinson. This is paragraph 3: " A Resident Engineer and also a Deputy Resident Engineer (if required, and if his appointment is approved by the Government of Bombay) will be nominated by the firm and will carry out the details of the works in accordance with the firm's instructions, but subject to the control of the Director of Development or other officer appointed by the Government of Bombay, and they, as well as the whole of the staff, both engineering and clerical, employed in India in connection with the works, will be paid by the Government in Bombay." Let us tackle that bit by bit. As I ventured to point out, there is no obligation put in the agreement upon Sir George to nominate or be responsible for anybody at all except the Resident Engineer and the Deputy Resident Engineer. In point of fact he nominated Mr. Lewis. Having said that I pass from that because we have discussed all that. Also he nominated the Deputy Resident Engineer, Mr. Elgee.

Chairman.—Mr. Brims and Mr. Elgee.

Sir H. Courthope-Munroe.—He was to nominate these two people. In point of fact he did nominate these two people. Then Mr. Lewis fell out and he nominated a third man to be Deputy Resident Engineer.

Chairman.—He did not nominate Mr. Elgee. What happened was, he put an advertisement in " The Times " at the request of the Director of Development, and Mr. Elgee replied. There were several other applicants. Sir George Buchanan, having read all the applications, said he thought Mr. Elgee was the best man, and in that way the matter went through.

Sir H. Courthope-Munroe.—If you please, I do not want to stress it or labour it in any way, but I want to meet the suggestion that every person that Sir George Buchanan may have recommended and said " He is the right man " he is, from beginning to end, responsible for. According to the law—and here one again gets it from Hudson—the mere nomination of a man, if you honestly nominate him and are acting in good faith and not in bad faith, is an end of the matter—there is no legal obligation in fact in any shape or form. In this case an attempt is being made, if I follow the matter rightly, to suggest that all these actions which were done out of mere good nature and an endeavour to advance things were all actions for which Sir George is liable down to the bitter end.

Chairman.—What are you referring to when you say " all these actions "?

Sir H. Courthope-Munroe.—I cannot get out of my head what Sir Frederick is putting to him when he said, taking the crew that came out from London: " You ought to have known them all." I suggest that nomination does not involve a knowledge of the crew, but I may have misunderstood Sir Frederick.

Chairman.—I think that the particular point that Sir Frederick Hopkinson was on is this: the whole scheme hinged on the pumping hours being 15 hours a day.

Sir H. Courthope-Munroe.—Good.

Chairman.—Sir George Buchanan in his report had said that two shifts should be worked. I do not think Sir Frederick Hopkinson's questions were directed to anything more than pointing out that Sir George Buchanan must have known there were not two shifts being employed, because the personnel had not been engaged. That is it, is it not?

Sir Frederick Hopkinson.—That is it.

Chairman.—That is all; you need not labour that.

Sir Frederick Hopkinson.—That is all I meant.

Chairman.—When you get to the third line of this clause then we get to grips in the matter.

Sir H. Courthope-Munroe.—" And will carry out the details of the works in accordance with the firm's instructions." There this agreement is in exact accord with what Lord Lloyd said. It is in exact accord with the document that I read to you, which is the scheme. Who is to carry it out? A multitude of questions have been put, all perfectly good questions if put to the right person, but, being put to Sir George, they have astonished me. The person to carry out the details if the work is the Director of Development.

Chairman.—The Resident Engineer, according to this?

Sir H. Courthope-Munroe.—Yes, the Resident Engineer, but under the control of the Director. You will see that a little later on. I am not here in any sense palliating all this wicked waste of money that has gone on, and the gross neglect, but what I do respectfully suggest is, that it is monstrous in the terms of this paragraph 3 to lay this at the feet of Sir George. The Resident Engineer and also the Deputy Resident Engineer " will carry out the details of the works."

Sir Frederick Hopkinson.—As instructed by the Chief Engineer. It is the Engineer's instructions.

Sir H. Courthope-Munroe.—" In accordance with the firm's instructions." Look at this extraordinary document. It is : " in accordance with the firm's instructions, but subject to the control of the Director of Development." Getting back to our dictionary, what does " control " mean—" restraint on the free will." Can one conceive a document like this?

Mr. Billimoria.—But that " control " does not mean that; that " control " means the administrative control, which is entirely different from the engineering control.

Sir H. Courthope-Munroe.—Let me try and answer that suggestion. I refer again to what Sir Frederick Hopkinson said, which was very apt—that there is no engineering in the actual work of the dredging. You have to buy the dredger, as he aptly pointed out, and that is all. We do not want a gentleman from London with high qualifications to come out to work the dredger. There is no engineering in it. It must be common ground that that is detail. If so, the party to carry out that job is, on the very terms of the contract, the Resident Engineer, subject to the instructions of the firm. What instructions are you going to have in the work of the dredger, or in cleaning out the quarry, or in cutting stone? Is that a job for a gentleman of the eminence of Sir George Buchanan? Surely not. When you say " the firm's instructions," I am not quarrelling with your putting it to me " the firm's instructions are to be given and they are to be subject to the control of the Director," but " control " is restraint of free will. What has happened in a case of this kind? Instructions are sent out to do this, that and the other. The Resident Engineer, Lewis, is in no sense a servant or watch-dog, or representative of the principal Engineer. He is body and soul handed over to the Director. Suppose he says, " I have the control of you, and do not do it," what then?

Sir Frederick Hopkinson.—Does not that cause an explosion at once?

Sir H. Courthope-Munroe.—It ought to, I agree; but if people make these documents, what is the principal Engineer to do?

Sir Frederick Hopkinson.—Your profession made that document, not mine.

Mr. Billimoria.—Do not you think that the word " control " naturally implies administrative control, and not engineering control?

Sir H. Courthope-Munroe.—I am talking about administrative control.

Mr. Billimoria.—If there is administrative control, that does not debar the firm's instructions from being carried out. That may only mean not paying out so many pounds, shillings or pence with regard to a certain item. That is all the control that is meant there.

Sir H. Courthope-Munroe.—I want to try and meet the point if I can; but I am afraid I do not follow you. Here is this detailed work being made a ghastly mess of by reason of the conduct of these pepole who are in charge of it. They have to look after it. They are in charge of the details, and they are under the control of the Director. How, on the true construction of this clause, can you possibly say that the principal Engineer, who, mark you (and I again go back to this) starts off by being employed as the Engineer, not as the dredger-master, not as the quarry-worker, not as the clerk of the works, but as the Engineer——

Sir Frederick Hopkinson.—But the Engineer to control all the others you mention.

Sir H. Courthope-Munroe.—Having got your Engineer, your primary duty would be in ordinary practice to control : and whom would you control?—the very first man would be the Resident Engineer. But here you take away the watch-dog. You lock him up, and you refuse to give him an independent man, and you say : " I am going to have sole control." Then all this happens; and you turn round and say : " Now this is your job, you the principal Engineer." I want seriously to meet your point; and I hope I have done it.

Mr. Billimoria.—But you must read paragraph 1 " as he may consider necessary to ensure the complete and satisfactory supervision of the works." Those words " to ensure the complete and satisfactory supervision of the works," have a special bearing

on the subject. Then it says in paragraph 3 : " The Resident Engineer will carry out the details of the work in accordance with the firm's instructions."

Sir H. Courthope-Munroe.—Quite so. I am obliged to you. Looking at this paragraph, we are deaing with the substance, that paragraph is directed to what Sir George is to do when he is in India, and as to his remaining there. This fiasco of the dredging work was not going on just the few weeks that he was there inspecting and what not, but it has been going on for years. Look at what I referred to yesterday. You have 2¼ years with a man in charge of the work who apparently ought not to have been in charge of anything. It is his misfortune, may be, but there it is. This Clause does not touch that. It deals with the question that he is to remain in Bombay such period as he honestly thinks sufficient, and as the Government may properly require, for the purpose of ensuring the complete and satisfactory supervision of the works. But it is right beside the point we are now discussing. It has been said again and again, and I entirely agree with it—Sir Frederick has said it, and everybody has said it—that the crux of the Inquiry is the dredging. Whether or not it was proper dredging obviously is a matter on which most exhaustive questions were put to Sir George. But the working of the dredgers, upon this agreement, is a matter which can in no sense be laid at his door. You remember the letter I referred to yesterday. I again point out that he had no power to dismiss Lewis himself. He had no power to deal with him at all. All he could do was to do what he did do. He was a voice crying in the wilderness for 2¼ years. In the instrument you have got this word " control." No doubt that is why Sir Grimwood said it was a curious condition to construe. Here you put up a man to do this, who in the normal course of things would be the servant, the *alter ego* and the eyes of the Engineer, and you put him absolutely in control of the contractor, or the person who is in that position. What can you expect? Your short-circuit every check that you would normally have in an ordinary case. In the ordinary way a man cannot get his money except by it going through the Resident Engineer and the principal Engineer. You short-circuit that; you make the employer the contractor. You get these Comic Opera or fairy-tale sort of estimates that were going on. What could the unfortunate principal Engineer do? It has been said by Sir Frederick Hopkinson, and one as things go can understand it, being wise after the event : " Why did he not put his hat on and go? Why did he not make representations to the proper Authority? " That is all very well, and at this stage it my be a fair observation to make. But Sir George had undertaken to carry out these works. What right had he to break his contract and pack up and go? He would have rendered himself liable to an action, if he had done it; and he would have done the very thing which the people who were on the spot would have been very glad to see him do. If he had done that, what would they have said? They would have said : " Look at the muddle he has got into, and now he has bolted." They would have said that for a certainty. I do not say, in the events which have happened, that people might not make the suggestions made by Sir Frederick; but if he had done that, then it would have been an end of Sir George. They would have said : " Look at the ghastly muddle that he has made in the state of affairs, and he has packed up and gone."

Chairman.—I do not quite agree. Suppose he had gone to the Governor, having prepared most careful memoranda; the Governor was deeply concerned with the success of this matter.

Sir H. Courthope-Munroe.—I agree.

Chairman.—Sir Leslie Wilson was just as much concerned as Lord Lloyd, although Sir Leslie Wilson had no responsibility for the initiation of the scheme. But he has, and would have the deepest interest in it, as a thing for the advantage of Bombay.

Sir H. Courthope-Munroe.—Good.

Chairman.—Sir George would have received the most sympathetic hearing from either Lord Lloyd or Sir Leslie Wilson. The mere intimation that his position had become impossible would have resulted in Lord Lloyd or Sir Leslie Wilson calling everybody before him, and there would have been a complete sweep up of the people who would not do their duty. It would never have got to resignation on the part of Sir George Buchanan; but he could have said : " Well, if there is not a clean sweep, then I must go;" and he would have gone under conditions which would not have rendered him subject to any criticism at all.

Sir H. Courthope-Munroe.—As I say, I can quite understand at this stage one feeling that.

Chairman.—That is how it strikes me.

Sir H. Courthope-Munroe.—I only want to say to you that there is another side to it. It might well have been said, if he had done what I respectfully suggest was a counsel of perfection : " You are a man of sense; you have made an agreement. You have carried it out. What do you mean? There is all this muddle. Now you have bolted."

Chairman.—It would not have been done in that way. It would have been done in a much more formal manner.

Sir Frederick Hopkinson.—You have to remember in these things individuals do not matter at all, it is the work that matters—the end.

Sir H. Courthope-Munroe.—I agree. I am entirely with you there. The only thing I want to say, and say again, is that this Committee has, as I respectfully suggest, to consider the conduct of this scheme. That must mean the conduct of A, B, C, D or E. My only complaint, if I may venture to make it, is that all this amount of wrong-doing has been laid against the door of sundry people. Anything that is within Sir George's purview I make no complaint about his being attacked mercilessly; but I do object to his being attacked for a number of things for which he has no more responsibility than I have. That is my point and my only point.

Chairman.—I am not content with what has been said at present about Clause 3. and I would like to put it in my way.

Sir H. Courthope-Munroe.—If you would kindly do so, I should be indebted to you.

Chairman.—I will. The middle part of the clause is: "And will carry out the details of the works in accordance with the firm's instructions." That is the point I want to discuss. Supposing it had run like this: That the firm will prepare a carefully considered programme, exact in all necessary details, and will communicate that programme with its details to the Resident Engineer, who will carry out the detail of the work—does it mean more than that? The extreme view is that the firm are to prepare details; they are to communicate those to the Resident Engineer; they are to instruct him to get on with those details, and instruct him to do them. For example, a letter from Meik & Buchanan to Lewis saying between October and December 1,600 tons of concrete are to be built into the sea-wall is a detail. Lewis, according to this, has got to do that. But if you turn to the fourth line, it is "subject to the control of the Director of Development."

Sir H. Courthope-Munroe.—Yes.

Chairman.—The Director of Development might say: "The price of cement is going up very high. Instead of 1,600 tons being put into that, I think 900 will do."

Sir H. Courthope-Munroe.—That is it.

Chairman.—It becomes unworkable.

Sir H. Courthope-Munroe.—That is my difficulty.

Mr. Billimoria.—Has it really become unworkable? Are there any instances in which the Director of Development has interfered and turned down the instructions of the firm? The Committee would very much welcome that evidence..

Chairman.—There is no evidence of his having done that.

Sir Frederick Hopkinson.—There is only one instance.

Chairman.—I am speaking very carefully, according to the way Mr. Billimoria puts it. There is no instance of that. There is only one instance where in February, 1925, they began the sealing of the sea-wall.

Mr. Billimoria.—That is quite right.

Chairman.—There has been no instance of the Engineers having put forward any scheme, having suggested any details, and Sir Lawless Hepper having stepped in and negatived them.

Mr. Billimoria.—No.

Chairman.—There has been no evidence of that.

Sir H. Courthope-Munroe.—No; and I do not want to put my case too high.

Mr. Billimoria.—Even with regard to that one item, Sir George Buchanan subsequently gave his approval to the action of the Development Directorate with regard to the sealing of the sea-wall. So if you are laying emphasis on "subject to the control of the Director of Development," I do not see where it comes in.

Chairman.—The fact that the Director of Development did not intervene does not really matter, if he had the power to intervene. He was given that power.

Sir H. Courthope-Munroe.—May I just read again three lines of what Lord Lloyd said: "He was a watch-dog. It was his duty to see that the organisation was working efficiently and economically." You see that, and then you say that Sir George is the man who ought to have done that. That is what I am endeavouring to meet.

Mr. Billimoria.—That is where supervision comes in.

Sir H. Courthope-Munroe.—I take that language to mean it was his duty. It was the duty of the Director to see that the organisation was working efficiently and working economically. Now it is said: "We find in the agreement somewhere that that

duty was not as Lord Lloyd said it was, the duty of the Director, but it was the duty of Sir George. What does he mean by not doing it?" Then I turn to the agreement and I say: "It does not say anything of the kind."

Mr. Billimoria.—Supposing there was inefficiency and want of economy on the part of the Director of Development, Sir George could come in with regard to supervision under the words "to ensure the complete and satisfactory supervision of the work."

Sir H. Courthope-Munroe.—I thought I had killed that. You are back on clause 1. That only deals with what he is to do the short time that he is in India; that does not control the whole of the agreement.

Sir Frederick Hopkinson.—But "supervision" surely means more than looking at a thing. It means satisfactory supervision.

Sir H. Courthope-Munroe.—I am not suggesting it does not.

Sir Frederick Hopkinson.—Supervision is seeing it is carried out economically and well.

Mr. Billimoria.—The words are still stronger in paragraph 1: "The firm agree to act as the Engineers of the Secretary of State in carrying out the said scheme and in the construction and execution of all works connected therewith."

Sir H. Courthope-Munroe.—Yes, as Engineers.

Mr. Billimoria.—As "the Engineers."

Sir H. Courthope-Munroe.—You have got the duty of the Engineers defined to be carried out as the general practical professional duty of Engineers within the four corners of this document. I do not want to escape from that for a moment; but what I say is: I did not undertake to act as quarry-master, and I did not undertake to work the dredgers.

Sir Frederick Hopkinson.—Yes, you did—you undertook to supervise it.

Sir H. Courthope-Munroe.—With great respect, that is a matter of opinion.

Sir Frederick Hopkinson.—You undertook to supervise it, did you not?

Sir H. Courthope-Munroe.—There again I say "supervise" is the word that is used in all these contracts; but it does not amount to superintending the details.

Sir Frederick Hopkinson.—It must have some practical meaning, must it not—something that is going to result in something?

Sir H. Courthope-Munroe.—As a man of business I am with you; but I am now speaking as a lawyer on this agreement.

Sir Frederick Hopkinson.—I thought they were both the same.

Sir H. Courthope-Munroe.—I cannot quarrel about that, but it is suggested that the effect of this agreement was to convert a person of Sir George's eminence in the engineering world into a Clerk of the Works, and a hundred-and-one other things. He will be charged with neglecting the duty of the office boy if it is put as high as that. He may, if you please, be responsible for what he has done wrong and what he has contracted to do if anything is wrong; but do not elaborate against him a hundred-and-one charges in a capacity for which he has no responsibility whatever. That is my point.

Chairman.—Clause 3 is the only thing which troubles me very much. I understand the rest of the agreement—at least, I think I do—but I do not understand Clause 3. Supposing under Clause 3 Sir George Buchanan was able to say: "I nominated a resident engineer. I gave him instructions as regards the details," had he any greater responsibility than that? "I nominated the resident engineer and I gave him instructions as regards the way in which the details of the work should be carried out. If Mr. Lewis did not carry them out, I, Sir George Buchanan, am not in any way to blame for that."

Sir H. Courthope-Munroe.—That is the way I venture to put it.

Chairman.—If that is the explanation then my difficulty goes. Where is the responsibility for Lewis carrying out the details of the work as an agent for Sir George Buchanan?

Sir H. Courthope-Munroe.—In that connection I want to call attention to a remark which was made by you which struck me at the moment as very apposite. You said this after we had a long discussion: "I think the real position was that Sir Lawless Hepper left it to Sir George Buchanan, and Sir George Buchanan left it to Sir Lawless Hepper, and therefore, relatively nothing was done." I think there you probably put your finger exactly on the spot; but what I want to say about that is this. If it was Sir Lawless Hepper's duty under the scheme, if you accept what Lord Lloyd has said, and you accept the reading of the agreement which I have put, there was nothing wrong legally or morally in Sir George Buchanan's leaving Sir Lawless Hepper, the watch-dog, to do his own work. That is my point. I think the Chairman

has put his finger exactly on the spot there, but no moral blame can be attached to me for leaving other people to do their own work.

Mr. Billimoria.—You do not accept the position that the resident engineer was the agent of Messrs. Meik and Buchanan in India?

Sir H. Courthope-Munroe.—That is the whole crux.

Mr. Billimoria.—Except in regard to the payment of his remuneration.

Sir H. Courthope-Munroe.—No.

Mr. Billimoria.—You say he was not the agent of the firm?

Sir H. Courthope-Munroe.—No; that is what I am hammering at for all I am worth. This contract was a departure from every other contract that I have come across, except where you have a Works Department, which ends in this sort of thing. In the ordinary contract which I put of an engineer in London, if you were to suggest in Westminster to a principal engineer that he would be responsible for the work of the resident engineer without any condition that the resident engineer was dismissable by him or controllable by him, but his reports were to go direct to someone else, a big engineer would not look at it. But when you are dealing with Governments you are in a different position, and you hope for the best. If Lord Lloyd had remained on things might have been different. That is the whole position. That brings us back at once to Clause 3, which is the root cause of the whole trouble, which takes the man who is naturally the watch-dog of the principal engineer, the man whom he relies on, his eyes, and, as I said a little time ago, his other self, and puts him absolutely in the pocket of the people concerned, the Development Directorate, and it short-circuits all control over money and all guarantee as to the value of the work. That is the difficulty. Then at the eleventh hour when this ghastly mess has arisen you turn round and say: "What about the principal engineer?" That is my trouble.

Chairman.—It is very difficult to say that Mr. Lewis was the agent of Sir George Buchanan when Sir George Buchanan could not dismiss him.

Sir H. Courthope-Munroe.—And it is in the evidence, or Sir George will tell you if it is not, that at one stage when he was writing and complaining, he asked to have a resident engineer of his own, and the Government would not have it and would not pay.

Chairman.—It broke down on the question of money.

Sir H. Courthope-Munroe.—That is it.

Chairman.—I do not think there is any harm in my saying my view at the present moment is that if Sir George were being challenged on Clause 3 it would be sufficient for him to say: "I nominated a resident engineer. I gave instructions to him as to the detailed method in which the works should be carried out. That was all I had to do except for my duty of supervision. As regards that work I had no further or other responsibility towards the resident engineer."

Sir H. Courthope-Munroe.—That is all I am anxious to call attention to.

Mr. Billimoria.—That cannot be the position. Supposing I employ one of my clerks to carry out a certain job and I give him definite instructions to do it. If he fails or if he is negligent, who is responsible? Not the clerk, but I.

Sir H. Courthope-Munroe.—Because you can sack him. That is the answer.

Chairman.—He was your servant.

Sir H. Courthope-Munroe.—He was your servant. You pay him and you can sack him when you wish.

Chairman.—You pay him. He was under contract with you, and you had the power to come down and turn him away at once.

Mr. Billimoria.—Supposing I do not pay him, but my client undertakes to pay me for whatever assistant I employ in that firm to carry out the job under my instructions and under my supervision. If that clerk still fails I would be responsible and not the clerk.

Sir H. Courthope-Munroe.—Certainly. That is the ordinary case I am trying to put to you. In the ordinary case of a resident engineer in big practice, in nine cases out of ten he is paid direct by the building owner. In some cases it is added to the salary of the principal engineer and he pays it; but that is quite immaterial. The resident engineer is employed by and dismissable by the principal engineer. That is the case you put. That is the whole thing. The mere fact of whether the payment goes direct to him or by addition to the fee of the principal engineer is quite immaterial.

Sir Frederick Hopkinson.—Would that apply in the case of a Government Department where the head of the Department has no power to dismiss those under him, but he has to take responsibility for what they do?

Chairman.—Heads of Departments frequently find themselves in a difficult position.

Sir H. Courthope-Munroe.—That is a departmental matter that I cannot discuss. If it works out as you suggest that may create an injustice; but I am only concerned with the gentleman on the other side of the hedge.

Sir M. Visvesvaraya.—This is the work of two parties. One was the Development Director and the other was the engineer. It was expected they would work in unison. If the engineer, having been in that position, thought he was not free to fulfil the terms of the contract, he should have made his position clear at every stage instead of allowing matters to drift.

Sir H. Courthope-Munroe.—That is the difficulty. The man who was in control was Lewis. If Lewis, as in the ordinary case, had been the servant of the principal engineer he could have dismissed him, and the whole responsibility would very properly have been laid at the door of Sir George. In fact, it would never have arisen because 2½ years ago the man would have been sacked. That is the answer to it. There it is. It is one of those things that happen when once you get this sort of Department. My memory goes back a long time, some 45 years, and I have a sort of recollection that 30 years ago there was something very similar in London. The chain was broken and you got this direct connection between the building owner and the contractor, and money simply ran to waste.

Mr. Billimoria.—With reference to the point you have raised, might I draw your attention to the letter dated the 22nd June, 1921, at page 13 of the book of correspondence? It is a letter written by Sir George Buchanan to Mr. Lewis: " I pointed out that our responsibility did not cease then as we were not only the engineers for the machinery, but for the execution of the entire work ". Does not that state that Mr. Lewis was under Sir George Buchanan's control absolutely, and that Sir George Buchanan himself admitted responsibility in regard to the execution of the work?

Sir H. Courthope-Munroe.—Are you asking me that as a lawyer, or as a man in the street?

Mr. Billimoria.—So far as these documents go.

Sir H. Courthope-Munroe.—The inquiry has now reached a stage when one has got to look at what were the obligations and duties of Sir George, and what were the duties and obligations of certain other parties. Doubtless throughout the correspondence you can find such expressions and statements. Sir M. Visvesvaraya pointed out that the Government did not accept the view which is put forward there. I agree that for what it is worth, there it is; but ultimately, when you come back to consider the very grave questions you have to deal with you must get back to the actual document and the actual agreement. I agree that on reading that you may say: " Here is a man hanging himself ".

Sir Frederick Hopkinson.—You must admit the circumstances that we are considering now are different from those where you are bringing an action for damages, are they not?

Sir H. Courthope-Munroe.—Yes; very difficult. It is entirely different. We are not on that at all. Mr. Billimoria is fully justified in puting that to me. There is the letter. But one knows that in the course of business correspondence a man very often inflates himself and calls himself this, that, and the other, as to which when you come to deal with it you find he is not anything of the kind.

Mr. Billimoria.—I think I could point out several other letters.

Sir H. Courthope-Munroe.—No doubt you and I could point out some.

Chairman.—I do not think there is any other letter which says in such plain terms: " Responsible for the examination of the work ". They have said " We are engineers responsible for the scheme ".

Sir M. Visvesvaraya.—And the execution.

Chairman.—Then let me have that because I have not got it, and I should like to have it.

Sir H. Courthope-Munroe.—That really is only paraphrasing this other one that we have been on: " Execution of the works but answerable " what as—as the engineers?

Mr. Billimoria.—There are several letters. There is one at page 55: " We are appointed the engineers in carrying out the scheme, and all the construction and execution of all the works connected therewith until their final completion ". That is a letter written by Messrs. Meik and Buchanan dated the 3rd June, 1922, to the chief engineer.

Sir M. Visvesvaraya.—On the 22nd July they say: " We are the actual responsible engineers ".

Chairman.—I remember that phrase.

Mr. Billimoria.—It is at page 55 : " In the execution of the works." Then on page 54 come the words: " We are the engineers responsible to the Government of Bombay and the Secretary of State." There are several letters like that, if you wish to refer to them.

Sir H. Courthope-Munroe.—A possible explanation occurs to me, that this exaggeration of the position may have been attempted by Sir George with a view of trying to get a control that he had not got. Still, as I say, this is a little off the line of argument. The question is this. You have to consider what is the true position. The true position, in fact, is the true position in law.

Chairman.—You had better explain a principle that you and I are very familiar with, which is this : When a document comes before the Court for construction it does not really matter what the parties have said. Suppose in a letter a man has written with regard to a certain document that it puts such-and-such an obligation on him, when the matter somes before a court of law for the construction of that document, you have to look at the document and see what obligations arise from the document, and not take the expression of opinion of the people who are concerned. A man may make most disadvantageous statements in a letter about the document, but the Court may say : " Oh, no, that was not the meaning of it all." The extent of the obligation must be gathered from the document itself, not from what the parties thought that it meant.

Sir H. Courthope-Munroe.—Quite so. I hesitated to address you on that because one knows that you know that better than I do. But, bearing in mind that there are other members of the Committee who are not lawyers, obviously that is so. You have to have regard to the document, construing it from the actual words used.

Sir Frederick Hopkinson.—And what is the obvious intention of it, and what is the obvious meaning of the two parties, so far as we can arrive at it.

Sir H. Courthope-Munroe.—Yes; but may I add that the meaning is to be gathered within the four corners of the document, not what you and I as men of the world may say that the parties meant? That is the trouble.

Mr. Billimoria.—I quite agree with the Chairman, but may I point out that before the document takes birth, if there are any conversations or interviews on which this document has been based, that is to be treated as the foundation to imply the meaning of several Clauses in the document?

Sir H. Courthope-Munroe.—No. For the purposes of this enquiry I am prepared to go with you, but as a matter of law I venture to say that that is not material.

Mr. Billimoria.—That is often said in a court of law.

Sir H. Courthope-Munroe.—If you were in a court of law on a question of damages, and you were proving the matter before the court of law, it would be simply this document and nothing else. You would not be allowed to look at what somebody said before the document. You could not go into that at all.

Sir Frederick Hopkinson.—That is why I said this enquiry is different from a case of bringing an action for damages.

Sir H. Courthope-Munroe.—It is; but the strong point I want to make is this : If you examine all the earlier history, if you examine the scheme, if you read what Lord Lloyd said was intended, if you follow what the agreement actually did, it all works in the same way. It was intended not, of course, to produce these results, but it was intended that the control and direction of the work, the smooth running and efficient working of it should be with Sir Lawless Hepper. It has been disastrous. You will hear from Sir George now if he were called upon to say which it should be, contract or Government work, he would plump for contractor's work straight away. In fact, he said so. But the intention of everybody at the start was to put the designing of the work with Messrs. Meik & Buchanan, and the carrying out of the work with the chief engineer. The director was responsible for the smooth and economical working, and also for obtaining the plant, subject to specification. That was all intended, and the agreement does it. In the events which have happened in India, apparently, when this disastrous state of things came about a scapegoat was wanted.

Mr. Billimoria.—The agreement goes further than that, because the agreement says : " shall at all times assist and advise the Government of Bombay."

Sir H. Courthope-Munroe.—That is what he was to do : to assist and advise and supervise. But the gravamen of the charges against him, in point of fact, is that he did not superintend all these details, which was somebody else's job.

Chairman.—I am not at all sure that that was any part of his duty.

Sir H. Courthope-Munroe.—That is my trouble.

Chairman.—That is the actual execution of the work in Bombay. It was his duty to advise on, and supervise, these works, but I am not at all sure how far that goes.

Sir H. Courthope-Munroe.—I do not quarrel with any of the questions put to, or the attacks made upon, Sir George Buchanan with reference to his design or his estimates, or those sort of things, but with regard to all this odd work such as the Kandivli Quarry, the dredger, the making of these cross-bunds, all the local work and all this mass of detail in regard to which the greater part of the trouble has arisen, I do say it is altogether wrong to lay it at Sir George's door. That is what I want to emphasise in connection with the agreement. I do not think there is very much more I need say in connection with the agreement.

Chairman.—No, I think that practically exhausts the agreement.

Sir H. Courthope-Munroe.—Paragraph 4 only deals with the question of the payment, which is not in dispute.

Chairman.—My difficulty is this: I cannot understand how any man would have accepted responsibility for the execution of works unless that man was going to be on the spot the whole of the time, or unless he had somebody there in whom he had the most implicit confidence. It seems to me heading for disaster otherwise.

Sir H. Courthope-Munroe.—I am not prepared to answer that. All I can say is that Sir George was acting in this case under the aegis of Lord Lloyd, and he did not realise that Lord Lloyd's day would come to an end sometime.

Sir M. Visvesvaraya.—Two or three people were jointly concerned. It was the team-work which failed. And all this disaster has resulted from that. It was the business of every member of the team to insist that he was given his share of the work according to the terms of his contract. Did your client insist on that?

Sir H. Courthope-Munroe.—I am sorry, but I do not quite follow.

Sir M. Visvesvaraya.—According to the terms of the contract there were certain duties binding on your client, and he ought to have made sure that he had the necessary opportunities at every stage of the scheme for the performance of those duties. If he was missed out at any time he ought to have insisted on his opportunities being restored to him. What has happened seems to be this: An estimate was prepared. It was found under the mark. Then a revised estimate was prepared. The Government ignored him and prepared a separate estimate themselves. Detailed plans and estimates for the complete scheme were not prepared by your client. With regard to the dredger, the specifications were apparently unsatisfactory and faulty. Then when the dredger was built according to the specification and brought on the scene, it failed to give the promised output. When all this happened the local chief engineer eventually took over some of your client's duties, and his word prevailed over that of your client. That seems to be what has happened, and the responsibility must be on your client in not securing opportunities to fulfil the terms of his contract. I only put this view before you. What have you to say to it?

Sir H. Courthope-Munroe.—I cannot accept that. I think the utmost which could be put against my client is what the Chairman has just said. It is a wonder that a gentleman of his position put his hand to the document. I think that is a perfectly fair observation, but I cannot agree that there was any sort of responsibility upon Sir George. He was writing innumerable letters one after the other—to go back to Lewis.

Sir M. Visvesvaraya.—There have been innumerable letters, but we have not got one comprehensive memorandum which was put forward as a convincing argument that things were going wrong and that matters should be handled differently. If such a memorandum had been given to the Bombay Government, they would certainly have acted on it.

Sir H. Courthope-Munroe.—But can you, in fairness, extract that from the documents? Assume an extreme case. Assume you were satisfied for the moment that my client had done everything he had contracted to do within the four corners of this document. Could you then blame him because he had not done something outside the document?

Sir M. Visvesvaraya.—Many things have not been done within the terms of the document because he did not assert himself.

Sir H. Courthope-Munroe.—What is it which he bound himself to do under this contract that he has not done?

Sir M. Visvesvaraya.—For instance, detailed plans and specifications. Do you know, Sir Harry, that the sanctioned estimate which has been in operation since 1922, was not prepared by your client? Why is that?

Sir H. Courthope-Munroe.—I do not follow. If it is said that he ought to have prepared certain plans and that he has not done so, very well, then I should like to put

that to Sir George at once. I agree that if that is so, obviously it requires answering, but I say that he has done everything he contracted to do.

Sir M. Visvesvaraya.—There is one more question I want to put to you. The Government with whom you were under contract to carry out and help in this work——

Sir H. Courthope-Munroe.—Do not use the phrase " Carry out " ; I object to that.

Sir Visvesvaraya.—To carry out in association with the Government. It is team work. Many big works have to be carried out by several heads co-operating. That co-operation should have existed but did not exist here. The reason seems to be that in some cases the work done was not satisfactory and was not in sufficient detail for the people to follow, consequently they ignored the instructions and carried on in their own way.

Sir H. Courthope-Munroe.—I am not out to defend in any sense the want of co-operation. It is obvious that in a work of this kind only one result can happen if you do not have co-operation.

Sir M. Visvesvaraya.—If your client had prepared a complete memorandum of the situation at any stage and had offered it to Government, Government would have stopped the interference you complain of.

Sir H. Courthope-Munroe.—I am not prepared to controvert that. All I say on it, with very great respect to the Committee, is that it is rather a counsel of perfection. Can you call to mind any case where any one person has gone direct to Government and attacked a Government department and asked for their abolition?

Sir M. Visvesvaraya.—Many people have done that—Contractors usually do.

Sir H. Courthope-Munroe.—It is a big responsibility to suggest to a London engineer that because he is dissatisfied he has to invite a Government to wipe out an entire Government department. The result would have been that he would have been dead and buried by now.

Sir M. Visvesvaraya.—Under this contract the Department is one party and you, the engineers, are the other party. You have to work in unison. If you say " The other man prevented me from doing it; I have no authority; I cannot do anything," that will be an excuse, not a reason. You should go to the principal and say " This man is preventing me from carrying out my share of the work." If a convincing argument had been put forward in a memorandum, Government would have taken it up. What have you to say to that?

Chairman.—We are getting a little beyond the construction of the agreement now. We are getting in to the merits, and we had better not express opinions about them. Anyhow, that is how the thing stands. You have told us about this agreement. I think you misunderstood something I said if you thought that I said that I could not understand why Sir George Buchanan put his hand to this agreement. I did not say that. What I said was that I could not understand any man agreeing to be put into such a position that he would be responsible for the execution of the works—which is a very different thing.

Sir H. Courthope-Munroe.—I did not wish to put it too high, and I entirely agree with your view.

Chairman.—Suppose he is in England in May, and in May there is a complete breakdown of the Kandivli Quarry owing, if you like, to gross misbehaviour on the part of three or four people up there. Is he to be responsible for that? If when he said that he was appointed engineers in carrying out the scheme and in the construction and execution of all works connected therewith he meant he was taking the responsibility for the due execution of all works, I cannot understand his accepting that position. If he meant that as engineers he was responsible in all matters relating to the execution of the works, then I understand it.

Sir H. Courthope-Munroe.—I agree, Sir, but one cannot attempt to construe this agreement by reference to loose expressions in correspondence.

Sir Frederick Hopkinson.—Are we to draw any conclusion of any kind as regards to relations between the amount paid for the work done under this contract as to whether it could be held to cover bare supervision, or supervision and control. The amount paid is 2 per cent. on 700 lakhs, which is £105,000.

Sir H. Courthope-Munroe.—I am not going to discuss the question of quantum. That is a matter of the contract.

Chairman.—What Sir Frederick has in his mind is this—that an engineer employed to get out plans in a very big thing like 367 lakhs might be content with half per cent. or 1 per cent., but that if you are going to increase his responsibilities by putting on him duties that are wider than those ordinarily performed by engineers, you have got to increase his remuneration. I think Sir Frederick would like your view, or the opinion of Sir George Buchanan, whether the bargain to give him 2 per cent. on the 367 lakhs

did not imply that he had more duties to perform than would fall to the lot of the ordinary engineer.

Sir Frederick Hopkinson.—Under the narrow meaning of the word " supervision."

Sir H. Courthope-Munroe.—When I come to deal with the evidence I will put that, but as a lawyer I should say you cannot incorporate that into this agreement in any sense of the word. You would want a lot of expert evidence. Some people might say 2 per cent. was quite inadequate and that it ought to be 5 per cent. Look at the enquiry you would embark upon if you were going to construe this agreement by reference to the money mentioned in it.

Sir Frederick Hopkinson.—Happily I am not a lawyer.

Sir H. Courthope-Munroe.—You have the advantage of being an eminent contractor.

Chairman.—Does that conclude your argument on this point?

Sir H. Courthope-Munroe.—I am reminded by my friend of one other point which I wanted to make. In dealing with the agreement, I referred to what I called the modification of the agreement which is contained in a letter with an annexe to it of the 30th January, 1923. I said not quite accurately that I had exhausted the effect of that agreement by the insertion of those few words in paragraph 1A; but there is a point to which I want to draw your attention which is contained in paragraph C, the last paragraph of that modification, and it runs in this way: " The obligation which clause 1A of the agreement lays on the engineers to carry out certain work in London may, with a view to securing a workable arrangement, be held to be confined to the permanent works only of the reclamation, including the storm-water drains referred to in B." Now this is what I want to draw your attention to: " and in order to insure better co-ordination, all correspondence between the engineers and the Chief Engineer Reclamation Branch should in future be addressed through the Director of Development, a copy of each document being forwarded at the same time for record in the Director's Office." If anything was wanting to stamp the position that the resident engineer was, in no possible sense of the word, the servant of Sir George Buchanan, it is that. We are not even allowed to address him direct. We have got to address him through the Government Department and on one occasion when we did, after that, address him direct, we were hauled over the coals for doing so.

Mr. Billimoria.—Is not that a matter of convenience, or a matter of record, for the Government?

Sir H. Courthope-Munroe.—I am not complaining a bit about the Government action in doing it. That is entirely a matter for Government, but what I do say is that this emphasises beyond all question the position which I take up—that the effect of this document is entirely to remove the resident engineer from being in any sense of the word our servant or under our control. It is suggested that I should read the question to which this is an answer. The words of paragraph C on the preceding page are " and as to the relationship between Messrs. Meik and Buchanan on the one side and the Government and the Chief Engineer Reclamation Branch on the other." It was in answer to this question as to the relationship between the parties that at this stage in 1923 it was definitely stated that he was the servant of the Director of Development, and this provides that you shall not even write direct to him.

Mr. Billimoria.—That only meant that the Director of Development was a Post Office as between Sir George Buchanan and the resident engineer.

Sir H. Courthope-Munroe.—May I go back to the question you put to me about your clerk just now. He would not go through the operation of the Post Office. If he disobeyed your orders and got you into trouble you would get at him direct.

Sir Frederick Hopkinson.—It is a very common thing in Government works to have this Post Office system.

Sir H. Courthope-Munroe.—I do say that these two paragraphs emphasise the position which I say is the true construction of the agreement. I do not think, Sir, that I can usefully add anything to what I have said.

Chairman.—With regard to Monday, Monday is the last day on which we can have this room. You must get through then. You can get through most easily.

Sir H. Courthope-Munroe.—I think I may say I will do it.

Chairman.—I think we must do it.

Sir H. Courthope-Munroe.—I would only ask you to bear in mind that this is the 56th day, and that there were a large number of witnesses called in India, and some in London, and it is in consequence of the various things which were said in India that you have been good enough to allow me to intervene and deal with that evidence. You may take it from me that I shall be as brief as I possibly can.

Chairman.—I think you can manage it well within the compass of the day.

(*Adjourned to Monday, 15th November, at 11 a.m.*)

The Committee Assembled at 11 a.m. on the 15th November, 1926, all the Members being present.

Sir George Buchanan, recalled and further examined.

Sir H. Courthope-Munroe.—I think, Sir, I had better go straight to the Bombay evidence, and get through it as quickly as I can. You have made some extracts, Sir George, from the Bombay evidence, have you not?

A.—Yes, I have.

Q.—Just take the document in your hand, because it will conduce to my dealing with it fairly briefly. If I attempted to tackle the actual shorthand notes we should be here for another week. I will just go through the various points which you have extracted from the Bombay evidence, and in reference to which I think you desire to make comments and, in many cases, denials?

A.—Yes.

Q.—Is there anything in the first half-dozen pages with which you want specially to deal? Do not touch on anything we have discussed, because it is no good going over old ground again.

A.—No.

Q.—The evidence you are now dealing with is that of Captain Headlam. He is the first witness?

A.—Yes.

Q.—I see that the second witness is Sir Lawless Hepper. He is the important witness whose evidence you want to deal with in some detail. Is there anything you wish to mention until you come to page 7? Page 7 deals with the escape of material through the rubble wall.

A.—I should like to deny the allegation of Sir Lawless Hepper that I was of opinion that the scheme would prove to be a great financial success.

Q.—I was going to deal with that a little later on. I have that in mind, and I will mark it so as not to deal with it twice. On the following page there is a reference to the working of the dredger, but the Committee know all about that, and what your contention is. That brings us to page 7.

A.—I think we can pass page 7. All that has been dealt with.

Chairman.—Surely, Sir Harry, Sir George Buchanan has modelled his statement on the previous evidence which was sent to him from Bombay and received in England? You are surely not going over it page by page?

Sir H. Courthope-Munroe.—No. I particularly want to avoid doing anything like that, because obviously that would be a waste of time; but where witnesses have made statements which are in conflict with what Sir George says happened, or where they have said that Sir George has done certain things and said certain things which he says he did not do or say, I want to give him the opportunity of dealing with them.

Witness.—I think we can go on to page 14.

Sir H. Courthope-Munroe.—I think first of all you want to refer to some matters on page 11?

A.—Yes, I do.

Q.—Some questions were put by Sir Frederick Hopkinson to Sir Lawless Hepper. I see that Sir Frederick puts this question: "Therefore you are entirely responsible for the scheme as Director?" The answer given by Sir Lawless Hepper is: "I am not in any way responsible for the technical details of the scheme." Then Sir Frederick Hopkinson says: "For the design or the carrying out."—(A.) "No, I am not responsible." You wish to emphasise what I said on Saturday, and refer to the scheme itself?

A.—Yes.

Q.—Then it is said, "Who is?" and the answer is: "Sir George was." You deny that, for the reasons which I put in some detail on Saturday?

A.—Yes.

Q.—Then Sir Frederick asks: "Who is since he left?" He says that nothing has been said about that. "Do you mean there is no one in sole charge of the whole scheme?" Sir Frederick says: "I thought, as Director, you would have been responsible from the beginning." That, according to your view, is the true way of looking at it?

A.—He was responsible for carrying out the work.

Q.—Passing rapidly down that page, I see that Sir Frederick again comes forward and says: "Surely, as Director, you are responsible?" Then the answer is: "I have

always assumed that for the technical details Messrs. Meik & Buchanan have been responsible as engineers." I observe that that is the second time he has ridden off on the word " technical." A little lower down Sir Frederick Hopkinson puts it to him ; " They are purely the engineers? You have the sole responsibility. They act under your instructions," and then, for the third time he says: " No, not in technical matters. I have never considered I am competent to give them instructions in technical matters." Then Sir Fredericks says: " They sent their reports to you." That you did?

A.—Yes.

Q.—And then he says " Yes, every time Sir George Buchanan came out he made reports to the Government.—(A.) To you, or to the Government. It was all addressed to you." In answer to a question by Sir M. Visvesvaraya, Sir Lawless Hepper says: " Yes, I think it is addressed to me, but I have never assumed that I was in the position to dictate to them in any way as regards engineering technicalities." There we are, off for the fourth time on the word " technicality." Are you able to gather exactly what he means by that?

A.—I have nothing much to add to what you said on Saturday. He and his Chief Engineer were responsible for the technicalities in connection with the carrying out of the work.

Q.—But, as we have heard in this case, not once, but a dozen times, the major part of this affair which has caused the loss is the dredging, and Sir Frederick Hopkinson, as I pointed out on Saturday, made this very clear at page 59 of the meeting of the 3rd November, where he said: " But circumstances are not quite the same in that case and in Bombay. Take the dredging, for instance, which is the major part of the scheme in Bombay. There is no designing there, having once bought your dredger.—(A.) The actual designing required for the Back Bay work is very small.—(Q.) Is there any in the dredging work in Bombay.—(A.) No actual designing." Then there is a very pertinent question put by Sir Frederick: " Is there any engineering in it beyond buying the dredger—there are no plans to make.—(A.) There are no plans to make.—(Q.) There is nothing to supervise. All you have to do is to get your output?—(A.) All you have to do is to get your output.—(Q.) There is no engineering about it at all.—(A.) It is in the wall that there is engineering." If, as we have been told, that the major part of the affair which has caused the loss is the bad management and working of the dredger with regard to this point which Sir Lawless Hepper is making on four different occasions about not being answerable for technicalities, would this ordinary work of cleaning out the mud in this place be regarded as an engineering technicality, or not engineering at all, in your view?

A.—It all comes under the head——

Sir H. Courthope-Munroe.—Can you conceive anything which is less of an engineering technicality?

Chairman.—You would put it on the same ground as the Khandivli quarry, would you not? Is there any substantial difference between the excavation at Khandivli quarry and the excavating of the mud in the harbour?

A.—No, I should say they could be put on the same lines.

Sir H. Courthope-Munroe.—It is a little difficult to trace from this evidence what Sir Lawless Hepper did regard as his work. He kept on saying that the engineering technicalities were nothing to do with him. Could this main thing—the dredging—be in any case deemed to be an engineering technicality?

A.—He was responsible for all the administrative work in connection with the dredgers—putting them on double time, the paying of bonuses, and generally seeing that everything was done by proper team work.

Q.—Let me go to one other matter of some little importance. I will turn to page 14 of your extracts. This question was put to you by Sir Frederick Hopkinson, "Did you in fact get tenders for building the wall? " You say, " Tenders were called for for the first 8,000 feet from Colaba.—(Q.) On what date.—(A.) It was, I think, December 1920, or January 1921, very soon after the work started.—(Q.) Sir George Buchanan says on 7th February he was not in favour of accepting any tender." I think you dealt with that on page 92 of your statement.?

Chairman.—Yes, we have all that in the statement. Is there any new fact, Sir George, which you want to add now which is not in your statement, because we know your statement?

A.—No ; there is no new fact which is not in my statement.

Sir H. Courthope-Munroe.—You were in favour, at the start, of the matter being put out for contract?

Chairman.—He said definitely that he strongly wished Colonel Grisewood to have the contract ; that Lord Lloyd wanted him to have the contract, and that if the contract

had been given out to Colonel Grisewood, the work would have been begun in October, 1920. We know all that.

Witness.—Excuse me, Mr. Chairman, but Colonel Grisewood's tender was in October, 1920. This Colaba contract was another matter altogether.

Chairman.—A later one.

Sir H. Courthope-Munroe.—What I was coming to was this. Sir Frederick Hopkinson put this question to you about these tenders: " It is a fact, is it not, as appears from your evidence on page 92, that the tenders were received from Messrs. Pauling & Co., Messrs. Pearson & Co., and the Indian Construction Company "—that is Colonel Grisewood's firm to whom the Chairman has referred?

A.—Yes.

Q.—What I want to ask you on this point is this. It was put by Sir Frederick to Sir Lawless Hepper. He says this: " Actual tenders were asked for in 1920. I cannot give you the exact date. I believe tenders were sent in. I think there were about six tenders." Then he says, " And declined by Sir George Buchanan on February 7th," and Sir Lawless Hepper answers, I fancy somewhat ingenuously, " Yes." I think in that connection you wish to refer, do you not, to a note which you have found in your diary?

A.—Yes, I am producing that.

Q.—What happened was this, was it not? When these tenders were sent in you, Sir Lawless Hepper the Director of Development, and the Resident Engineer, Mr. Lewis, all met and discussed this matter?

A.—We did.

Q.—And then, having come to a decision, or, rather, having thought the matter over, you met again and had another consideration, and it was at that second meeting that the whole three of you came to the conclusion that, in the best interests of the work and of economy, it should not be done by contract?

A.—Yes.

Q.—Is it wholly misleading to suggest here that you, having got these contracts, of your own turned them down?

A.—It is wholly misleading. The extract from my diary says, " 8th February, 1921. Meeting with Hepper at 11 a.m. to discuss the tenders for Colaba contract. Lewis present, and all agreed it should be departmental."

Chairman.—You have already told us that.

Sir H. Courthope-Munroe.—I am sorry. It is not as I read it, and it is on the notes of the Bombay evidence.

Chairman.—Sir George Buchanan, since he came into this room, has referred to that in most definite terms. I knew that.

Sir H. Courthope-Munroe.—I did not appreciate it. It seemed to me that it stood that Sir George had done that.

Chairman.—No. He has already told us about it.

Sir H. Courthope-Munroe.—If that is so I will pass from it at once. While we are on this, let me clear up one other matter in connection with the tenders, and that is the tender for the dredger. I will take it quite shortly. Can there be any two opinions, Sir George, that Messrs. Simons, as dredger builders, are an eminent firm?

A.—No.

Q.—They are a well-known firm?

A.—They are a well-known firm.

Q.—You invited tenders, I think, and you got them from, how many people?

A.—The actual comparison which Mr. Meik prepared was that between Simons and Lobnitz.

Q.—Were they the only two it went out to?

A.—No, it went out to Fleming and Ferguson and Ferguson Brothers.

Q.—Tenders were asked for from Simons, Lobnitz, and who else?

A.—Fleming, and Ferguson and Ferguson Brothers—four firms.

Q.—On Friday I think it was Sir Frederick put to you a great many questions dealing with the tender made by Messrs. Lobnitz?

A.—Yes.

Q.—As far as I gather there were no questions put to you by him in connection with tenders of any of the other firms?

A.—Yes, there were. He asked why Fleming and Ferguson had not received full particulars.

Chairman.—Fleming and Ferguson asked for five rather simple answers to simple questions. For some reason which is not very apparent, Mr. C. S. Meik said he would have to send a letter to India. I can give you the document.

Sir H. Courthope-Munroe.—One can quite understand Sir Frederick's preference for the eminent firm of Lobnitz. In most of Pearsons' contracts, if there is any dredging work to be done, Lobnitz do it. Will you just tell the Committee why it was that you, in your honest judgment, gave preference to Messrs. Simons? What were the figures?

A.—Mr Meik took in the tenders and the result of his comparison showed that Lobnitz's tender was £840,000 and Simon's tender was £496,650, including the 10 per cent. for the extension of time.

Q.—Let me see if I have got it right. £496,650 as against £840,000?

A.—Yes.

Chairman.—And two dredgers as against one?

A.—Yes. I say that on the facts before him at that time we were surely justified in considering Simon's tender the most satisfactory? I am putting it on the facts before us at that time. Supposing we had recommended the very much higher price of Lobnitz, unless there were overwhelming reasons, which we do not admit there were at that time, what would have been said?

Sir H. Courthorpe-Munroe.—There is something like 75 per cent. difference between the tenders.

Sir Frederick Hopkinson.—Surely you have your figures wrong.

Chairman.—We have the whole documents. As it has been presented to us it conveys a wholly inaccurate impression. The figures are not right even.

Sir H. Courthope-Munroe.—Can you answer that question at once, Sir George?

A.—No, I cannot.

Q.—I am asking you to give the particular reasons which led you to prefer the tender to Messrs. Simons to the tender of Lobnitz?

A.—That is the reason I give—that according to the figures prepared by Mr. Meik, whom we cannot re-call, Lobnitz's tender was £840,000 and Simons' tender was £496,000.

Sir H. Courthope-Munroe.—No doubt you will be asked by Sir Frederick Hopkinson——

Chairman.—Let me help you, Sir Harry. The fact was that Sir George Buchanan was in India at the time. These three firms were asked to tender. One said, " I have no small berth vacant " and he dropped out. Fleming and Ferguson asked five questions which were probably not difficult to answer, but Mr. Meik did not answer them, and he said he would send the letter to India to Sir George Buchanan. Sending the letter to India was not of great help because the matter was urgent. However, that is how Fleming and Ferguson dropped out. Lobnitz were left. Lobnitz send on 22nd January a very full, long tender, and, as Sir Frederick Hopkinson worked it out, he showed you that on the price per ton Lobnitz' was a better one than Simons'.

Sir Frederick Hopkinson.—Horse power.

Chairman.—He also pointed out that there was double stage pump and 14,000 feet of pipe line.

Sir Frederick Hopkinson.—19,000 feet of pipe line.

Chairman.—The letter of Meik and Buchanan asked for 14,000 feet. Apparently Lobnitz specified for 19,000. None of those facts were ever conveyed to Sir George Buchanan. All the information he got was a very short concise telegram from Mr. Meik not giving particulars which would have enabled him to form a sound judgment. It is not his fault, but that is the fact. Nothing can get over those facts.

Sir H. Courthope-Munroe.—I am much obliged to you. (*To the Witness*): Could you at this juncture put before the Committee, if they have not got it, the actual letter that started the ball between you and Simons. It is the 25th July?

A.—They have got it.

Sir H. Courthope-Munroe.—You wrote that letter, and then in answer to that they sent you a tender?

Chairman.—Let us get it right. Letter of 25th July. A day or two prevous to that, an interview with Mr. McMurray. Letter 25th; visit to Renfrew, August 29th; letter September 12th. Those are the material dates.

Sir H. Courthope-Munroe.—With that letter I see you sent them a plan asking for the dredger plant required, which was to carry out the work on the plan. The Committee have got it and therefore I pass from it. Let us get on to the next matter. I see Sir Frederick Hopkinson asks questions of Sir Lawless Hepper again about the commencing of the wall from both ends, but you have dealt with that?

A.—Yes, that has been dealt with fully.

Q.—On page 19 I see that Sir Frederick Hopkinson is again trying to get light on the question of responsibility. He says to Sir Lawless Hepper, " What is the actual

chain of responsibility? When Sir George Buchanan was in charge he was supposed to be chief engineer directing all the operation?—(A.) Yes." You have dealt with that. It is on page 19 of your extracts, and it is in the examination of Sir Lawless Hepper. His answer is " Yes "—that you were in charge directing all the operations. You altogether deny that?

A.—I deny that absolutely.

Q.—It is quite inconsistent with the evidence given by Lord Lloyd, which the Committee had before them at a subsequent date. There is another matter which somewhat hurt your feelings. Sir Frederick Hopkinson, putting these questions to Sir Lawless Hepper, though possibly not with the view of the agreement which we now have before us, put this : " If you look at the agreement, it was definitely settled there. It was laid down that such works shall be commenced forthwith, and all such drawings, specifications, schedules and estimates, and any fresh or amended drawings, specifications, schedules of quantities and rates or estimates as may from time to time be required during the progress of the work shall be promptly prepared and forwarded to the Government of Bombay, and shall become the property of the Secretary of State." I am reading from page 20. So far as Sir Frederick read the document I make no complaint, but what I am venturing respectfully to complain of is his summing-up of the position, because he says there: " So it is all laid down definitely. Actually you were doing Buchanan's work out here." I think that is a thing you absolutely deny, Sir George?

A.—I absolutely deny it.

Chairman.—One moment. Was that with regard to storm water drains?

Sir H. Courthope-Munroe.—I think it was with reference to the general position.

Witness.—It was with reference to the general position.

Sir Frederick Hopkinson.—No.

Sir H. Courthope-Munroe.—If you say no I accept it, of course, but the general paragraph is read, and then Sir Frederick sums it up (it might be justified in one view of the agreement, but when you sit down and read the agreement I suggest it is quite a misapprehension) : " So it is all laid down definitely. Actually you "—that is, Sir Lawless Hepper—" were doing Buchanan's work out here?—(A.) Yes."

Sir Frederick Hopkinson.—The evidence given was that they were designing the storm water drains.

Chairman.—And, if you remember, on the 4th January, 1923, there was an interview with Sir Chimanlal Setalvad, and he commenced by saying : " Why have we got a staff of draughtsmen here. What does all this mean." That is how he commenced the interview.

Sir H. Courthope-Munroe.—You have had the advantage of seeing the witnesses at the earlier stages of the proceedings.

Chairman.—That is in Sir George Buchanan's statement. He sets out an interview of the 4th January, 1923, and he himself says that it commenced by Sir Chimanlal Setalvad saying : " Why have we got a staff of draughtsmen here? Is not that your work? " That resulted in the agreement, if you remember, by which it was arranged that as regards permanent works Sir George should design them.

Witness.—That was right, yes.

Sir H. Courthope-Munroe.—As long as it is understood that we repudiate altogether the suggestion that Sir Lawless Hepper ever did any work on behalf of Buchanan, it is all right. It is quite possible there might have been a mistake. It is a little difficult to find out exactly what Sir Lawless Hepper's work was.

Chairman.—I wish you would tell us.

Sir Frederick Hopkinson.—Is not that why I pressed it so hardly?

Sir H. Courthope-Munroe.—I am not complaining. I started by saying that one must remember in reading this book through, that it was a different agreement pronounced upon by the Chairman—Sir M. Visvesvaraya taking one view and you taking another view. No doubt your questions were put in support of your own view.

Sir Frederick Hopkinson.—My questions were put in order to find out the facts.

Chairman.—If you will tell us from the evidence what Sir Lawless Hepper professed to be doing, we shall be very grateful to you.

Sir H. Courthope-Munroe.—That is my puzzle.

Chairman.—I do not pretend to know at present.

Sir H. Courthope-Munroe.—That is my difficulty. Here was a gentleman whom Lord Lloyd said was to be a watch dog, and was in charge of everything to see the

smooth and efficient working of the scheme, and whenever he is cornered by Sir Frederick Hopkinson or by you or by any member of the Committee he says (as I have pointed out four times) that he is not responsible for technical details. The big thing, as far as I can see, was the dredging, and obviously there is nothing less technical than dredging. I cannot discover from this what his particular job was.

Sir Frederick Hopkinson.—You will probably agree that I really tried to find out the position.

Sir H. Courthope-Munroe.—You did, Sir.

Chairman.—We all did.

Sir H. Courthope-Munroe.—And your only success at this stage appears to have been that it seemed to emerge indirectly that he was doing his own work and Sir George's. That is all I want to point out. At the bottom of page 20, Sir George, there is one matter I want to mention in order to pass it. It is suggested that you took what Mr. Kidd had done blindly. I think you have gone into that?

A.—Certainly, I took his soundings.

Q.—Shall we pass on to page 22—management. There again Sir Frederick was trying to find out the chain of responsibility, and he puts some very pertinent questions here. He says, " Do you think that it had a management of that character?—(A.) I think it had the management it deserved. I do not know how far I am personally concerned in this." I should have thought pages 19 and 37 of the scheme would have been enough for that—what is stated there, apart from Lord Lloyd's evidence. Then he says, " I put you aside. Meik and Buchanan were doing the work." That is based on the other view of the agreement. Then Sir Frederick puts this very pertinent question: " Had they decided to do it departmentally, do not you think the proper procedure would have been to search the world and offer £20,000 or £30,000 a year to manage the thing? " He says he cannot imagine the Government doing that.

A.—Sir Lawless Hepper was undoubtedly the manager.

Q.—In dealing with the management he says: " I do not know how far I am personally concerned in this." He has obviously stripped the board entirely of anything that can be, by any stretch of the imagination, called " technical," and our difficulty is to find out what is left. Then on page 24 there is this question about the suggested antipathy between you and Mr. Lewis, but I will pass that by because we have dealt with it at some length. On page 25 there are some questions put to Sir Lawless Hepper about the laying out of the site as distinguished from filling in?

A.—I have already discussed that.

Q.—Then at page 28 the question is put by Sir M. Visvesvaraya about the pumping: " Of course, had Sir George Buchanan's ideas been satisfactory there would have been no other dredger required but the " Lloyd " and the " Colaba "? There is no provision in his scheme for pumping from Back Bay?—(A.) No, there was not." The pumping from Back Bay was initiated by Mr. Lewis, was it not?

A.—By Mr. Lewis, in conjunction with Sir Lawless Hepper.

Q.—It had nothing to do with you?

A.—Not the initiation, no.

Q.—Then I see that at the bottom of the same page questions are put by Sir Frederick Hopkinson to Sir Lawless Hepper about the staff. He says: " I am going to ask you a rather delicate question. Are all your staff connected with the dredging in a happy or in an unhappy state of mind "? He says: " I thiuk myself they are in a happy state of mind. I have heard nothing to the contrary." How does that fit in with your recollection when you were there?

A.—Certainly it is not in accordance with my recollection. I do not think I ever went to Bombay without receiving memorials from the crews of the dredgers making numbers of complaints. It was no business of mine to receive memorials, and I naturally handed them back to the superintendent of dredging for him to see the Director about it.

Q.—I think one of the witnesses pointed out that in one case the crew had to be got rid of and a fresh crew got?

A.—They were not happy, and when men are unhappy and there is no team work, naturally the work suffers.

Chairman.—Was it not your duty to advise the Bombay Government that that state of things was going on?

A.—I do not conceive that to be my duty. The Director was the manager.

Q.—But if you believed that there was such disaffection amongst the crew so that they were not really turning out their work, as the adviser of the Bombay Government, ought you not to have looked into the matter? You had to assist and advise and supervise. Those are the three words?

A.—But I had not to interview dredging individuals who had grievances.

Q.—No, but if you came to the conclusion that the work was suffering because there was discontent amongst the crews, ought not you to have taken it up with Sir Lawless Hepper?

A.—Well, I probably did discuss it with Sir Lawless Hepper. I certainly have not put anything in writing about it.

Q.—And further, if you got no satisfaction from Sir Lawless Hepper, ought you not to have gone up to the Governor or to Sir Cowasji Jehangir?

A.—There we are coming back to the old question.

Q.—I know, but you and I know how perfectly easy it would have been to have got an interview with Sir Leslie Wilson or Sir Cowasji Jehangir. You and I know how ready both of them would have been to have helped you in every passible way?

A.—I cannot subscribe to that view, Mr. Chairman. What happened, for instance, in connection with Mr. Lewis? What happened after I had spoken to the Governor of Bombay and written to the Governor of Bombay and spoken to the Honourable Member? What happened after all this correspondence. With all the papers before him, all the Honourable Member did was to say: "Well, Mr. Lewis must in future direct all his correspondence through the Director of Development."

Q.—Have you any letter which you sent to the Governor and to Sir Cowasji Jehangir?

A.—I can put in the correspondence.

Q.—The letter I want, if there is one, is a letter in which you spoke about the necessity of Mr. Lewis leaving. That is the matter you are referring to, is it not?

A.—That is the matter I am referring to.

Q.—If you have a letter of that kind will you let Mr. Ewbank have it, because we would like to see the terms of it?

A.—I will put in all the letters.

Sir H. Courthope-Munroe.—Do you want the letter to which I referred? There are four or five.

Chairman.—It seems to me we shall want them. I have made a note of one or two documents which we were promised.

Sir H. Courthope-Munroe.—I want you to have them. I referred to four or five. If those are the ones you want I will see that they are put in.

Witness.—Is the one you refer to the letter of the 3rd June, 1922? It is the one I refer to in my note, I think. After going at some length into the matter it finishes up by saying that there can be little doubt that Lewis's health has broken down seriously and "in the opinion of Mr. Meik and myself you would do well to have him examined at home by a Medical Board for an expression of opinion as to his fitness to continue hard work in the East."

Chairman.—Was that to the Governor?

A.—That was addressed to Sir Lawless Hepper. The letter to the Governor was put in.

Sir H. Courthope-Munroe.—Let us get it right. What is the date of that letter?

A.—3rd June, 1922.

Sir H. Courthope-Munroe.—I also read one of the 8th June. Have you got that, Sir?

Witness.—The letter to the Governor was on the 31st July, 1922.

Sir H. Courthope-Munroe.—I referred to that.

Secretary.—They have not reached me yet.

Witness.—I read it out.

Chairman.—Then it is on the shorthand notes?

A.—It should be.

Sir H. Courthope-Munroe.—If you have not got it you ought to have it. I seem to have a little bundle of correspondence here. I will hand them in. (To the witness) This is the letter of the 31st addressed by you to Sir George Lloyd?

A.—That is the one.

Q. What did you say in that letter?

A.—I read the letter out at a previous meeting of the Committee. It is to the effect that there seemed to be some misapprehension as to our position and that we were very much concerned about the absolute cessation of all letters and reports from Mr. Lewis and so on.

Chairman.—This is one where you start by saying "At our last meeting in Bombay I told Your Excellency that there seemed to be some misapprehension as to our position. Mr Lewis appeared to be regarded as the chief engineer in fact as well as in name, and at the meeting of the Advisory Committee I was not even introduced to the members"?

A.—Yes, that is the letter. Then there were enclosures which I promised the Chairman I would put in, and I am putting them in.

Sir H. Courthope-Munroe.—You conclude by saying " I have written this letter because I know how very interested Your Excellency is in everything connected with the Back Bay scheme and believe you would like to hear of any difficulties direct from me." You have got the letter of the 3rd June, have you not, Sir?

A.—I am afraid not.

Sir H. Courthope-Munroe.—If you have not I can give it to you.

Witness.—We have got notes of these letters.

Sir H. Courthope-Munroe.—It may be more convenient if I hand this bundle in.

Witness.—I have a bundle here. I can hand in the whole lot.

Chairman.—If the 3rd June letter begins " We desire to address you on the subject of the relationship," it is what I call the veil letter—" The veil appears to have dropped." I know that one.

Sir H Courthope-Munroe.—I am told there are two letters of the same date.

Chairman.—Sir George understands that it is the " veil " letter.

Witness.—Yes.

Sir H. Courthope-Munroe.—I think you have got all the letters you want now on that, have you not, Sir? Have you got the final letter of the 30th August, 1923?

Chairman.—No.

Sir H. Courthope-Munroe.—You ought to have that. That completes the chain of the four letters I have referred to. While my solicitor is finding it I will go on. (*To the witness*) I see, Sir George, that at the bottom of page 29 Sir Frederick Hopkinson puts this question to Sir Lawless Hepper, to which he readily assents : " I gather from this volume of correspondence and notes regarding the determination of the agreement with Messrs. Meik and Buchanan that Sir George Buchanan had really very little to do with the construction of the reclamation. Evidently they got out the original designs and thereafter practically did nothing?—(A.) That has always been my view." What do you say to that?

A.—I say that I think it has been stated here over and over again that the actual carrying out of the work was done by Sir Lawless Hepper as Director of Development, with Mr. Lewis as chief engineer.

Q.—It was not your job?

A.—It was not my job.

Sir H. Courthope-Munroe.—So it is true to say you did nothing. You got out the designs and thereafter did nothing. The carrying out of the work was their job and not yours.

Sir M. Visvesvaraya.—I asked for a list of plans and important reports or memoranda on technical matters prepared by Sir George after his preliminary report of 1919 was submitted. I have not had any definite reply. I do not know whether Sir George can enlighten us.

Witness.—We will supply anything we have.

Q.—I mean the list?

A.—We will give you the list.

Sir M. Visvesvaraya.—I want to know the definite work your client did for the scheme after that preliminary report was submitted. One of the criticisms is that after that preliminary report there was no important plan or estimate prepared by Sir George Buchanan.

Chairman.—All you want, as I understand it, is an index with the date and such and such a plan and another date and such and such a plan?

Sir M. Visvesvaraya.—Yes.

Sir H. Courthope-Munroe.—(*To the Witness.*) Do you understand that?

A.—Yes, I quite understand it.

Q.—Will you try to give it to Sir M. Visvesvaraya?

A.—Yes. It will take a few days, because I am afraid there are a great deal more than half a dozen or a dozen or two dozen, but it will be done.

Sir M. Visvesvaraya.—Only the important ones. I do not want many details.

Sir H. Courthope-Munroe.—Passing on, at page 30 there is a reference to the preparation of the estimates for the roads and for the storm water drains. You have explained the difference between the two estimates?

A.—I have explained that fully.

Q.—You always estimated for the storm water drains, but you did not estimate, except in the second case, for sewers?

Sir H. Courthope-Munroe.—There has been a little trouble there as to the meaning of the word " drains."

Chairman.—Again, Sir Harry, the matter is not quite so simple as that. Mr. Kidd got estimates from the Public Works Department showing that roads, lights and drains could be done for 59 lakhs. It is a most curious thing, but we have those estimates, and we cannot find that figure of 59 lakhs. We find the figure of 95. Whether that was a transposition in Mr. Kidd's report of 1912 we shall not know, but it is a very curious thing. The documents are here. The only figure we can find is 95. In Mr. Kidd's report it appears as 59. Sir George Buchanan neved saw those P.W.D. reports, but he put on an arbitrary amount of some 16 lakhs, and made it 75 in his report of 1919. He assumed that in the P.W.D. estimate were included storm water drains, I suppose?

Witness.—I did, certainly.

Sir H. Courthope-Munroe.—But you never intended to estimate for sewers, and you did not?

A.—Never.

Q.—But you intended the word " drains," where you use the simple word " drains," to include what we understand by drains plus storm water drains, but not sewers?

A.—I never intended it to include sewers.

Sir H. Courthope-Munroe.—If the figure you mentioned, Mr. Chairman, of 95 is a transposition of 59, then if Sir George, in making his estimate, merely added a percentage as an arbitrary figure, it ought to be added to the 95 and not to the 59.

Chairman.—That is the explanation that suggests itself. There is no figure of 59 lakhs in these original P.W.D. estimates which we have, but there is a figure of 95. Therefore one might possibly think that there had been a transposition of 5 and 9; but Sir George Buchanan never himself went into that estimate, nor did he ask for any revised estimate from the P.W.D. He took 59 as it was printed in Mr. Kidd's report.

Sir H. Courthope-Munroe.—Taking 59 and 95, there is over 50 per cent. increase straight away.

Chairman.—The increase was from 59 to 75, and subsequently the 75 was increased to 135, and there was added in pencil on that original document the words " storm water."

Witness.—And sewerage.

Sir H. Courthope-Munroe.—In any case, Sir George, this was a mere arbitrary figure, because your case is that until the scheme was developed and the site laid down any exact amount for drains could not possibly be got at?

A.—That is my view.

Q.—You want to know the length of the streets and the number of the streets, and various other things, before you can get an exact estimate. The next thing is at page 32. Again, continuing his search, Sir Frederick asks Sir Lawless Hepper, " if anything went wrong it was Mr. Lewis who would be responsible and not you, or the Government of Bombay? " Sir Lawless Hepper says: " No, I take it it would be Meik & Buchanan ". He will not take it himself; he will not take even the Government—it is you. Again you reply: " Scheme and agreement ".

A.—Yes.

Sir H. Courthope-Munroe.—Then I see Sir Frederick Hopkinson follows that up by saying, " And so it is Sir George Buchanan who comes in for the blame, and not the Government. I am asking you who is responsible?—(A.) I think the engineers." Here is one matter which is a little important to you, on page 33. I think, Sir M. Visvesvaraya was under a misapprehension as to the standing of your firm. He says the firm is only of a few years' standing.

Sir M. Visvesvaraya.—I understood that he had joined it recently.

Sir H. Courthope-Munroe.—In point of fact, your firm has been in existence for over half-a-century?

A.—Yes.

Mr. Billimoria.—Not as Messrs. Meik & Buchanan?

Chairman.—Sir M. Visvesvaraya no doubt had in his mind the fact that there had been a recent partnership of Meik & Buchanan.

Sir M. Visvesvaraya.—" Meik & Buchanan " was recent.

Chairman.—If you look at the original transcript you will see that Sir Frederick Hopkinson jumped in at once and said that the firm was of very old standing.

Sir H. Courthope-Munroe.—I am not complaining; I only wanted to clear it up. Following that the financial question was gone into. I think you have said, time and again, that finance was entirely outside your province, and that you never advised the Government on the financial question?

A.—That is correct.

Chairman.—Well, Sir George, finance was not entirely outside your province, at all events when you were dealing with Sir George Lloyd at the outset, because, if you remember in his letter he wrote to you and said that the two things he wanted you to advise him about were the feasibility of the scheme and whether, on present prices of dredgers, it would be a reasonable proposition?

A.—Yes, but I prepared my estimate. I had nothing to do with the advising as to the financial proposition. I never made any calculation whatever as to the profits.

Chairman—As long as that is made clear.

Sir H. Courthope-Munroe.—There is one other matter which I think you want to put before the Committee in some different way to that in which it has been presented hitherto, and that is this. It was put to you by Sir Frederick Hopkinson—I forget the exact language, but in effect it was that the scheme was a failure before it commenced. Sir Frederick Hopkinson will recollect the reference. Then Sir Frederick drew certain lines on the map and pointed out (correct me if I go wrong) that with the provision of 10,000 feet of piping, and with the provision of the dredger and the booster, there were certain parts of the land which had to be reclaimed which could not be reached. I think I have put it more or less accurately?

A.—That is right, yes.

Q.—That, as a proposition is true. I mean that there were certain portions of the reclamation scheme that could not be reached by the 10,000 feet, plus the dredger, plus the booster?

A.—Quite.

Q.—I want to get this: the actual area which you had to fill was 25,000,000 cubic yards?

A.—Yes. That is right.

Q.—There was a certain small portion on what is called the Marine Lines? There are two ends—the Colaba end and the Marine Lines end?

A.—As a matter of fact, I told the Chairman I would put in a statement about that.

Q.—Just follow me. I want to get it clearly. You have got to deal with a whole area of 25,000,000 cubic yards, is that right?

A.—That is right.

Q.—There was a portion of what I have called the Marine Lines which comes to 150,000 cubic yards?

A.—No, more than that.

Q.—How much is it?

A.—About 1,000,000 cubic yards.

Q.—That is a different figure from the one you gave me, but give it in your own way. What I want to get at is this. There are two points—the Colaba end and the Marine Lines end, where admittedly you cannot reach with the existing 10,000 feet and the dredger and the booster, but do they total up to a very small percentage of the whole?

A.—No, I do not say that at all.

Q.—What is the percentage?

A.—I cannot tell you at the moment.

Chairman.—You have given us a statement, have you not, Sir George?

A.—Yes. I do not know whether the statement is in yet, but I promised you a statement.

Sir H. Courthope-Munroe.—Then I will leave it.

Chairman.—You have certainly given us a statement with regard to it. I do not know if you propose to put in a supplemental one, but you have dealt with it in a statement you have given us?

A.—I should like to see that. I do not know which statement I have put in.

Sir H. Courthope-Munroe.—If you have put it in I do not want to take it in detail.

Chairman.—Leave it like that. Will you add anything you would like to about the matter, because if it is suggested that there was a very small area that could not be reached by the 10,000 feet we ought to have it scaled off and seen?

A.—Yes, I am perfectly prepared to do that.

Sir H. Courthope-Munroe.—Leave it for your statement, but take it on broad lines. Admittedly there was a portion of this area that could not be reached by the plant that you specified for. As a practical proposition, would any engineer specify for a plant,

especially when the plant is running into something like a quarter of a million for the dredger, which would definitely do a particular range all the way round? Would you not sort of strike an average?

A.—All I can say is that we did the best under the circumstances, and I prefer to leave it in that way and put in the statement.

Sir H. Courthope-Munroe.—If, when your machine has done its utmost with its 10,000 feet, there does remain here and there small portions——

Chairman.—33 per cent. and 25 per cent.

Sir H. Courthope-Munroe.—That is not my percentage? Is that your percentage?

A.—I should say that was about the percentage.

Q.—One-third. What is your answer to that? You spoke of having a second booster?

A.—I have put it all in the statement.

Q.—If it is there I will leave it.

A.—I will leave it at the statement.

Q.—On page 38 some questions were put by Sir Frederick Hopkinson to Mr. Brims. Sir Frederick asks: "Did he ask you to work 24 hours a day?" and Mr. Brims says: "Yes; before I came out here I said it was my intention to work 24 hours, if possible.

A.—That has been admitted. That is in the evidence. I do not think we need go into that.

Q.—Turning over to page 39, Sir Frederick asks him about the possibility of working 24 hours, and then he says: "During last year we were working nearly 18 hours a day, and we did 1,821 cubic yards per pumping hour for one week." I think upon that you say if he could do it for one week, why not for two weeks or more?

A.—Yes. He said in his evidence he had done 2,000 cubic yards. I say if he had done it for a week he ought to have done it for two months.

Chairman.—If the material of the same depth and same consistency of face was there.

Sir H. Courthope-Munroe.—Yes; but it is the fact that there was heaps of material, though not in any particular spot. Sir George accuses them of getting on to one spot and sticking there. That is the point you have been endeavouring to make?

A.—We have gone into that in great detail.

Sir H. Courthope-Munroe.—The letters show that.

Sir Frederick Hopkinson.—He would have to satisfy us that he ever did that quantity in that given time.

Sir H. Courthope-Munroe.—Mr. Brims would?

Sir Frederick Hopkinson.—Yes.

Sir H. Courthope-Munroe.—Sir George wanted to comment upon that. If the man says that with this much-maligned dredger, in point of fact they did over 1,800 cubic yards per hour in one week, on the face of it, why should not that go on?

A.—That came out in my evidence.

Sir H. Courthope-Munroe.—If the stuff was not there, obviously it could not go on.

Chairman.—You must not assume that we accept everything that Mr. Brims said.

Sir H. Courthope-Munroe.—I do not know what impression Mr. Brims made, as I did not see him. I do not know what impression he made on you.

Chairman.—Not a very good one, I am afraid.

Sir H. Courthope-Munroe.—Is there anything else in Mr. Brims' evidence you want to refer to?

A.—No; except Mr. Brims did not give nearly the whole of the experience he had in dredging.

Chairman.—That is unfortunate, because as he left it he seemed to be a man of practically no experience at all. You have seen that in his evidence?

A.—Well, we would like to put in a statement of Mr. Brims' experience showing he had enormous experience in dredging.

Q.—I think we should like to see that.

A.—We would like to put in his application for the appointment, in which he showed that he had very great experience in dredging.

Q.—Your firm so stated in letters to India—that he was a dredging master of great experience?

A.—Yes.

Chairman.—I have been rather puzzled about that because when he was asked his own experience he told us very little, and that experience began when he was a boy of 22, and seemed to have ceased very suddenly.

A.—We would like to put in his application.

Sir H. Courthope-Munroe.—Can you put your hand on it now?

A.—Not now.

Chairman.—Mr. Ewbank will make a note of that. We ought to see it.

A.—If Mr. Ewbank makes a note of any papers we shall be delighted to produce them.

Sir H. Courthope-Munroe.—I see on page 43 you have marked a question put by Sir M. Visvesvaraya: "When the scheme was embarked upon were you at all consulted by the Development Department or by the Government?" That was put to Mr. Neilson, and his answer was No. Do you wish to say anything about that? You have marked it in my copy as being important.

A.—No; I have nothing at all to say about that. In fact, vary many things have been dealt with in the evidence since we prepared this document.

Q.—That is why I am skipping page after page.

A.—I do not think there is very much more to say.

Chairman.—Really, at this moment, there is very little you can tell us. If there is anything Sir George can tell us now we are most anxious to have it.

Sir H. Courthope-Munroe.—I am doing it in this disjointed way to avoid taking up time. Will you look at page 45, where there is a question about this Wilson shovel? Is that anything to do with you?

A.—Nothing at all. That is all on the record, if I may say so. We have discussed that.

Q.—You want to draw the Committee's attention to the fact that the Wilson shovels were bought against your specific advice?

A.—Yes.

Chairman.—I have made that point; but is it Wilson or Whittaker shovels? Is not it Whittaker shovels?

Sir H. Courthope-Munroe.—They are called Wilson here.

Chairman.—They are called Wilson and Ruston, but I believe they are Whittaker.

Sir H. Courthope-Munroe.—Still, having got them, you do not see why they should not have made some use of them?

A.—No; I do not think they could make any use of them.

Chairman.—As shovels?

A.—As shovels.

Sir Frederick Hopkinson.—I believe they are Whittakers, from my recollection of their appearance; but the plant list does not show which they are.

A.—We can find out.

Chairman.—It is only to get it right?

A.—Yes. Then the next thing is at the bottom of page 46.

Sir H. Courthope-Munroe.—You draw attention to a question put by Sir Frederick to Mr. O'Rorke: "Do you think any contractor would have given a price for doing the work upon the materials available in 1919?" What do you want to say about that?

A.—No one suggested that a contractor should go and give a price upon the report of 1919.

Q.—On page 48 I think you ought to say a word about the costing account.

A.—Well, I think we all know about the costing account.

Q.—You have letters here in which you were complaining about the absence of costing accounts?

A.—Yes.

Sir Frederick Hopkinson.—Any language Sir George could use in connection with that matter would not be half as strong as the language I should use.

Sir H. Courthope-Munroe.—I say no more, and I pass from it.

Sir M. Visvesvaraya.—I wish to endorse that statement also.

A.—There is our letter on the subject.

Sir H. Courthope-Munroe.—Do you remember the date of it?

A.—No. We can put it in. In one of my reports I wrote and pointed out there were no costing accounts. My firm then rubbed it in by writing another letter to Sir Lawless Hepper emphasising the fact that there were no costing accounts.

Sir Frederick Hopkinson.—I think we have got those letters.

Sir H. Courthope-Munroe.—That is a letter of the 13th April, 1922, in which you say : " While concurring generally with the report, we particularly desire to notice and emphasise the paragraph concerning the engineering staff and engineering accounts. It is impossible to carry out efficiently large public works without adequate engineering staff, and it is equally impossible to exercise economy without a proper system of costing accounts." Is that the letter you mean?

A.—Yes.

Chairman.—We have not that actual letter of the 13th April, 1922.

Sir H. Courthope-Munroe.—It is an important letter sent by the firm to the Director of Development. Then in the concluding paragraph he says : " We received by the mail which arrived here on the 3rd April the chief engineer's letter dated the 17th March, enclosing an indent for additional plant and machinery. Tenders are being taken in for the whole of the indent, and we have in our letter to the chief enginner dated the 11th April, 1922, questioned the necessity for some of the plant, and have asked him to take our orders." That is what you want to lay stress on?

Chairman.—We have brought all that out, but we ought to have that letter.

Sir H. Courthope-Munroe.—I will have a copy of it made and let you have it. Then on page 15 you have marked something about moorum. Do you want to add anything to that?

A.—No ; so many things have been dealt with since we prepared this on the Bombay evidence, and it is all on the note.

Q.—If you say no I will pass on at once. Turning to page 51, I think there is a point which has not been put. Sir Frederick Hopkinson asked Mr. Elgee : " Do you not have any specification giving particulars of the constituent parts of the concrete? " and the answer was No. What do you say about that?

A.—We have already said that there are specifications. If they were not used it was the chief engineer's fault.

Q.—This answer, to put it no stronger, is absolutely incorrect?

A.—Absolutely incorrect.

Sir Frederick Hopkinson.—My question was to Mr. Elgee, who was in charge of the construction of the sea wall.

Sir H. Courthope-Munroe.—I am not complaining of your asking the question, but the answer given is incorrect. I do not want to use the word " untrue," but it is absolutely wrong. There are specifications, and they were pigeonholed somewhere in Bombay.

Sir Frederick Hopkinson.—What Mr. Elgee said was that he had not had it.

Sir H. Courthope-Munroe.—You asked him : " Do you not have—— "

Sir Frederick Hopkinson.—" Did you not have—— "

Sir H. Courthope-Munroe.—" Do you not have any specifications giving particulars of the constituent parts of the concrete? " and he says " No." He does not say he has not individually got them.

Sir Frederick Hopkinson.—That was a staggering answer to me.

Sir H. Courthope-Munroe.—I should think so, but the answer to it is that they were supplied.

A.—They were supplied with the specifications to the resident engineer——

Sir H. Courthope-Munroe.—Whether they got into the waste-paper basket or a pigeonhole you do not know.

Chairman.—When you are giving an index of the plans and specifications you might star the one which contained the specification for concrete, so that we shall know.

A.—I will.

Q.—Just put a little note in the margin : " This is in relation to the concrete."

A.—Yes. Then go on to the bottom of page 54.

Sir H. Courthope-Munroe.—What do you want to say about that?

A.—That is estimates.

Q.—Do you want to say anything in passing about this caterpillar business?

A.—No.

Sir H. Courthope-Munroe.—There has been a misunderstanding about that. Sir Frederick let himself go at the Witness on that, but it is probably a misunderstanding as to what actually took place.

Chairman.—We will pursue it if you like, because I have taken great pains to find out how a caterpillar tractor functions, and I can explain it to you ; but I think it would be better to pass it by.

Sir H. Courthope-Munroe.—Obviously. I am not in the least desirous of going into that. It is simply a misunderstanding about it. Going to the other point about Mr. Kidd, that is at the bottom of page 54?

A.—Yes.

Q.—What do you say about that?

A.—I would like to say a word about the caterpillar. The way it arose was that the Chief Engineer wanted to spend more money. He came to me with proposals for buying this caterpillar.

Chairman.—It was the Bucyrus?

Q.—What happened was they got the Bucyrus, and they wrote that there is some difficulty about this, because the tractor, the Bucyrus, we have got is not the same as the track and they suggested for something like 11,000 rupees it could be converted into a caterpillar tractor; and then they discussed caterpillar tractors; that is how it arose.

A.—The Chief Engineer asked me to get it at home. It was more expenditure on plant. I did not want to get it. I went up to the man at the quarries, O'Rorke, and asked him what use he could make of it That is the whole thing in a nutshell. Then I come on, at the bottom of page 54, to the details of estimates.

Sir H. Courthope-Munroe.—What do you want to say about that? This is the old question as to whether your report was in more detail than Mr. Kidd's?

Q.—Just put that in a few words, if we have not exhausted it?

A.—I will.

Sir Frederick Hopkinson.—We have got both, and we can compare them?

A.—No, I disagree. I would like to say something about the preparation of my 1919 report and about the comparison with Mr. Kidd's. I would like to talk five minutes about my 1919 report, as I think it would be useful.

Chairman.—Please do.

A.—Some Engineers are frequently asked to report upon others' schemes; and in this case I was asked to report upon Mr. Kidd's scheme. Very well. When I received Mr. Kidd's scheme, I found it was extraordinarily lacking in detail. There were no quantities, and there was nothing by which I could find out how many hundred cubic yards of concrete, or how many million tons of stone, and so on, were required. His report said " so many lineal feet of wall " ; but there were no particulars given about the dredging plant whatsoever. For a report which had been accepted by the Government of India as so full of detail that work would at once be proceeded with upon that report, I found it exceedingly deficient in detail. I had to take Mr. Kidd's report, and I had to take out the whole of the quantities from Mr. Kidd's drawings and from my own schedules; so that my report, which was not supposed to be a detailed report, was crammed full of details in comparison with Mr. Kidd's report. I would like to point out that Consulting Engineers, when they write reports of that nature, do not write detailed reports. The only fault I have to find with my 1919 report is, that it is extraordinarly full of detail. In fact, it has got a very great deal too much detail for a report of that nature. The scheme had not been sanctioned. It was in contemplation. An Engineer writing a report on a scheme which has not been sanctioned, as a rule puts as few details as possible. I thought it would interest the Committee if I gave you two examples. You have not had the advantage of taking any evidence from Consulting Engineers in Westminster, so that you have only to take my opinion of their practice. But here is a report which Mr. Meik wrote in 1897 to Sir Weetman Pearson, who was proposing to build a large harbour at Santa Cruz. He is reporting on another Engineer's report, but here is the report. I suppose it was satisfactory. There is no single detail of costs in the report. (*Document handed in.*)

Sir Frederick Hopkinson.—What is the date of that?

A.—1897. Here is another report. I would rather not mention names. This is a report from a very famous firm of Engineers on a very large public works, and as far as costing is concerned you will see there what details of costing are given. (*Second document handed in.*)

Mr. Billimoria.—Could these reports be said to be on all fours with the report you made? Surely the position and the circumstances at Bombay were different?

A.—The report is on all fours.

Q.—The Governor had been entirely dependent on your report, and he wanted an exhaustive report with advice from you?

A.—The report would have been just as exhaustive with so many figures. I should like to clear up several points in connection with this report. I have been examined repeatedly as to the time I spent in Bombay. I suggest that there is some confusion in the minds of the Committee as to what constitutes an Engineer's estimate and what constitutes a Departmental Contractor's estimate. I was not preparing a Contractor's estimate. It was not any part of my business at that stage, when the scheme was

under consideration, to go into questions in detail about where the stone is obtained, and analyse the cost of labour in detail. We never do. You can get evidence from all Westminster on that point. The scheme was not even sanctioned. Obviously after my report had been received, then if the work had been let by contract, the contractor would have done all that work before he put in a price. As it was done departmentally, the work which ordinarily would have been done by the contractor fell to the Development Directorate through their Chief Engineer and their Director. My report was an Engineer's report upon Mr. Kidd's scheme. I had his surveys and all his data, and the Government of India had approved of them up to the hilt. Then when I arrived in England, I took out, as I have already described, all the detailed quantities and material from Mr. Kidd's drawings, not from his report, because they were not in his report at all. I had to take them out from his drawings, in order to analyse his report. I affixed prices to the schedule in accordance with our experience of similar work, and the data I had obtained in Bombay. That is the universal way in which an Engineer prepares his estimates. We do not go into details. We consider the less detail as a general rule that we put in our preliminary reports the better. That is all. I merely wanted to describe the procedure in preparing these reports.

Chairman.—You have given us much the same evidence on the third day of your evidence at page 9, in which you gave us the figures, and told us exactly how you got your totals out.

A.—Yes. I wanted to emphasise it, because I feel very much the suggestion that I in any way whatsoever neglected the preparation of that report.

Sir M. Visvesvaraya.—May I ask you one or two questions in this connection? Mr. Kidd's report and estimate were not intended to be final. A detailed estimate was to follow.

A.—They were so final that the contract was going to be let upon them.

Q.—But it promised a detailed report later on at Bombay.

A.—No, I think not.

Sir Frederick Hopkinson.—There is a paragraph in which Mr. Kidd said he would want 5 per cent. after the estimate had been checked—after the final estimate had been made and checked.

A.—At all events the Government of Bombay said that the report was clear and complete. All the detailed points had been settled, and the revised estimate might be accepted as completely trustworthy and ample. My point is that the Government of Bombay could not possibly have criticised it as trustworthy and ample unless they did what I did, and took out all the quantities.

Sir M. Visvesvaraya.—Mr. Kidd did not give the details of the project to the Government of Bombay.

A.—It was purported to be detailed.

Q.—He withheld details from the Government of Bombay; he did not give them.

A.—No, he did not give details; but the Government accepted it.

Q.—How could they accept the estimate without the details as a final working estimate?

A.—The Government of Bombay, on the 7th August 1912, wrote to the Government of India and said: "With reference to Messrs. Lowther & Kidd's report, the drawings might be considered as complete working drawings. They would give sufficient information for the examination of the designs and the immediate commencement of the work. The investigation had been most carefully made, and might be accepted as exhaustive. The report was clear and complete. The revised estimate might be accepted as completely trustworthy and ample."

Sir M. Visvesvaraya.—But details were to follow. That was not to be the working estimate.

A.—I do not know. There is nothing in that letter to say that.

Sir M. Visvesvaraya.—The details were not given.

Mr. Billimoria.—Did they not conclude that letter by saying: "It will require further detailed investigation"?

A.—That came much later on, with another Government in Bombay; and I pointed out at the time to the Chairman that it was inconsistent. In fact, when you were examining me, we discussed the question of inconsistency.

Q.—That is what I recollect.

A.—I have nothing more to say on that point.

Sir M. Visvesvaraya.—Anyhow, the details were not given, and without the details no estimate could be considered as final and complete. Another point is this: You stated in your report that the estimates given by you were reasonable and reliable.

A.—Yes; and I still say they were reasonable and reliable.

Q.—Reasonable and reliable?

A.—Yes.

Q.—But the details were not there?

A.—The details were there. The details were all in my report which were not in Mr. Kidd's report, which should have been in Mr. Kidd's report. I furnished the whole of the quantities.

Q.—But as soon as your report was furnished and the work was begun, did you also give to your Resident Engineer or Chief Engineer independent orders to proceed with detailed estimates and plans?

A.—We at once proceeded with what we had intended to do—working out the contract drawings, the rates, and so on, with the Colaba contract, and the Director of Development and his Engineer went on with detailed estimates on the basis of Contractors' estimates for the Kandivli quarry.

Q.—I want to know whether it required such a long time as nearly two years to prepare a detailed estimate for a project where there was one sea-wall and some amount of filling?

A.—Sir Frederick Hopkinson asked me that question, and he said that a contractor would do it in a few months. I said: Yes, a contractor would do it in a few months, or a few weeks; but the way the things were done in Bombay, under the rules of the Government of Bombay, it would probably take two years.

Sir Frederick Hopkinson.—The real point of the matter is this: As you know, prices were jumping about in 1920 and 1921?

A.—Yes.

Q.—An estimate made in January 1920 might be absolutely useless by the end of the same year?

A.—Yes.

Sir M. Visvesvaraya.—But you must have estimates.

Sir Frederick Hopkinson.—I know; but if you take two years to get out the estimate, by the time you finish it the prices would be entirely different, and you have got to begin all over again.

A.—I am very glad to hear you say that and confirm what I have said on that point.

Sir H. Courthope-Munroe.—At this period of time, everything was absolutely abnormal. There has hardly been a period like it in the history of the world, I should think, so far as prices were concerned.

A.—That is all I want to say on the estimate.

Q.—Then going on, on pages 55, 56 and 57 there is nothing of any importance.

A.—As the Chairman says, we have covered so much ground in the examination that there is very little left.

Q.—That is why I am hurrying on. I do not think we are wasting time now. I have a note on pages 60 and 61 about this estimate and the 11 crores. I do not know whether you think that subject is exhausted?

A.—Well, I would like to say something about that.

Q.—Just tell me it briefly. This is the somewhat pertinent question put by Sir Frederick Hopkinson in dealing with these 11 crores. He says: "Then it is not an Engineer's estimate?" And Mr. Elgee says: "It is not. It was on a very pessimistic view. It was based on the season's dredging, which we knew could be improved. I do not call that an estimate, although we have put it up at that figure". Then Sir Frederick says: "Who wanted you to put it up?" And Mr. Elgee says: "That was prepared by the Advisory Committee". The only inference from that is that the Government, in the opinion of Mr. Elgee, is not entitled to accurate information. That is the corollary you draw from it?

A.—My point is that when the Government of Bombay began to get alarmed by the Back Bay scheme, they appointed a Committee of Investigation, under the Chairmanship of Sir Lawless Hepper, to go into the matter. This Committee, under the Chairmanship of Sir Lawless Hepper, had no difficulty in attributing the whole blame for everything that had possibly happened to myself, and they produced an estimate showing the probable cost of the works at 1,100 lakhs, and the date of completion to be 1944-45. Well, in view of what Mr. Elgee has said I say that this estimate of 1,100 lakhs—it is a nasty word to use—was in the nature of a fake. It was not an Engineer's estimate, it was not a proper estimate; it was not an estimate that ought to have been sent forth to the world as the final conclusion of the Government of Bombay as to the cost of the scheme.

Mr. Billimoria.—In that connection I asked you a few questions. I asked you what length of time you put for the completion of the scheme, and what would be the amount at which you would complete it, and you said it was impossible for you to answer those questions.

A.—I said it was impossible for me to answer those questions because I have ceased to have anything to do with the scheme, and I have not any of the data at all at my disposal. That is the reason.

Q.—I asked you that question particularly with regard to these remarks of yours.

A.—Yes, but I have not the data. The Chief Engineer of the scheme in reply to a question of Sir Frederick Hopkinson who says: "One gets nauseated with these figures. You are putting the Government in an awkward position," says: "It is not an Engineer's estimate. It was based on a very pessimistic view; it was based upon a season's dredging which we knew could be improved."

Chairman.—But the point may be that the Advisory Committee did not accept Mr. Elgee's optimism about the improvement. After all it was a figure put forward by the Advisory Committee. Mr. Elgee has now put forward a reduced figure of 1,000 lakhs.

Sir M. Visvesvaraya.—That is because the working of the dredger has improved.

Chairman.—Exactly, but the Advisory Committee pledge themselves to 1,100 lakhs even though Mr. Elgee thought that was a very pessimistic view. They said you and your dredger have done 1,020,856,959 yards on the three years' pumping hours instead of 2,000, and in working it out on a basis of 941 yards, the average, it will cost 11 crores, and it will take another 20 years.

Sir Frederick Hopkinson.—They were not satisfied they were going to improve upon it.

Chairman.—They did not believe in Mr. Elgee's optimism.

A.—They do not give all this in their report. They give it as an engineer's estimate, and the engineer comes along and says that it was not his estimate at all. However, I will not labour the point.

Q.—There is not much importance to be attached to the 11 crores.

A.—No.

Sir H. Courthope-Munroe.—As you have mentioned this report (I was going to deal with it at a later stage) I will put two or three questions on it to you now and get rid of it. This is a report of the Advisory Committee dealing with the Back Bay reclamation scheme. Curiously enough in view of the developments of this inquiry, Sir Lawless Hepper was the Chairman of it.

A.—Yes.

Q.—As the real victims seem to have been you, Sir Lawless Hepper and the Chief Engineer—those are the people who are to bear the brunt of it—it is curious that he was made the Chairman of this Committee.

A.—Yes.

Q.—Then I see the Committee reported by a majority of 1 that they were of opinion that "the main responsibility must rest with him"—that is you, Sir George—"for the predicament with which the Government is now confronted." Sir Lawless Hepper was one of them who signed that report of a majority of 1?

A.—Yes.

Q.—Then, like many other reports, I see it had a minority report—it is a minority less the 1—in which they say: "We cannot agree with the majority that the main responsibility must rest with Sir George Buchanan for the predicament in which the Government now finds itself. We are of opinion that the whole responsibility rests with the Government." That was the outcome of it. So if you eliminate Sir Lawless Hepper, the Chairman, it is honours easy. Do you want to say anything more about that?

A.—No, I do not want to say anything further about that; I have exhausted it.

Sir Frederick Hopkinson.—The only thing you might say about that bulky volume is, it is a pity that words will not dredge.

Sir H. Courthope-Munroe.—Then on page 62 there is another searching observation by Sir Frederick Hopkinson about these estimates. He says: "Supposing you are to make an estimate to Government to carry out certain work, and you were asked to give an estimate of what you thought it would cost, what would be your inclination?—(A.) It would be on the safe side.—(Q.) To make it high?—(A.) Yes. So that the whole estimate of cost would really be of little value because the Government would judge if you are going to carry it out departmentally on the nearness of the estimate to the actual cost."

Chairman.—Sir George has dealt with that.

Sir H. Courthope-Munroe.—Very well. Anyhow, you wish to stress that?

A.—Yes.

Chairman.—If the man who estimates is the man who has eventually to do the work, it has been suggested—and we accept it—that it is human nature to be on the safe side.

A.—Yes.

Sir Frederick Hopkinson.—I am simply criticising the principle of it.

Sir H. Courthope-Munroe.—Sir Frederick points out it destroys the meaning of the word " estimate."

A.—The only point I would like to stress is this. Having made this very legitimate criticism of the methods in India of making very, very ample estimates, which I think Sir Frederick called a comic opera business, the harmless remark in my report, " that I never over-estimated because I did not think it was conducive to economy," Sir Frederick was equally discontented with. I say, he cannot have it both ways. That is all I wish to say.

Q.—When you are cross-examined you want it both ways. Then on page 64 you deal with extravagance and inefficiency, and we have heard enough on that. Then on page 66 do you want to lay any stress on that at all?

A.—No; we have dealt so fully with all these points.

Q.—As Sir Frederick put it to the Witness, under the old state of things was not the Chief Engineer in direct control of the whole scheme? Then you refer to the wording of the agreement in Lord Lloyd's evidence, and to the scheme itself.

A.—That is page 67.

Sir H. Courthope-Munroe.—That puts it in another way, as Sir Frederick himself put it to Mr. Elgee, " he was in fact "—" he " is " you " in the context—" just in the position of a contractor, and the Chief Engineer is in the position of a contractor's agent." That is the whole point I was trying to hammer on Saturday.

Chairman.—We heard your argument on that.

Sir H. Courthope-Munroe.—That is the view I expressed on Saturday: do you agree with it?

A.—Yes.

Q.—In no sense could Mr. Lewis, or subsequently Mr. Elgee, be deemed to be your agent?

A.—No. I would like to make one or two remarks on this question, because I think the Chairman was not quite clear that we did not have some contractual obligations.

Sir H. Courthope-Munroe.—I do not think you need say that after what the Chairman said on Saturday.

Chairman.—You mean some obligation in the nature of a contractor's obligation, not contractual?

A.—Of the nature of a contractor's obligation?

Q.—Yes.

A.—I should like to say a few words about that. Sir Frederick Hopkinson when he examined me gave me a number of examples—I forget what they were in detail—as to how the firm really took the place of a contractor. He said we designed the gantry for the sea wall, temporary work which would be done by a contractor in a preliminary report before the scheme was sanctioned. I certainly suggested a plan of operations involving a gantry. Again I showed greater interest and gave more information than was absolutely necessary. In future I must cut my reports and not give nearly so much detail. But supposing the work had been let by contract, obviously it would have been open to the contractor to make any alternative suggestion he chose, but the work being done departmentally, my advice was followed and the work carried on. Then we were told we purchased plant and machinery, that being a contractor's job. We purchased plant on indents furnished by the Development Directorate, and that practice is followed by every consulting engineer in Westminster. To my certain knowledge the Bombay Port Trust and the Calcutta Port Trust have their consulting engineers in Westminister. Whenever the Port Trust require machinery and plant they indent on their consulting engineers who do exactly the same as we did for the Development Directorate. The Calcutta Port Trust are carrying out a large part of a dock scheme departmentally—that is, they are their own contractors—and when they require plant, their consulting engineers in Westminster purchase on indents and send it out. Then we are told because we engaged the staff, a contractor would also engage staff; but the same analogy applies. The consulting engineers to the Calcutta and Bombay Port Trust, and all consulting engineers in Westminster, engage staff for their clients and send the staff abroad. The difference between the usual consulting engineer and ourselves is that as a rule they purchase the plant and send out the staff entirely on their own discretion when asked to do so by their clients, whereas we worked through the High Commissioner for India and the Director-General of Stores. Where we differ essentially from contractors is that we order plant on requisitions; we had no power of discretion, and when as advisers to Government we protested against what we thought extravagance we were

overruled by the Director of Development. We had no control over expenditure in any shape of form; we had nothing whatever to do with the employment of labour, the rates of pay, the letting out of the numerous sub-contracts, the purchase of local materials and stores, and, lastly, we had no power to appoint or discuss any member of the staff or the workmen. That was done by the Chief Engineer in consultation with and taking orders of the Director of Development, and we simply did not come into it at all. Repeatedly in addressing the Chief Engineer or the Director we emphasised the fact that they took the place of the contractor. We used these actual words: "In matters connected with the actual execution of the work we have no authority to interfere with the Chief Engineer's discretion."

Chairman.—Where do you use that phrase?

Sir H. Courthope-Munroe.—I can give you the reference.

A.—It is page 82 of my statement.

Sir H. Courthope-Munroe.—It is on page 91 of the evidence given on Tuesday, the 2nd November. It is only a few questions, and I would like to read it because it is an important point.

A.—There is one more point. In my annual report dated 11th February, 1922, where I went very fully into matters, I made an excuse for expressing my opinion freely by quoting our agreement, which says: "The firm shall at all times assist and advise the Government of Bombay in all matters relating to the execution of the work." That is all.

Q.—Let me just read half-a-dozen questions, and then see if you have exhaustively dealt with it. Sir Frederick Hopkinson said this: "On this question of control I should like to ask you this. In the case of a work of that kind let to a contractor would he design and buy the dredger and take it out in the ordinary way? Suppose you let the work to a contractor, he would design and purchase the dredger?—(A.) That is a matter of arrangement. (Q.) Suppose you let anyone the contract at so much a yard?—(A.) Yes, of course he would. (Q.) He would have a dredger designed, and would buy the dredger?—(A.) Yes. (Q.) He would design the gantry for building the sea wall?—(A.) He would. (Q.) He would settle on what plant was to be used generally throughout the work, locomotives and cranes?—(A.) He would. (Q.) He would also purchase all the plant?—(A.) Yes. (Q.) Or requisition it?—(A.) Yes. (Q.) And he would engage all the staff?—(A.) He would. (Q.) Settle their duties—he would make the dredging programmes?—(A.) Yes. (Q.) He would decide where and how the dredger were to work?—(A.) He would; he would do all those things. (Q.) He would approve or disapprove of buying more plant if it were required?—(A.) Yes. (Q.) All those things you have done." That is what you were on?

A.—Yes.

Q.—You have exhausted that?

A.—I have nothing to add to what I have said. The crux of the whole matter is that the contractor has command of the purse strings.

Q.—Let us leave that and pass on to page 68. There is a matter you wanted to put before the Committee about the moorum. Somebody suggested at some stage that the excavation should be filled up by moorum instead of dredging, and there was a point you wanted to mention about the transport of moorum to the place. It is a question put by Sir Frederick to Mr. Elgee. He refers to your letter in which you say: "We cannot say that we are surprised at the figures and quantities. Calculations made some time ago in this office show that at the present rate of progress the reclamation will be completed in 35 years." You wrote that as a bit of witty sarcasm?

A.—Certainly.

Q.—It rather shows the danger of written sarcasm. Verbal sarcasm may be all right, but when you put it down in black and white it may be misunderstood. You never suggested for a moment that you were going to be a party to this thing taking 35 years?

A.—No.

Q.—You put it in that lurid way in order to draw attention to it?

A.—Yes. It was an attempt to spur them on.

Q.—It was an attempt to spur them on; but written sarcasm is a dangerous weapon. Then you draw attention to this: "There have been two figures, among others, mentioned in connection with the estimates, the figure of 688 lakhs, and 702 lakhs." Sir Frederick says in a lordly manner that there is not much difference between 688 and 702 lakhs; but you point out in round figures it is a quarter of a million of money.

A.—I do not think we need labour that.

Chairman.—We went into that—688 plus 5 per cent. is 702. It was only 5 per cent. difference between Sir George Buchanan's and Mr. Lewis's.

Sir H. Courthope-Munroe.—On the note it runs : " Sir Frederick saying : ' There is not much difference betwen 688 lakhs and 702 lakhs'."

Sir Frederick Hopkinson.—5 per cent.

Sir H. Courthope-Munroe.—It actually works out at something like a quarter of a million of money. A quarter of a million is an important figure even for a contractor to to take notice of.

Sir Frederick Hopkinson.—But when you are dealing with large figures you must take the percentages.

A.—I do not think we need deal with that.

Q.—All right. Then as to the " Kalu " and " Jinga," you told us you did not recommend their purchase, and I think in connection with some part of the work you used the word " disgraceful."

A.—I did.

Chairman.—About the " Kalu " I think Sir George did agree that he recommended its purchase, but that was probably for the East Colaba reclamation which fell through, but in terms he eventually agreed that he recommended her as a suction dredger, but he qualified it by this, that before she was agreed to be purchased she ought to have been examined. That is the point?

A.—Yes.

Sir H. Courthope-Munroe.—Am I right in saying that for the cost £75,000 plus £25,000 repairs, you could almost get a new one?

A.—Yes, you could.

Sir Frederick Hopkinson.—Not at that time. She originally cost £65,000.

Sir H. Courthope-Munroe.—You know more about these things than I do, but I thought that was the fact. If Sir George had known it would cost £75,000 and you had to put on £25,000 repairs to that, he would have said no.

Sir Frederick Hopkinson.—She originally cost about £65,000.

Chairman.—I think it is £56,500.

Sir H. Courthope-Munroe.—It is another example of the way that prices were jumping up.

A.—Then shall we go on to page 78?

Sir H. Courthope-Munroe.—Anyhow, you say apart from the purchase of it the management was absolutely and entirely a matter for the dredging masters?

A.—Yes.

Q.—There is something in Mr. Speirs's evidence about working the dredger?

A.—We have dealt with that.

Q.—And Mr. Merrett's also?

A.—Yes. Then page 78.

Sir H. Courthope-Munroe.—Then on page 82 this same sarcastic observation of yours crops up : " That the work would go on to 1960."

A.—Yes.

Q.—You did not suggest that was business. Then on page 38 there is a mistake. It is suggested that you were the man who selected the site. Is that right?

A.—No; I did not select the site. I understand through the Chairman that the Committee see that I was not responsible for the site on which the dredging operations were to take place, and the neglect of the Government to ascertain that the Port Trust had certain powers.

Q.—Then on page 85 you have commented upon whether there should have been a land station, or whether the booster should have been on the water.

A.—I do not think I have anything more to say about any of those points.

Q.—Then there is a reference on page 86 to the wonderful natural siltation referred to in paragraph 19 of the Sub-committee's report. Do you want to say anything about that?

A.—No; I have already expressed my view about that. There is a great deal of repetition here.

Q.—That is why I am running it through rapidly. Is there anything on page 87?

A.—No.

Q.—Do not touch on anything which you do not think is necessary. On page 89 there is a reference to the moorum and to the railway facilities. Sir M. Visvesvaraya put a question about that, and at one time you thought that it wanted a little clearing up. Will you just see whether you want to say anything more about that?

A.—I have nothing to say, except for Sir M. Visvesvaraya's information I may point out that Mr. Lewis, the chief engineer—I hoped to have his letter here, but I

will put in his letter—wrote a letter on the subject of moorum and went into the question of the number of trains required and the quantity that each train would take, and his figures were most disappointing. If it is of any interest I can put his letter in amongst the papers.

Chairman.—What date would that be?

A.—That would be somewhere about 1922.

Sir M. Visvesvaraya.—I should like to have that.

A.—Sir Lawless Hepper had prepared a scheme for doing it, and he was going to have a new railway and a large tunnel across the island. You have not got that, perhaps?

Sir Frederick Hopkinson.—We have got that somewhere.

Chairman.—We have had a suggestion of a tube railway which should be handed over to the people of Bombay as a further piece of the beneficence arising out of this work.

A.—Yes.

Sir Frederick Hopkinson.—A tube railway taking about 20 years to complete, and then the reclamation would be begun.

Sir M. Visvesvaraya.—There is a scheme for a tube railway in Bombay.

Sir Frederick Hopkinson.—But this was to bring the moorum down.

Sir H. Courthope-Munroe.—On page 93 I see an answer was given by Mr. Elgee which is a little illuminating. Sir M. Visvesvaraya says this : " If Sir George Buchanan did not give the specification why did the engineers on the spot not do it? " The answer given by Mr. Elgee is : " One reason is that at the commencement of the work Mr. Lewis was very busy, and he gave us a free hand, more or less, in the working." You might paraphrase that by saying that Mr. Lewis did nothing.

A.—He had the specification in his possession. Two copies were given to him.

Sir H. Courthope-Munroe.—For the man who is in charge to give a sort of, what is called, a free hand in working, is another way of saying he is doing nothing.

Chairman.—You must remember the reason. Mr. Lewis, immediately after his return from London, begun to get out his project estimate; and that was published early in 1922. It was a gigantic labour, and Mr. Lewis, instead of being able to go about the works and energise this man and push on the other man, and be at Kandivli in the morning and at Marine Lines in the afternoon, was chained to the office. To get out that detailed project estimate was an enormous labour.

Sir H. Courthope-Munroe.—I understand that. Of course you have had the advantage of knowing what has happened earlier on in this inquiry?

A.—If he had not been tied by the rules and regulations laid down in the Public Works Department, Code By-laws 1, 2, and 3, as to how the estimate should have been got out, he would not have been tied. There are heaps of large works—and Sir Frederick Hopkinson will bear me out—that are started on very meagre information, and the details are worked out step by step as the work proceeds. You do not necessarily do as the Government of India does. The situation may be changed entirely next year. The Government were insisting on their putting everything down on paper—" everything before we let you start," although it might be a waste of paper in six months' time.

Q.—Is there anything you want to say about page 96?

A.—That is a question put by Mr. Billimoria. Mr. Billimoria, on the information available in Bombay, suggested : How should an engineer of repute and standing make such colossal mistakes? With all due deference to Mr. Billimoria, I hope that he has changed his mind since he has heard the London evidence; and I wish to say I do not admit making colossal mistakes; and I hope Mr. Billimoria's opinion was framed on what everyone was saying in Bombay at the time. That is all I have to say about that.

Q.—That brings us to the end of this part. You have made a note about the evidence given by Mr. Walsh and Mr. Hirachand?

A.—I think we have dealt with that.

Q.—That concludes all I want to ask you about the Bombay evidence?

A.—Yes.

Chairman.—It had better be made clear that when you refer to page 3, or page 5, or page 8, and so on, you are referring to a document which no member of the Committee has, but which is a document which is brought into existence for your use in the examination of Sir George Buchanan.

Sir H. Courthope-Munroe.—Yes.

Chairman.—The reference which you have given will not be to these pages of evidence.

Sir H. Courthope-Munroe.—That is so. You will appreciate that the little book I have got before me has 98 pages, and the Bombay evidence has been boiled down to that. You will know the number of pages of evidence that I have dealt with. If I had waded all through that it would have been a question of days; therefore I purposely reduced it.

Chairman.—It is only that somebody reading the evidence should not hurriedly turn to page 18 of the transcript and not find the reference.

Witness.—The boiling down of the evidence was done before my examination, so that we were just going over it to see that nothing was missed.

(*Adjourned for a short time*).

Sir H. Courthope-Munroe.—I have had a copy made of the letter of the 13th April, 1922, and it will be handed in. (*Letter put in.*) (*To the Witness.*) We are now nearing the end of our labours. Will you turn to the London evidence. I think you have gone through it since lunch, and you have further reduced the questions. Will you turn to page 3. I think you want to refer to the question in the middle of the page?

A.—That is right.

Q.—It was suggested, I think, that you took Mr. Kidd's report holus bolus, and that is what is still rankling in your mind. What do you say about that?

A.—No, it is not rankling. I only suggest that the statement that I took Mr. Kidd's report holus bolus was made before I had given any evidence, and I think it is quite clear now from all the information that I have given that I did not take his report holus bolus. I have nothing more to say.

Q.—I think we can now turn on to page 7. I have referred to this already. This is what Sir Henry Lawrence said in answer to Sir Frederick Hopkinson?

A.—We have already referred to that.

Q.—I have referred to it, but it emphasises that there was some difficulty with the crew, some of whom had to be replaced?

A.—Yes.

Q.—Sir Henry Lawrence says: "Some of them had to be replaced on the vessel because their work was unsatisfactory in every way. Fresh men had to be trained in the following year"?

A.—Yes.

Q.—Now will you go to the middle of page 8?

A.—Yes.

Q.—It is the same old story?

A.—It is the same old story. I can hardly think that Mr. Billimoria, after having heard me, would still subscribe to the statement that I "followed blindly the report and figures of Mr. Kidd."

Q.—That follows the holus bolus suggestion. I think we can pass on?

A.—Yes.

Q.—You have given your explanation of that. We can now skip several pages. I think you desire to draw attention to one answer that was given by Mr. Kidd. The question was put by the Chairman: "And a scheme which might very well be a complete success if the dredger worked to expectations, might be a disastrous failure if she gave an output such as that of the 'Kalu' and 'Jinga'?—(A.) Clearly. May I just mention one very important thought which is passing through my mind which is very well illustrated by the case of these two vessels and the figures you have just given. It is a question of the men who are working. It may be much more a question of the men who are working the machine than of the machine itself"?

A.—Yes.

Q.—That puts your own view in a nutshell?

A.—That puts my view in a nutshell.

Sir Frederick Hopkinson.—And the men controlling those who are working?

A.—The men controlling those who are working, obviously.

Sir H. Courthope-Munroe.—I think I can skip the next nine pages. The next reference I have is at page 19. What do you want to say about that?

A.—I agree with Mr. Kidd.

Q.—That is again a reference to the borings?

A.—That is a reference to the borings, and I agree with Mr. Kidd.

Q.—On page 19 this question is put by Sir M. Visvesvaraya : " Do you think that any changes have occurred in the bed of the harbour since the borings were taken in 1912?" and the answer is : " It is extremely improbable." Of course those are the borings upon which you were relying. " (Q.) Do you think that dependence could be placed on the surveys in 1912 in designing in 1919?—(A.) Surely. (Q.) You do not think there would be any deposits or erosion of the bed likely?—(A.) The only thing that might have happened in the interval would be a further accumulation of soft mud. Bombay Harbour is gradually shoaling, becoming shallower."

A.—Yes, I subscribe to that.

Q.—Then he goes on to deal with the question of the shifts. There is nothing more to which you desire to draw attention, is there. Can we pass to page 23?

A.—Yes.

Q.—Here, I think, you want to draw attention to the answer given by Mr. Kidd in connection with the matter of the bonus?

A.—That is the point. I have already stated it in my evidence, but I would like to emphasise what Mr. Kidd says : " But I have sometimes wondered whether the magical effect of a bonus would not have procured very much better results." Then he says that he took a Port Trust dredger on hire, and that he got outputs far exceeding the best which had ever been obtained by the Port Trust, and he attributed it solely to the fact that the boat crews had a bonus on results.

Q.—He says : " Yes, and I attribute those better results solely to the fact that I paid the crew a bonus on results."

Sir Frederick Hopkinson.—A bonus is paid for getting something above the normal?

A.—Yes.

Sir H. Courthope-Munroe.—It used to be.

Sir Frederick Hopkinson.—It should be paid for nothing else.

Sir H. Courthope-Munroe.—We may be living in different days now.

Witness.—With a bonus the men are always hoping to get something beyond the normal, and they get up to the normal.

Sir Frederick Hopkinson.—They are paid to do the normal.

Sir H. Courthope-Munroe.—Is there anything on page 26?

A.—No, there is nothing there.

Q.—I think you have dealt with that question, and I will leave it?

A.—I have dealt with that question. At the top of page 26 Mr. Kidd says : " I have always been amazed at the simple fact that Sir George Buchanan's original estimate after the war was a lesser figure, or an approximate figure to mine made in 1912. That has always been an incredible fact to me." I have explained that, and I adhere to it.

Q.—I think the Committee are in possession of your views upon that. Now we go to the evidence of Mr. McMurray at page 31. Do you want to refer to page 26 at all? I have nothing marked on that?

A.—No, I think that is all.

Q.—On page 29 you are dealing with Mr. McMurray's evidence, and your comment is : " It has been established, I think, that on their trials in Bombay these dredgers did 37½ per cent. above their guaranteed delivery."

A.—I have already spoken upon that subject.

Q.—I thought that that was what you wanted to refer to?

A.—Yes, but you understand that so much has happened since this compilation was made.

Q.—I thought that that was one of the pages that you marked?

A.—Yes.

Q.—You draw attention to page 31. What is it that you want to say with regard to that?

A.—Mr. Kidd emphasises, as it is recorded, that when he put the " Jinga " on to the blue clay she gave much better results than when she was dredging mud alone.

Sir Frederick Hopkinson.—I do not think we have any evidence at all that Mr. Kidd ever did any dredging there?

A.—He said that he persuaded Mr. Messent to do it, and he pointed to the figures which he marked in green as showing the better output when the " Jinga " was working in blue clay. Then Mr. McMurray remarks : " I cannot accept anything of the kind."

Sir H. Courthope-Munroe.—What is the next matter to which you desire to call attention? I have nothing marked in the next few pages.

A.—I have got to Mr. Lewis's evidence now, at page 42.

Q.—I have something marked on page 41. The question was put by Sir M. Visvesvaraya to Mr. McMurray, that the actual test with the dredger on the Clyde was farcical. What do you say to that?

A.—I have already said all that I can say. I was not present at the tests.

Q.—You did not superintend the tests. That was done by the naval architect in England?

A.—By the naval architect, and my partner was there, but I have said all that I can usefully say upon that.

Q.—If you were not there, that is a matter which more concerns him than you?

A.—Yes.

Sir M. Visvesvaraya.—Was it not necessary under the contract that you should pass the dredger? Was it not necessary that the dredger should be tested by Messrs. Meik & Buchanan according to the terms of the contract?

A.—Mr. Meik was present at the trial.

Q.—Mr. Meik was there?

A.—Yes, he was present at the tests.

Q.—At all the tests?

A.—At all the tests of both dredgers? I was in India.

Chairman.—He sets out the records at page 31 of this big book of correspondence.

Sir H. Courthope-Munroe.—At page 45 the question crops up again of beginning both ends of the wall at once, but you have dealt with that?

A.—I have got to page 54, and I cannot find anything to which I want to refer.

Q.—Do you want to say anything with regard to page 54?

A.—No, I have nothing to say as regards page 54. At page 55 Sir Frederick Hopkinson asks Mr. Lewis: "Had Sir George Buchanan a clearly defined scheme for doing every detail of this work? Did he tell you that he wanted a gantry here and he wanted to use so many trucks there, and locomotives here, and so on?" I say no, I was not carrying out the work; that was left to the Director of Development and to his chief engineer.

Q.—On page 58 there are two matters that you wish to clear up. I see that Sir Frederick Hopkinson, in asking some questions of Lord Lloyd, by error, no doubt, assumed that you had said certain things. At page 58 the question is put by Sir Frederick Hopkinson: "He (the Secretary) was casting doubt as to whether it was wise to do this reclamation by means of dredging, because the experience of the employment of suction dredgers on a large scale with limited and reclamations in a large scale were limited." That is the context. Then Sir George Buchanan rebuts that by saying: "I am therefore to point out that the large reclamations being carried out by the Port Trust afford exceptionally complete data for estimating work of this kind." I think, in point of fact, you never said anything of the kind?

A.—No.

Chairman.—That is a quotation from a letter.

A.—That is a quotation from a letter.

Sir H. Courthope-Munroe.—As it appears there it looks as though Sir George Buchanan had said it. It is quite clear that he did not say that.

Chairman.—I do not think it was Sir Frederick Hopkinson who asked the question. I think I put the question, and I have corrected it in the proof, because I realised that it was not right; it will be corrected.

Sir H. Courthope-Munroe.—On my notes it appears in that way.

Chairman.—I have got that in mind. I think it was I who put the question.

The Witness.—You have dealt with Lord Lloyd's evidence.

Sir H. Courthope-Munroe.—Yes. I am not going to touch upon that, because I have dealt with that fully. As I said on Saturday, I think you agree with every word of Lord Lloyd's evidence?

A.—Yes.

Q.—You are not in conflict with any of it. I think there is nothing that you want to say about Lord Lloyd's evidence beyond what I have already said?

A.—No, nothing.

Q.—I think that concludes your comment, in substance, on the London evidence, does it not?

A.—Yes.

Sir H. Courthope-Munroe.—I hope the Committee will not think that I have been too long in dealing with that?

Chairman.—No.

Sir H. Courthope-Munroe.—There remains only a few general matters to clear up.

Chairman.—There is one question I should like you to ask Sir George Buchanan on Mr. McMurray's evidence. Mr. McMurray made a very strange statement: That he had told Sir George Buchanan that whilst he was only giving him a soft clay dredger he must recognise that the dredger would work much more slowly in any other substance than soft clay. I should like to know if Sir George Buchanan remembers any conversation of that kind with Mr. McMurray.

Sir H. Courthope-Munroe.—Will you deal with that now?

Chairman.—He said it took place at Renfrew

A.—I think I stated in my evidence that when I was at Renfrew I had an interview with the firm. We discussed it with Colonel Brown, who is now dead.

Q.—That is quite right.

A.—Yes. Colonel Brown realised I had stated the material as clay and asked what I meant. Then we said it was the same material as the "Jinga" and "Kalu" had done, and we agreed that soft clay, which was the designation used for the material for the "Jinga" and the "Kalu," was the medium. Whether it was said or not, naturally anybody knows that if the dredger dealt with anything much harder than soft clay the output would probably be reduced.

Q.—Mr. McMurray in his evidence has made it clear to us that the reason why the firm would not give a test on site was because he knew that he would come up against material in the harbour that could not be described as soft clay. That he was concealing from you knowledge that he had in his head, if he was telling us the truth?

A.—There was no conversation on those lines with him. If he thought there was very much harder stuff in the harbour he certainly did not tell me so.

Q.—Yes. In answer to Sir M. Visvesvaraya he said definitely and plainly that the reason why he would not agree to a test was because he knew there would be hard stuff in the harbour, and he pledged himself to it all the way through, that they had given this soft clay description as regards the dredger obviously to limit their liability. Sir Frederick Hopkinson put to him whether he was not tricking you in relation to it.

A.—He certainly never gave me any suggestion of that kind.

Q.—He never gave you any hint that you might come up against hard material?

A.—He never gave me any hint in that respect.

Sir Frederick Hopkinson.—He claimed to have a thorough knowledge of all the clay in Bombay Harbour?

A.—So did Mr. Kidd. They were both out there when the "Jinga" and the "Kalu" were working. I understand that when they were working at Sewri there were a number of stones which had been deposited in connection with some quarrying operations. They were not part of the original soil, but a number of large stones had got on to the ground, and that gave a good deal of trouble to the dredgers; whether Mr. McMurray was guarding himself against anything of that kind I do not know.

Sir Frederick Hopkinson.—No.

The Chairman.—He did mention that it was the hardness of the material, the moorum and rock.

Sir Frederick Hopkinson.—And the clay.

Chairman.—And the clay. He may not have been playing very, very candidly with you either just before the 25th of July, or on the 29th of August, but that is how the matter seems to stand on the evidence?

A.—Yes.

Sir H. Courthope-Munroe.—I have not seen that part of the evidence to which the learned Chairman has referred, but I notice that in your letter which I read this morning, dated the 25th of August, 1919, when you opened the ball and asked Messrs. Simons for their estimate for this dredger you stated: "I shall be satisfied with a test in this country and your guarantee that the plant will do the work required"?

A.—Yes.

Q.—Rightly or wrongly, from your point of view, you never anticipated a trial elsewhere than in England?

A.—No, I did not.

Q.—It follows.

A.—Yes.

Sir Frederick Hopkinson.—That was never incorporated in the contract.

Sir H. Courthope-Munroe.—Yes. This is the letter that opened the ball.

Chairman.—No. What opened the ball, as you can see from that letter, was an antecedent interview with Mr. McMurray, because you will see that that letter says: "' He and I are in general agreement about the nature of the plant required.'"

Witness.—That is correct.

Q.—That is what happened, and then the suggestion that there should be a trial at Bombay was turned down?

A.—Yes.

Q.—Then in the latter dated the 25th of July, 1919, you say: "I am willing to have a trial on the Clyde, and then I want a guarantee that the plant will do the work required." Mr. McMurray never gave a guarantee, nor did Messrs. Simons, that the plant would do the work required. They are too canny. They never gave that guarantee. They were giving no guarantee as to performance in Bombay. Mr. McMurray was quite definite about that.

A.—Yes.

Sir H. Courthope-Munroe.—In point of fact, the test did take place, I understand, on the Clyde.

Chairman.—Yes, that is right.

Sir H. Courthope-Munroe.—Does that conclude your question?

Chairman.—Yes.

Sir H. Courthope-Munroe.—(To the Witness.) I think there are only one or two general matters left now. This is not, as we know, the first big job that you have undertaken.

A.—No.

Q.—You have a job, I think, in Scotand now that is even bigger than this?

A.—We have a very large work in Scotland at the present time.

Q.—Is this the first time that it has been suggested that your work has turned out a failure?

A.—Absolutely—it is unique.

Q.—Has all your work, with one exception, been on the lines that I indicated to the Chairman as being the usual lines for foreign work, where the Resident Engineer has been your servant and your representative?

A.—No.

Q.—I think there is one case.

A.—No. There was one case where the Resident Engineer was appointed on similar lines to Mr. Lewis, and the work was a complete success; we had no trouble.

Q.—I think there is only one case where you have done work for a Government more or less on these lines?

A.—We have done one work for a Government on these lines, and we were fortunate in having no Development Directorate to deal with, and the work was an absolute success, and we were congratulated upon it. We have been doing another work exactly on these lines for a large private company in Italy, and there also the work was carried out to a complete success. We have two examples within my knowledge of works carried out on similar lines, but they were a success, and if we had suggested for a moment that our Resident Engineer ought to have gone he would have gone within twenty-four hours.

Q.—With those two exceptions, your work has been on the general lines of the Resident Engineer being your servant, payable and dismissible by you, and, as I say, your eyes abroad?

A.—Yes, and the work has been done by contract.

Q.—You have told us all about Mr. Lewis. There is one other matter only that you have noted here. Sir Frederick Hopkinson, I think, rather pressed the point that in this work you ought to have had what I think he described as a double stage pump?

A.—That was in the statements; I have dealt with that.

Q.—There are two sides to that question?

A.—My reply really is that the question is one which ought to have been dealt with by the Naval Architect, Sir John Biles. It was a technical matter. I am not an expert in pumps. I tell you that at once, and I think that Sir John Biles might reasonably have been asked that question.

Q.—Sir Frederick Hopkinson has put one side of that, but there is another side to it, is there not?

A.—I would rather leave it.

Q.—You have dealt with the question of your estimates, and I think you have expressed your regret that this Committee has not got a few Westminster engineers on it, as well as the present personnel. You are quite willing to hand over these estimates to any two or three Westminster engineers for them to say whether they were in the ordinary form or not?

A.—Certainly. I will welcome any investigation by a tribunal of Westminster engineers.

Q.—Is there anything that you have mentioned to me to which you wanted to refer? There is one little matter in Mr. Settle's Report. We took Mr. Settle's evidence at the end of the day, and his Report was put in, but I do not think very many questions were asked upon it. Is there anything on which you want to lay stress, and direct to the attention of the Committee upon that Report?

A.—I would like to stress the point that Mr. Elgee, in his evidence, I think, said that Mr. Settle had been there for only three or four days. As a matter of fact he was there for four weeks. He went out when I was very ill to do anything he could to help in this matter. I should have been there except for illness, and he was there for four weeks, not two or three days, and he reported to us. He made numerous suggestions, but I doubt very much whether any of them was given effect to.

Q.—Is there anything in the Report to which you want to call the attention of the Committee?

A.—He told them very definitely that they ought to devote less time to work unconnected with the dredging, and concentrate on the dredging. He showed them how to dredge. What I would really like to emphasise is that in my absence we did everything that we possibly could to help matters. We sent out Mr. Settle at our own expense. We were prepared afterwards that Mr. Halcrow himself should go out. We did all that human beings can do to get a move on when we found the way in which things were going.

Q.—Have we come to an end of this, or is there anything else?

A.—I should like to make one remark about which there has been some misunderstanding. Sir Frederick Hopkinson, at the close of the last hearing, asked whether I considered, putting it in bald language, we had earned our fees, or words to that effect.

Sir Frederick Hopkinson.—I do not think that is a fair way of representing anything that I said?

A.—I do not want to represent anything unfairly. That is my bald way of putting it. What I am going to say is that I think Sir Frederick Hopkinson knows that our fees for actual work done have been less than those usually charged by Westminster Engineers.

Q.—I am not prepared to agree to that.

A.—And considerably less than the Colonial Office pays for similar work. Those are matters that can be proved.

Sir H. Courthope-Munroe.—I do not think that it is a matter we need pursue very much.

A.—No. I merely wanted to point that out.

Q.—I suppose that the reason why they are less, as you say, is on account of the magnitude of the job?

A.—It is a matter of comparison; they are less.

Q.—Is there anything else?

A.—I should like to go on with that. I say that I carried out my bargain to the fullest extent. I let pass other equally remunerative work, and, so far as money goes, I should actually have been just as well off if there had not been any Back Bay Reclamation Scheme. It was not a money-making concern, particularly to me. It was a large work in which I was interested.

Q.—As far as money goes, you would have been better without it, and as far as vexation, trouble, and worry go, you would have been well quit of the whole thing?

A.—Absolutely.

Q.—Is that all?

A.—That is all. Sir M. Visvesvaraya was asking me about moorum, and I said before lunch that I would give him an extract from a letter from Mr. Lewis on the subject of moorum filling. I will read it, and then I will put it in with the other documents. It is dated the 14th of May, 1921: "I wonder whether you have ever considered the question of the moorum topping to the reclamation? I have just taken out a few figures. The amount of stuff to be shifted is approximately 100 millions of cubic feet, with trucks taking 400 feet, this means 250,000 trucks. 5,000 trains of fifty trucks each, and at two trains a day, would require 2,500 days, or some eight years. If the work is to be done in two years then we shall have 600 days to work in, and shall require 8·3 trains per day. The B.B. and C.I. what with their quadrupling, the rebuilding of Grant Road Terminal Station, and the electrification of the line, will probably be in a state of chaos for ten years to come, and will never be able to handle that amount of traffic. The problem is will the moorum be necessary, and, if so, will it be possible to get the amount of material and transport it in the requisite time?" Then we come on to Sir Lawless Hepper's idea of an underground railway.

Sir Frederick Hopkinson.—That deals only with moorum topping, not moorum filling.

A.—That is so, but what I want to point out is that if there is all this tremendous question with reference to moorum topping——

Chairman.—One foot of moorum.

A.—If there is all this tremendous question about one foot of moorum, what about your colleague's desire to fill up the whole area with moorum?

Sir Frederick Hopkinson.—He prejudices at once the statement that he makes by saying that the B.B. & C.I. will be in a state of chaos for 10 years. This is in 1921.

Sir M. Visvesvaraya.—Things are quite different now.

A.—Yes.

Sir Frederick Hopkinson.—He is prejudicing the statement that he makes.

Sir H. Courthope-Munroe.—Does that conclude the matter, or have you anything else on your notes to which you wish to refer?

A.—No, I have nothing more to say at all.

Sir H. Courthope-Munroe.—That concludes all that I want to ask Sir George Buchanan. Before the Committee terminates this Inquiry, so far as the hearing of the evidence is concerned, Sir George Buchanan wishes me, on his behalf, to thank you for the full and patient hearing that you have accorded to him. He wants me also to remind the Committee of the terrible strain and anxiety imposed upon him by this Inquiry, which is unique in his experience, should he have, in the course of the Inquiry, appeared to resent some of the questions that duty has compelled the Committee to put to him.

Chairman.—No, it is quite the contrary. I am sure that we are all agreed that no one could have been in the witness-box for such a length of time as Sir George Buchanan has been, and have comported himself more charmingly and exactly in every possible way.

Witness.—I thank you.

Chairman.—It is only fair to say that.

Sir Frederick Hopkinson.—I entirely agree.

Chairman.—We are all agreed about that.

Sir M. Visvesvaraya.—We are all agreed about that.

Chairman.—We are very much obliged to you, Sir George. We realise that it has made a tremendous demand upon your time, and we do appreciate very much the manner in which you have dealt with every matter that we have put before you.

Witness.—I am very glad indeed if I have been of any assistance, and I say again what my Counsel has said, that I very much appreciate the courtesy shown to me by you, Mr. Chairman, and by your colleagues.

Chairman.—We are much obliged to you also, Sir Harry.

(*The Witness withdrew.*)

APPENDICES TO THE EVIDENCE RECORDED IN ENGLAND.

(I.)

Questions formulated by Committee and publicly announced at first sitting in Bombay on 3rd August, 1926, and referred to by witnesses in India and England.

The following are the subsidiary questions in so far as we have at present been able to formulate them :—

1. Before the decision to undertake the scheme was arrived at, was it fully explained by the Government of Bombay to the Government of India and the Secretary of State in Council, and was it embarked upon with their approval and sanction?

2. Before deciding to undertake the scheme did the Government of Bombay have any, and what, correspondence or consultations with the Port Trust and/or the Royal Indian Marine and any or what other public body, syndicate or persons in relation to :—(*a*) the feasibility of the scheme, (*b*) their experience of dredging operations in the harbour, (*c*) the nature of the sea bed, (*d*) the proposal of Sir George Buchanan to dredge in the area subject to their jurisdiction?

3. Did the Government of Bombay communicate to the Port Trust and/or the Royal Indian Marine (i) the report of Mr. Kidd, "Project of 1912," (ii) Sir George Buchanan's Report of September 1919, (iii) any other and what documents, and seek advice, opinion or information from them or either of them?

4. If so, did they or either of them raise any and what objection to the site of the proposed dredging operations?

5. At what date did the Government of Bombay and/or the Development Directorate learn that the Port Trust and/or the Royal Indian Marine objected to dredging in the harbour? Were the said objections verbal or in writing? To whom were they made and what were the reasons alleged?

6. Did the Government of Bombay and/or the Development Directorate accept the objections as well founded? Were the undertakers of the scheme thus deprived of a dredging area calculated to yield 15½ million cubic yards, or some other and what estimated amount? Was this part of the area over which Mr. Kidd had made some and what number of the 1,314 borings? Was this area stated to contain material eminently suitable for dredging?

7. Did the Government of Bombay and/or the Development Directorate and/or Sir George Buchanan decide to dredge material from some other and what area? On what date and by whom was this decision made?

8. Before commencing dredging upon the new area were the Development Directorate and/or Sir George Buchanan satisfied by any and what surveys, borings or tests that as to quality and extent of material the new area was suitable for dredging?

9. Was it in fact suitable for dredging? What were the results obtained in the dredging operations in this new area, season by season? What (if any) was the additional cost? To what extent (if at all) was the work thereby delayed?

10. What were the functions of the Development Directorate in relation to the Reclamation Scheme?

11. Had any, and which members thereof, previous practical experience of reclamation upon an open sea front, or any practical experience analogous thereto?

12. Did the personnel of the Development Directorate carry out their duties efficiently?

13. In the circumstances of unsettled financial, trade and labour conditions as they existed in 1919 and 1920, would it have been practicable to carry out the work through independent contractors, or was it a wise decision on the part of the Government of Bombay to carry it out departmentally?

14. Was the urgency of the scheme so great that, notwithstanding the aforesaid unsettled conditions, it was prudent and reasonable to undertake it in 1920?

15. Was Sir George Buchanan's estimate of time and cost based upon a dredger working 15 hours a day and delivering each hour 2,000 cubic yards of dredged filling to the site to be reclaimed?

16. Was it practicable to work a dredger for such a length of time each day? If so was it, in fact, done, and throughout what period? If the dredger did not work for 15 hours a day why did it not do so?

17. Were the specifications and designs of Sir George Buchanan for the dredger *Sir George Lloyd* (hereinafter called the dredger) and the *Colaba* fit and proper for the intended work?

18. Did the makers guarantee that the dredger would discharge 2,000 cubic yards of soft clay per hour through a floating pipe line to a distance of 5,000 feet?

19. Did the dredger before delivery under proper test conditions in fact give the guaranteed output?

20. Was the dredger and the *Colaba* when delivered, in all respects in accordance with the contract? If not, in what respect or respects did one or other or both fail to conform thereto?

21. For how many days did the dredger work, and for how many hours of each day in the seasons of :—(I) 1923-24, (II) 1924-25, (III) 1925-26?

22. What was the amount of material dredged from the sea bed and the amount deposited and retained throughout each of the periods respectively? How does it compare with the estimate of Sir George Buchanan of 30,000 cubic yards per working day delivered on the reclamation site?

23. As regards the dredger *Kalu*, when did she commence work? What was her guaranteed output? Did she give the said output? What was her actual output for each and every day she worked?

24. Did any and what estimated amount of dredged filling escape through the rubble wall?

25. If any did so escape, was that in consequence of any defect in the original design of the said wall, or because of some and what departure from the original specification, or some other and what cause?

26. Were the operations carried out by those in charge of the dredgers and pumping station with all reasonable skill and diligence?

27. If the amount of dredged filling is found to have fallen below the estimate of deposit, to what is this deficiency due?

28. If we decide to recommend that the work should be continued wholly or in part, should it be carried out by (i) the Development Directorate, (ii) the Public Works Department, (iii) independent contractors, (iv) or some other and what agency?

29. Should any future reclamation be effected by (*a*) dredged filling, (*b*) dry filling, (*c*) or a combination of the two?

30. What could be the probable cost occasioned and length of time required to complete Block 8? Is its completion in the circumstances a reasonable business proposition?

31. What would be the probable cost occasioned and length of time required to complete Blocks 1 and 2? Is the completion of these in the circumstances a reasonable business proposition?

32. If we decide to recommend that the work should proceed on one or more of the said blocks, should a recommendation be also made (i) to continue the filling in of Blocks 3, 4, 5, 6, 7, or some and which of them? (ii) Or should the scheme be abandoned as far as they are concerned? (iii) Should the question of continuing the reclamation of some or all of the blocks 3, 4, 5, 6 and 7 be suspended until the financial results of any reclaimed blocks are known or can be estimated with fair certainty?

33. When and under what circumstances was the original estimate of 367·61 lakhs increased to 702·43 lakhs; and the eventual cost now estimated at 1,101 lakhs? What are the figures which make up the two latter amounts?

34. Who decided upon the system of building the reclamation wall and the quantity required for it?

35. Was this a proper and economical system or could a better one have been devised?

36. Why were the 20-tons blocks shown on the 1919 scheme abandoned and when and by whom was it decided to abandon their use?

37. Generally, if the work has not been carried out in accordance with Sir George Buchanan's estimate, can it be said how and in what manner the failure has arisen, and to whom it is attributable?

(II.)

Letter from Sir J. Biles of 8th October, 1926.

SIR,

With reference to the request made by Sir Fredrick Hopkinson as to the changes in costs of production in ships during the periods ranging from 1920 to the present time, I have to state that as far as I am able to determine :—

The maximum cost of ship materials occurred in the third quarter of 1920. By the beginning of 1923 these materials had fallen to about what they were during the last two years of the War, which latter were about 55 per cent. above pre-War prices.

As regards labour, the cost did not fall in 1921, as there was a good deal of work being completed which had been begun in the periods before 1920.

In August, 1923, the total prices of ships were about 55 per cent. of those for ships building between 1919 and 1921.

We may take it that ships cost in 1920 three times pre-War prices and in 1921, 3¾ times, while in 1923 they were costing about twice as much.

Vessels are being placed now for about 60 per cent. above pre-War.

With reference to the cutter of the " Sir George Lloyd " and the possibility of increasing its revolutions above those obtained with 150 horse-power, I have to suggest that the following should be considered :—

(*a*) The engine should be run at as high a mean pressure as the steam will carry, thereby obtaining as many revolutions as is practicable in cutting the particular clay that is being cut.

(*b*) If it is found that the rate of cutting is not thereby increased, it would be practicable by altering the train of wheels in the cutter to lower the revolutions and get a more powerful cut on the clay. These reduced revolutions with the more powerful cut might increase the total output.

(*c*) If neither (*a*) nor (*b*) produces the desired improvements, a smaller cutter could be made.

Any result produced in this direction must depend on the hardness of the clay, which can only be determined by cutting it with the existing or modified cutter under the suggested conditions.

It is to be remarked that as already stated in my evidence while making the cutter more suitable for cutting hard clay it may be made less suitable for cutting the soft clay (and mud) for which it was originally intended, and while the output in hard clay may be improved, the total output in all materials might not be.

With reference to the point that Sir Fredrick Hopkinson tried to make, viz., that if the actual velocity of the water in the pipes was only 12 ft. per second instead of 14·1 to 14·8 as demonstrated from the actual pressures in the pump, it would be interesting to know under what conditions this velocity of 12 ft. was measured and what was the actual pressure in the pump at the time, and the lengths of the pipe line.

Yours faithfully,

(Sgd.) J. H. BILES.

(III.)

Letter, dated 25th July, 1919, from Sir George C. Buchanan to Messrs. William Simons & Co.

DEAR SIRS,

I have been asked by the Government of Bombay to report on the proposed Back Bay Reclamation scheme and I shall be much obliged if you will give me an estimate accompanied by a plan for the dredging plant required.

2. I have already had the advantage of discussing the matter with Mr. McMurray and I think we are in general agreement as to the type of plant necessary.

3. The enclosed plans show broadly what is required. It is proposed to build a wall enclosing an area of some 1,200 acres in Back Bay and to reclaim the land by dredging in Bombay Harbour and pumping the dredged material through pipe lines across the Colaba Peninsula.

4. The main points for consideration are :—

(*a*) The number and size of pipe lines necessary.

(*b*) The position of the relay pumping station or stations.

(*c*) The capacity and type of the dredger employed.

5. The following are my views on the subject :—

(1) A project prepared by a firm of Contractors in 1912 proposed seven pipe lines across the peninsula but I am disposed to think such a large number are unnecessary and will add considerably to the difficulties and cost of the work as the pipe lines have to be laid underneath existing streets. I therefore propose three pipe lines, Nos. 6, 4, and 2 on the plan, with auxiliary lines laterally and outward as necessary.

(2) The length of the pipe line from dredger to relay pumping station should be the greatest that a dredger with one pump can work successfully and must not in any case be less than 5,000 feet; the sections accompanying this letter give the levels throughout the three pipe lines.

It is matter for consideration whether the relay pumping station should be established afloat on a barge or on the land but in either case it would probably be cheaper to drive the pump by electricity.

(3) The dredger must work to a depth of 70 feet and have a *minimum capacity of* 2,000 *cubic yards* of clay per hour discharged at the extreme end of the whole pipe line.

I consider the type of dredger most suitable would be that of the " Jinga " or " Kalu " with all recent improvements and modifications. Arrangements must be made to raise steam in the boiler by either oil or coal fuel and I shall be obliged by your opinion on the use of the Diesel or similar type of internal-combustion engine or alternatively driving the pump by electricity supplied from Bombay Central Station.

These were proposals of the contractors already alluded to but do not commend themselves to my judgment.

6. An estimate is required of the cost of the plant complete, delivered and erected at Bombay, and as in the case of the dredger " Pelican " you built to my order I shall be satisfied with a test in this country and your guarantee that the plant will do the work required. Time is of importance and I should like to know the earliest date delivery could be given from the placing of the order.

7. The Contractors offered to procure for Government the plant at " the special prices at which manufacturers supply plant and materials to contractors." I was not aware that a Government dealing direct were not in as good a position as contractors and shall be glad of your observation on this point.

8. The proposals I have outlined above are subject to modification if your experience can suggest improvement and I should like to meet you at Renfrew and discuss details personally at a later date when you are ready for me to do so.

I am,

Yours faithfully,

(Sgd.) GEO. C. BUCHANAN.

(IV.)

83, Victoria Street,
Westminster,
London, S.W.

9th October, 1926.

R. B. EWBANK, Esq., C.I.E.,
6, Richmond Terrace,
Whitehall, S.W.1.

Dear Sir,

I have to acknowledge the receipt of your letter of the 6th inst., and in reply would say I have had a careful search made and cannot find any written record that Sir George Buchanan asked Messrs. Simons to agree to a test of the dredger in Bombay.

With regard to the question of the capacity of the pumps on the " Sir George Lloyd " when delivering water, the capacity is approximately sixty thousand gallons per minute and will vary according to the condition of the pipe line, etc.

Yours faithfully,

(Sgd.) THOS. McMURRAY.

(V.)

Extract from letter of 23rd April, 1925, to the Chief Engineer, Reclamations Branch, Development Directorate.

Through the Director of Development.

* * * * * *

As it is not important that the finished bottom of the dredging should be level, the bottom 2 or 3 ft. of stiff clay with murum and boulders should, if possible, be avoided wherever met with as it is apparently unsuitable and uneconomical for the dredger to deal with.

* * * * * *

23rd July, 1925.

Sir LAWLESS HEPPER, Kt.
Director of Development,
Reclamations Branch,
Old Custom House Yard, Fort,
Bombay.

Dear Sir,

Back Bay Reclamation.

Further to our letter of 25th May last, we have had several conversations with the Deputy Chief Engineer Dredging (Mr. C. R. Brims) since his return to this country.

We gather that there is nothing wrong with the dredging plant and, therefore, no complaint can be made against the builders.

The opinion we have formed as a result of the conversations is that, as previously suggested by us, an incentive should be given to the men working the dredgers in the form of bonus on output and, further, that every effort should be made not to lose time working in hard material if softer is available in ample quantities as we consider increased speed of working more important than quality of material.

Yours faithfully,

C. S. MEIK & BUCHANAN.

15th October, 1925.

THE SECRETARY TO THE GOVERNMENT OF BOMBAY,

Development Department,
Bombay Castle,
Bombay.

SIR,

Bombay Back Bay Reclamation Scheme.

In continuation of our letter, dated 24th September, acknowledging receipt of your letter S.B. 1291, of 28th August, on the subject of dredging operations, Sir George Buchanan has returned to London and we have discussed the matter fully with him and Mr. MacMurray, the London representative of Messrs. Wm. Simons and Company, Limited, who were the builders of the dredging plant.

2. The following are some of the conclusions arrived at :—

(I) The dredger " Sir George Lloyd " was designed to dredge 2,000 cubic yards of soft clay and silt per hour and pump this quantity on shore through a pipe line 5,000 feet in length and there seems to be no reason for assuming that this work cannot be performed. All her tests on the Clyde were carried out to the complete satisfaction of the consulting naval architects, Messrs. Sir John H. Biles and Company, and, from the time that the vessel was taken over by the Government of Bombay, the builder's responsibility ceased.

(II) The builders are naturally for their own sakes anxious that the plant should prove a success, but they are not specialists in the handling and working of dredging plant and in the absence of any specific complaint about the machinery or any portion of same, it is not clear what good interest could be served by their representative going to Bombay. Nevertheless if it can be shown that a visit would be advantageous they are only too anxious to do what is possible in the matter.

(III) The lowness of the output of the " Sir George Lloyd " is in our considered opinion due to one of two causes, or probably a combination of the two :—

(*a*) Unsuitable material, and
(*b*) inefficient handling of the plant.

It is obvious that if the dredger is put to work in such hard material that the cutter blades are damaged, as we understand was the case last season, or if the dredger with booster is asked to deliver continuously through a length of pipe line largely in excess of 10,000 feet, the output must be greatly reduced. We are therefore of opinion (and so informed Mr. Brims when he was here) that when the dredger is found to be working in this hard material, the suction pipe should be lifted and operations continued in the softer clay overlying the rock.

Regarding the handling of the plant, we suggested in our letter, dated 25th May, 1925, that on work of this description it is of vital importance to give an incentive to the men employed ; we can only repeat and emphasise this statement and would observe that no contractor would for one moment have handled the job in the way in which it is being carried out in Bombay. In this connection we would invite a reference to paragraph 29 of Sir George Buchanan's report dated 11th February, 1922, which reads as follows :—

> " In carrying out a large public work departmentally success both economic and technical depends to a large extent upon the adequacy, efficiency and loyalty of the engineering staff, technically because apart from actual design much depends upon workmanship and economics because the spending of money and the employment to the best advantage of workmen is entirely in their hands.
>
> " Government is in regard to its staff at a disadvantage compared with a contractor or a private firm. The loyalty and enthusiasm of a staff is often taken for granted but it is rarely spontaneous and in the case of a contractor or private firm bonuses are given for particularly good work and in other ways officers are encouraged to do a great deal more than is strictly required of them, also on the converse side if an engineer is inefficient a contractor will cut his losses and get rid of a man by paying whatever is legally due in lieu of notice. Government rules precludes either bonuses or pay in lieu of notice and I merely mention this matter because it is one of the chief advantages gained in employing a contractor for the execution of public works."

(IV) If the difficulties in connection with (*a*) and (*b*) supra can be overcome we are absolutely confident that there will be an enormous increase in the output this season and in that case a final judgment on the ultimate cost of reclamation by dredging might we suggest be deferred.

3. According to the figures given in your letter under reply, 1,261,986 cubic yards of material was dredged from the harbour during the last season but only 680,438 cubic yards was deposited in Back Bay. The smallness of this latter figure obviously points to a great leakage from the area under reclamation and the advisability is indicated of tipping a watertight moorum bank along the inside face of the sea wall and otherwise arranging for the detention within the area under reclamation, of as much as possible of the silt-laden water discharged through the pipe line until the silt has precipitated. Under these circumstances, we disagree with the view taken that the quantity of filling as measured in the area to be reclaimed should be taken as the basis of calculating the output of the dredger. In all normal cases the quantity of filling is slightly greater than the quantity of material dredged as measured by soundings and, assuming that the chief engineer's figures given in your letter are correct, we consider that the loss of material in the reclaimed area is quite as serious a matter as the low rate of output of the dredger.

4. Respecting the quality of the material being dredged in the harbour, this is a question which, as you are aware, has been the subject of investigation, discussion and report by Sir George Buchanan ever since the inception of the work, because, as he has repeatedly stated in his reports, the crux of the whole undertaking is the successful reclamation of the area enclosed by the wall by pumping through pipe lines the material dredged from the sea bed, and in his last annual report, dated 15th December, 1924, he reviewed exhaustively the position in respect to dredging plant and dredging operations. It follows, therefore, that if as a result of this season's work it is found beyond doubt that there is not sufficient suitable material in the harbour for the economic reclamation of Back Bay by dredging it will be necessary to reconsider and modify the programme of operations although we sincerely hope that such will not be necessary.

5. In your letter you observe that Government undertook the reclamation on the recommendation of Sir George Buchanan contained in his report of September, 1919, the essential feature of the proposals being the capacity of the dredger to reclaim the area at the rate of 2,000 cubic yards per hour. In this connection we beg to repeat that we have no doubt at all as to the capacity of the dredger to perform the work given suitable material, and we would point out that in recommending the work Sir George Buchanan relied entirely on the detailed survey and report of Mr. Kidd, who said it had been completely established that there was available more than three times the quantity required of suitable material. On this data Sir George Buchanan remarked, *vide* paragraph 34 of his report, "on the assumption that Mr. Kidd's surveys and borings are correct, and I see no reason to doubt their accuracy as a great many borings were taken, I accept his conclusion both in respect to quality and quantity of material." Sir George Buchanan did not himself take any borings, nor in view of the urgency with which his report was required would there have been time to do so. We understand from Sir George Buchanan that Mr. Kidd's borings and estimate of quantities were also accepted as sufficiently accurate by the officials in the Public Works Department of the Government of India, when Sir George, at the request of His Excellency the Governor of Bombay, went to Delhi especially to discuss the project with the Government of India and obtain their sanction and approval to the technical details of the scheme.

6. With reference to the various letters and cables which have been exchanged between us with regard to the date of Sir George Buchanan's next visit to Bombay, we very much regret to inform you that he is at present in such a bad state of health that his doctor has stated emphatically that in his opinion it is extremely unlikely he will be able to travel to India without the most serious prejudice to his health before the autumn of 1926. We need hardly say that this is a matter of very serious concern to Sir George, who was relying on being able to fulfil his engagement, but ill-health is a matter which unfortunately cannot be guaranteed against.

7. In order to assist as much as possible your construction staff in solving the problems before them, we are sending the senior member of our staff, Mr. J. Risley Settle, M.Inst.C.E., to Bombay to enquire into matters and advise on the spot; he leaves London this week. We also hope to be able to arrange that Mr. Halcrow pays a short visit to Bombay early in January and we shall be glad to hear from you if the Government will accept these arrangements which are the best we can make, in lieu of the visit of Sir George Buchanan required by our agreement. Should Sir George's recovery be more rapid than expected he will, of course, go to Bombay instead of Mr. Halcrow.

Yours faithfully,

(Sgd.) C. S. MEIK & BUCHANAN.

(VI.)

Extract from letter, dated 24th July, 1924, from Chief Engineer to Messrs. Meik & Buchanan.

(Through the Director of Development.)

DEAR SIRS,

I have to acknowledge the receipt of your telegram, dated 23rd July, which translated reads as follows :—

" Anxious about dredging have you made arrangements regarding engagement of complete staff for working double shift on all dredgers."

In reply I confirm having wired you as per copy enclosed herewith.

I now enclose for your information copies of my letters to Government asking for arrangements to be made for the engagement of staff required to complete the stablishment to work dredgers double shift, together with a copy of the reminder sent on receipt of your telegram referred to above.

* * * * * *

Yours faithfully,

(Sgd.) H. A. ELGEE,

Chief Engineer.

Enclosure.

Extract from telegram, dated 24th July, from the Chief Engineer, Reclamation to Messrs. C. S. Meik & Buchanan.

Reference your telegram 23rd July have asked Government engage necessary staff, stop.

* * * * * *

Copy of letter, No. 2710, dated 24th July, 1924, from the Chief Engineer, Back Bay Reclamation Scheme, to the Secretary to Government, Development Department.

I forward herewith a copy of telegram received from Messrs. Meik & Buchanan for information.

" Anxious about dredging have you made arrangements regarding engagement of complete staff for working double shift on all dredgers."

I would refer to my Nos. 2432 of 30th June, 1924, 2672 of 22nd July, 1924, and 2673 of 22nd July, 1924, asking for arrangements to be made for the engagement of officers to complete the staff required and would again point out the urgency of immediate action being taken if the services of these men are to be obtained in time for the commencement of the dredging season.

Copy of letter, No. 2432, dated 30th June, 1924, from the Chief Engineer, Back Bay Reclamation Scheme, to the Secretary to Government, Development Department.

The undermentioned additional staff will be required for the dredging operations next season.

Grade.	*No. required.*	*Rate of pay.*
2nd Engineer	4	640-30-700
3rd Engineer	4	540-30-600
Assistant Dredging Masters ...	2	600-50-800

These appointments bring the numbers in the respective grades up to the establishment sanctioned in G.R. No. S.C. 1735, dated 26th November, 1923.

I should be glad if Messrs. Meik & Buchanan could be asked to recommend suitable men for these appointments. The High Commissioner should be asked to engage the men recommended if found fit for service on a four years' agreement on the usual terms.

It would be convenient if it could be arranged for one 2nd Engineer and one 3rd Engineer to arrive in Bombay by the 19th September and the remainder of the men by the 26th September.

(VII.)

Wash Borings made in Back Bay.

Statement produced by Sir G. Buchanan.

AREA " A "—February to April, 1922.

63	7 3	0 — 4 0	Soft clay.
		4 0 — 7 3	Hard clay and stones.

NOTE :—The strata referred to as sand and soft clay varies from a mixture of sand and silt on the surface to a blue clay with sand which hardens on exposure.

The hard clay varies from brown to red in colour and is washed up in lumps with small edged stones (not pebbles) embedded and appears to resemble what in the dry state forms the murram in the hills around Bombay.

Beneath this there appears to be a similar soil but with larger stones not removable by wash boring.

Borings carried out during week ending Wednesday, 7th February, 1923.

AREA " A "—Point 41.

		14 0 — 17 0	Rock.

(VIII.)

Design and Alleged Porous Nature of Rubble Mound.—Note by Sir George Buchanan.

The wall was properly designed, with small material, *i.e.*, the run of the quarry in the middle, and large stones outside, and properly constructed, the wall should have blinded itself, because the silt-laden water would have filled up the small interstices and made the wall watertight.

Naturally above the filling, tidal water will flow through the wall.

If the wall was not built to plan and specification it was the fault of the engineers on the job, and particularly Mr. Elgee, who was in charge of the Marine Lines section, and Mr. Billington, at Colaba.

On my inspection I frequently pointed out that we did not want all big stones in the middle, and that what was required was the run of the quarry.

When dredging started the material was particularly good, and so far as I could see very little was being lost through the wall, and on the occasion when I was asked if certain blinding was required I pointed out I would rather have the material elsewhere, but I distinctly remember on several occasions pointing out to Mr. Billington and Mr. Lewis and, I think, to Mr. Brims; but of that I cannot be certain, that if material was escaping anywhere it was down the large storm-water drain and that this should be closed. When at a later date it was apparent to the engineers on the spot who were looking at the work all day that large quantities of material were escaping through the wall, it was their obvious duty to take action. I understand Mr. Brims, the superintendent of dredging, asked repeatedly that this should be done, but Mr. Elgee refused, and our engineer, Mr. Settle, when in Bombay in December, 1924, reported to us that even at that date no proper action had been taken.

Letter dated 24th January, 1924, from Chief Engineer to Sir G. Buchanan. (Through the Director of Development.)

DEAR SIR,

IN a discussion in Sir Lawless Hepper's room a few days ago it was suggested that the rubble mound should be lined on the inside with a layer of quarry spoil to prevent any leakage of dredged material. Would you agree to have this spoil placed in position from the present time onwards? If this can be done the disorganisation of the quarries due to the curtailment of programme will be mitigated and use can be made of a by-product which otherwise has to be found room for with some difficulty and at some expense.

I propose a thickness of 3 feet of spoil.

Yours faithfully,

(Sgd.) LL. W. LEWIS,
Chief Engineer.

Letter dated the 28th January, 1924, from Sir George Buchanan, K.C.I.E., to the Chief Engineer, Reclamation Branch.

(Through the Director of Development.)

DEAR SIR,

No. 371.

Reference your letter dated 24th January, 1924.

I AM not in favour of beginning at present the lining of the rubble mound on the inside with quarry spoil. I believe that later on when the reclamation towards the wall is more advanced, it may be desirable to put a lining on the inside up to H.W. Neap Tides only, but any small stuff deposited now would I am afraid be dispersed and washed away. In the matter of making immediate use of your quarry spoil, I consider a great deal could be utilised in the reclamation of the area between the old foreshore line and the railway embankment (*vide* my letter dated 21st January).

Cross Bunds.—With reference to my decision to delete the cross bunds from the programme, it seems to me that as the dredger "Kalu" will not work in Back Bay this season, work might very well be suspended on the cross bund now in course of erection at Marine Lines. The only object to my knowledge in making this bund was to facilitate dredging operations in the absence of the storm-water drain, but by next season when dredging begins the storm-water drain will be finished. There is, I believe, some 5,000 tons of stone still to be deposited to finish the work, so that a saving could be effected by stopping the work of, say, 30,000 rupees.

Yours faithfully,

GEO. C. BUCHANAN.

(IX.)

Alleged Inadequacy of Dredging Plant.—Statement by Sir George Buchanan, K.C.I.E., Dated 18th November, 1926.

With reference to Sir Frederick Hopkinson's question asking me how, with the plant available, I proposed to reach with the pipe lines the extreme points in the reclamation area, my explanation is as follows:—

Plans Numbers 3067 and 3068 (copies appended hereto*) were sent to the builders with full particulars of the work to be done, and they were asked, on these plans and particulars, to submit an estimate for dredging plant suitable for the work.

In the first instance, as explained to the Committee, and in accordance with the usual practice of Consulting Engineers, an estimate was obtained from Messrs. Wm. Simons & Co., Ltd. They had designed the "Jinga" and "Kalu" for work in Bombay Harbour in material similar to that for which the Back Bay dredger was required; they had also designed the dredgers for the Burma Government, used in the Twante Canal, which had worked most successfully under my supervision in Mesopotamia—and I approached them feeling that I should get a practical proposition.

Messrs. Simons & Co., submitted a tender for a dredger capable of discharging at the rate of 2,000 cubic yards of soft clay per hour through a floating pipe line to a distance of 5,000 feet; an intermediate stage pumping station capable also of delivering to a distance of 5,000 feet; 5,000 feet of floating discharge pipe, and 8,500 feet of shore piping, this latter being sufficient to cover the whole area. It was realised by me that the total distance that the material would have to be conveyed exceeded, in some cases, 10,000 feet. This aspect of the case was discussed by me with Messrs. Simons & Co., and it was agreed that an auxiliary shore booster, estimated by the firm to cost three lakhs of rupees, might be necessary, but that consideration as to its purchase might be deferred until work had actually been put in hand. It will be noted that on p. 30 of my project report of 1919, the three lakhs provision is indicated clearly in the difference in cost between the dredger and one shore delivery, and the same dredger and two shore deliveries.

It must be borne in mind that it is unnecessary for the pipe line to extend to the extreme points of the areas to be reclaimed as the water-borne material spreads for a considerable distance in front of the pipes.

It was expected to complete the Colaba area without the additional land booster, by extending the pipe line for a few hundred feet. Such extension would not have affected the output appreciably; any falling off in deliveries would have been compensated for by increased outputs through lengths of less than 5,000 feet.

---

* Not reproduced.

The Marine Lines area contains 2½ million cubic yards beyond the actual 5,000 foot radius, and whether the reclaiming of this area justified the purchase of an additional shore booster was, as I have already stated, a matter that might be well left over for future consideration, and in my report I had pointed out that by increasing the number of intermediate pumping stations there would be no difficulty in discharging any distance.

The estimate for the dredger, one booster and 13,500 feet of pipe line, plus working expenses, came to 5.90 annas per cubic yard, whilst in the general estimate 8 annas was allowed to provide for contingencies of this nature.

Tenders from other firms for dredging plant were taken in February 1920, by my partner the late Mr. C. S. Meik during my absence in India.

Messrs. Simons & Co's. tender, including 10 per cent. for extension of time to March 1920, amounted to £496,650 against the tender submitted by Messrs. Lobnitz & Co. for £840,000. It is correct that Messrs. Lobnitz & Co's. tender included 19,000 feet of pipes as against Messrs. Simons & Co's. 13,500 feet and two dredgers as against Messrs. Simons & Co's. one dredger and an intermediate pumping station on a pontoon, but Mr. Meik probably weighed the extras contained in Messrs. Lobnitz' tender against the cost, and formed the opinion that the proposals of Messrs. Simons & Co., were sufficient for carrying out the work. Hence his cablegram to me in Bombay.

(X.)

Dates of Sir G. Buchanan's visits to Bombay. Put in by himself.

1919 :
Arrived Bombay, 19th May.
Left Bombay, 31st May.
Arrived Bombay, 15th November.

1920 :
Arrived Bombay, 15th November.
Left Bombay for Burma, 18th December.

1921 :
Arrived Bombay, 9th January, from Burma.
Left Bombay for London, 19th February.
Left London for Bombay, 17th November.
Arrived Bombay, 3rd December.
Left for Baroda, 9th December (evening).
Arrived Bombay, 11th December (morning).

1922 :
Left for Kutch, 9th January.
Arrived Bombay from Kutch, 20th January.
Sailed for London, 25th February.
Arrived Bombay, 4th December.
Went to Calcutta for Christmas holiday, 22nd December.

1923 :
Arrived Bombay, 1st January.
Left Bombay for London, 20th January.
Arrived Bombay, 13th July.
At Mussoni, 15th to 21st July.
Went to Baroda, 28th July (evening).
Arrived Bombay, 30th July.
Left Bombay for London, 11th August.
Arrived Bombay, 28th December.

1924 :
Left for Baroda, 5th January (night).
Arrived Bombay, 8th January.
Left for Dwarka, 12th January.
At Bombay, 17th January.
Left Bombay for London, 16th February.
Arrived Bombay, 24th October.
Went to Dwarka, 15th November.
Arrived Bombay, 20th November.
Left for Nagpur for Christmas holidays, 23rd December.

1925 :
Left Bombay for Australia, 7th January.

(XI.)

Letter dated 14th February, 1921, from Sir G. Buchanan to the Director of Development.

MY DEAR HEPPER,

I send herewith the draft programme of operations which completes the various items I said I would dispose of before leaving for England.

Yours sincerely,
(Sgd.) GEORGE BUCHANAN.

Enclosure.

BACK BAY RECLAMATION SCHEME, BOMBAY.

Programme of Operations.

We are now in a position to summarise what has been done in the preliminary stages and to formulate a programme for the immediate future.

Tenders have been received from contractors for the building of a concrete block wall 8,000 feet long at Colaba, but as no tender was satisfactory from either the economic or technical point of view and the best source of supply of stone is undoubtedly the Government quarries now being opened out at Kandivlee, it has been decided to revert to the original design, for a rubble wall with the exception of the first 2,000 feet, and to carry out the work departmentally. The first 2,000 feet will be of concrete in mass as originally intended.

On the assumption that actual wall construction at both ends will begin early in October, the following works will have to be executed before that date.

Quarries.

The greater part of the machinery has been ordered and will be coming forward within the next few months. Work to be put in hand comprises erection of machinery, workshops and power house, construction of quarters for staff and workmen, laying of railway sidings and connection with the B.B. & C.I. main line, opening out working face at quarries and general organisation of operations to ensure an output of 800 tons per diem. The latter figure constitutes a large quarry and entails a highly efficient organisation.

Chowpatti and Marine Lines.

Between these two points will be situated the main depot and works construction yard. The first and most urgent work is the connection with the B.B. & C.I. Railway at Chowpatti and the laying out of the yard sidings which will require to be sufficient to deal with stone trains for Marine Lines and for Colaba respectively and also general traffic in connection with the works.

There will be considerable work in connection with erection of machinery, store sheds, cement sheds, staff and workmen's quarters, etc., and general preparations for construction.

Colaba.

It is intended to utilise the stone from the reef for the 2,000 feet of mass concrete wall and it will be necessary to erect stone crushers, concrete mixers, cranes, collect sand and cement, make arrangements for shuttering and provide accommodation for staff and workmen. A light railway will also be required from the mixers to and along the wall. It is hoped to build the 2,000 feet of wall in one working season and meanwhile the through railway line along the foreshore and foreshore road to connect with the line from Chowpatti will be put in hand and must be ready for the working season 1922-23.

Permanent Works.

It is confidently hoped to begin work at both ends on the 1st October, 1921, on the following lines :—

Marine Lines.—The sequence of operations will be as follows :

(1) Drive gantry piles and construct gantry.

(1A) Lay apron of large stones on 2 feet of small 20 feet wide, at the toe of the wall on the sea side.

(2) Tip rubble stone from wagons on gantry.

(3) Build on rubble mound, mass concrete superstructure.

Once the work is in full swing, we shall aim at advancing at the rate of 30 feet per diem and to complete 3,000 lineal feet in the season, but that entails driving 8 to 10 gantry piles a day and handling and fixing 375 cubic feet of timber, depositing 16,000 cubic feet of stone rubble and placing 142 cubic yards of concrete in the wall.

These figures are given to show that the task is by no means a light one.

Colaba.—We shall be well satisfied if the 2,000 feet of mass concrete wall is finished in the season of 1921-1922 and arrangements will be made to proceed in 1922-23 exactly as specified above for Marine Lines.

Dredger and Pipe Lines.—The dredger under present arrangements will probably arrive about October, 1922, but meanwhile there is an immense amount of work to do in laying the three pipe lines across the peninsula. The longest and most difficult line is that which runs from the Harbour down Ormiston Street through the Y.M.C.A. Grounds under the B.B. & C.I. Railway to the north of the Baths and thence along the ride to a point between Church Gate Street and Marine Lines Station. This work can probably be let by contract for a portion of its length. The other two pipe lines present no difficulty.

The dredger will probably begin operations at Colaba Point, discharging through pipe line No. 1, and I hope that some 200,000 square yards will be reclaimed in the working season 1922-23.

Other work.—A work which is not urgent but must be arranged for is the prolonging of the storm water drains from the present sea-front to outside the new wall.

It should be noted that the programme outlined above does not include the East Colaba Reclamation, and if this is to be taken in hand in the near future by the Back Bay staff, and we are to be entrusted with the working arrangements and supervision we should like to receive instructions as soon as convenient in order that we may arrange for the work to proceed without in any way interfering with the progress of the Back Bay Scheme.

(Sgd.) GEO. C. BUCHANAN.
15th February, 1921.

Letter dated 12th May, 1922, from Director of Development to Sir G. Buchanan.

My Dear Buchanan,

Your letters of 11th and 27th April. Lewis was in hospital for several weeks and has not been at all fit since he came out. In his present condition, he is not up to the job. He will go before a medical board before leaving and will, of course, have to be passed fit by the medical board at the India Office before he returns.

2. I went through the question about rolling stock, etc., with Lewis, and the result was the telegram he sent you. With the exception of the portal crane for Colaba, it seemed to me to be advisable to order the plant. Your remarks regarding the construction of the rubble mound at Colaba raised a question as to whether it would not be safer at Marine Lines to defer building the mass concrete wall until the rubble mound had had one monsoon to test it. Your reply to this is indefinite, but I do not think it wise to order the cement. We can probably get it later at the same price if necessary.

3. I several times suggested to Lewis that in view of the fact that no heavy protection blocks can be placed at Marine Lines before the monsoon, it might be better to defer the mass concrete wall at Marine Lines till next cold weather. My idea was that any weak points in the mound could be made good during the monsoon and no real damage could be done. On the other hand, serious subsidence or distortion of the mass concrete might be disastrous. I use the word from the political more than the engineering point of view. Criticism has died down but the critics and pessimists are there, and I am most anxious that no excuse should be given for a renewal of the agitation. Lewis, however, argued that the cement would go bad if not used, and in any case, both he and Elgee made light of my apprehensions and the work of constructing the mass concrete wall is feverishly proceeding. I hope they are right.

4. The stone tipped between the piles does not form much of a slope as the material seems to be jammed by the wood work. They are now tipping big stones on the outer face, and, although in my view, it still looks far from safe, I am hoping that the monsoon will be late and that it will be possible to make a good slope on the outer face of big stones before the attack begins. I do not like risks being run because as indicated in the preceding paragraph, I do not think we can afford them.

5. I am sorry the matter of reporting the arrival of the " Sir George Lloyd " and " Colaba " was overlooked. A telegram is being sent to-day.

6. The remarks about accounts, and also about additional engineering staff, in your report, were referred to Lewis immediately, and he was asked to consider them and to submit any recommendations he had to make. So far, he has produced nothing but he promises to let me hear before he leaves. In any case, as Mr. Reith wants the same pay as Elgee, I doubt if he can be employed.

7. After endless delays, the railway to Colaba has been begun and I hope that under a different regime it may be possible to get it finished by October. The progress at Colaba is disappointing, but I think Billinton has done wonders considering the few facilities he has, and the cramped nature of the situation. I attach for your information, copy of a note I recently sent to Lewis about the programme for next year.

8. As a result of your recommendation not to build the mass concrete wall at Colaba till year after next, Lewis now talks of beginning pumping in October, 1924! However, we can discuss that next cold weather.

I am not leaving Bombay until 8th July.

Yours sincerely,

(Sgd.) L. HEPPER.

Enclosure.

In view of your approaching departure on leave it is, I think, desirable that definite proposals for the programme of work to be carried out on the reclamation next season should be put on record.

2. So far, our energies have been directed mainly to the Marine Lines part of the work and at the commencement, in the absence of information as to the proposed layout, there was no particular reason for any special preference being given as between Marine Lines and Colaba.

3. Mr. Davidge's preliminary layout plan has, however, now been accepted in the main and it is evident, looking at the reclamation as a commercial proposition, that it is the portion of the reclamation from Colaba northwards as far as Mayo Road that is of the first importance, a view which receives further support from the agreement we have come to, to sell 265 acres at the southern extremity of the reclamation to the Military Department in an undeveloped state.

4. It is in fact now apparent that, in order to begin to realise money by sales to the Military and the public as early as possible, we must concentrate on Colaba and reclaim from the south by sections, the sections being conveniently formed by bunds following the main roads running at right angles to the sea wall.

5. Our progress to date, however, has been greatest at the Marine Lines end of the work, where 2,000 feet of wall has been constructed behind which we are not likely to do any filling for 6 or 8 years. The main question is whether we can continue the wall at Marine Lines next season without limiting the length of wall which we might otherwise construct at Colaba. If, by closing down Marine Lines next year, we can thereby do more at Colaba then there is, I think, a strong argument for adopting that course.

6. It is, I take it, mainly a question of the supply of stone which is definitely limited by our transport facilities, and I am anxious that the Colaba work should be treated as of the first importance, Marine Lines being looked on as secondary only, and that the former should not suffer by any mistaken desire for rapid progress at Marine Lines which to a certain extent amounts to putting our money in the wrong place at the present stage.

7. The reclamation behind the first 6,000 ft. of wall from Marine Lines will bring us no return, and economically speaking should have been left to the last. We cannot help that now, but we can adjust our future programme to enable us to start filling at the earliest possible date, areas which are to be sold. Subject to engineering requirements being met, it is obviously desirable, having regard to interest charges, to restrict expenditure, in the beginning to work which will be directly remunerative.

8. I shall be glad if you will consider the matter in the light of these remarks and let me have before you leave, your recommendations as to the programme for next year.

Deputy Director (to see)

Chief Engineer,
Reclamation Branch,

Letter dated 3rd June 1922, from Messrs. Meik & Buchanan to the Chief Engineer, Reclamation Department.

Reclamation Department,
Directorate of Development.

DEAR SIR,

We desire to address you on the subject of the relationship between yourself as the Resident Engineer, nominated by us for carrying out the Back Bay Reclamation Scheme, and ourselves as the Engineers of the Secretary of State in carrying out the scheme because we feel that we are not being kept in sufficient touch with the work or supplied with the information necessary for the due performance of the duties specified in our agreement with the Secretary of State. This has not always been the case, as last year after Sir George Buchanan's annual visit, we were kept fully informed by Mr. Lewis as to what was going on, and in addition to official letters he wrote a demi-official letter to Sir George Buchanan nearly every mail. This year, however, a veil appears to have dropped between us and since Sir George Buchanan left Bombay on the 25th February, we have practically had no news of any kind as to the progress of the works for which we are the Engineers, responsible to the Government of Bombay and the Secretary of State.

2. We beg to remind you that before leaving Bombay, at the end of February, Sir George Buchanan writing on our behalf as per copy enclosed, requested that we should be furnished with a monthly report and expenditure statement, and on the 12th April, we wrote from this office sending forms of progress report to be filled up. To neither of these letters have we received an acknowledgment.

3. In Sir George Buchanan's report to the Director dated 11th February 1922, and subsequently endorsed by us, a number of questions were raised which the Director in his letter dated 15th March, said would be taken up with you. We are anxious to know what action has been taken on each of the points raised by Sir George Buchanan, and in particular on the proposals contained in para. 41 of his report for concentrating on the following works :—

(1) Railway connection between Colaba and Marine Lines.

(2) Preparation of terminal arrangements at Colaba and purchase of end tipping wagons.

(3) On completion of Numbers 1 and 2, construction of stone mound to a distance of 10,000 feet from Colaba and cross bunds as required.

(4) Erection of dredger's floating pipe line and laying of the land pipe line for the dredger to serve that area.

4. In para. 27 of the report, Sir George Buchanan said it was impossible to fix a date for starting the dredger and that had it not been for the delays in beginning the work last season, he was of opinion that wall construction should have advanced sufficiently to make it worth while beginning dredging operations at the end of this year and that this possibility should still be kept in view, one pipe line being laid across the peninsula in order to be ready for eventualities.

The above proposals have our entire concurrence. We think a great effort should be made to advance the Colaba work sufficiently to do some dredging before the advent of the 1923 monsoon, and we cannot accept the views expressed by Mr. Lewis to the effect that no dredging should be attempted until the sea wall was complete up to the top. We adhere to our opinion that it would be quite practicable and indeed desirable to begin reclamation in the Colaba area so soon as the rubble mound had been deposited up to high water mark and we do not attach any importance to Mr. Lewis's fear that the areas under reclamation would be liable to be flooded by any tide higher than 86·25 because in any case the sea must pass through the porous rubble wall for a long time to come.

5. Other points on which information is desired are as follows :—

(*a*) On the 4th April, we wrote asking for a detailed report showing the points, raised by the Chief Inspector of Boilers, Bombay, for all boilers despatched, in order that we might take the matter up with the manufacturers in this country. We received an acknowledgment to this request in your letter dated 21st April 1922, but up to the present the report asked for has not been received.

(*b*) On the 24th November, we wrote to you with reference to the Ingersoll Rand contract, a portion of which was supplied from America, and we asked to hear whether the whole of the items embraced in the contract had been safely received. We are being pressed by the India Office for a reply to this question in order that they may close their files on the subject.

(*c*) We have not as yet received a copy of the Project Estimate which has presumably been submitted to Government, nor have we received the current Budget Estimate of Expenditure for the year 1922-23. We have not even been informed of the arrival of the dredger " Sir George Lloyd " or of the auxiliary dredger " Colaba "; the condition in which they were delivered or where they have been placed.

(*d*) In Sir George Buchanan's letter dated 22nd January to your address, he asked to be furnished with some information as to the quality of the Portland cement being used and we shall be glad to have a reply to that letter and some records of cement tests.

(*e*) When the works were started it was Mr. Lewis's expressed intention to obtain a complete photographic record of the progress of the works, and to that end three photographic cameras, complete with accessories and chemicals, etc., were purchased by Mr. Lewis at a cost of £234. One of these cameras is in use at the quarry where some valuable records have been taken but we have seen no photographs of the works at Marine Lines or Colaba.

(*f*) We are very anxious about the expenditure on the works and if Sir George Buchanan's recommendations have been carried out, you should by this time have a proper cost accounting staff without which it will be quite impossible to exercise economy and have a check on expenditure.

(*g*) We have heard unofficially, that Mr. Lewis has been a considerable time in hospital, and further that he was expected to take leave some time in May but we have no knowledge officially of any change.

6. Finally, we would say that we fully appreciate the difficulties you are encountering in carrying out departmentally a work of such magnitude and we should be the last people to contemplate adding to those difficulties.

We know that in the matter of details in connection with the execution of the works you are taking the place of the contractor and as far as possible the man on the spot must be allowed to use his unfettered discretion. That need not, however, prevent your keeping us fully informed as to the progress and cost of the works, and asking us to advise on all matters where you think you should be benefited thereby, because it is impossible to ignore that fact that under our agreement with the Secretary of State we are appointed the Engineers in carrying out the scheme and in the construction and execution of all works connected therewith until their final completion, and we are specifically instructed to assist and advise the Government of Bombay in all matters relating to the execution of the works and to perform all works and duties devolving upon Engineers of large works.

We are, dear Sir,

Yours faithfully,

(Signed) C. S. MEIK & BUCHANAN.

Letter dated 8th June 1922, from Sir G. Buchanan to the Director of Development.

(Confidential.)

MY DEAR HEPPER,

Since writing to you on the 3rd June, I have received your confidential letter of the 12th May.

With reference to the building of the mass concrete wall on the rubble mound at Marine Lines we have always been adverse to the proposal as we considered the rubble mound should have at least one monsoon to settle down. I argued the point at length with Lewis when I was in Bombay, and when he pointed out that if we adhered to our views it would wreck his programme of work for the season and that he proposed to finish a length of wall complete with the protection blocks on the outside, I rather reluctantly gave way.

On the 2nd March, before my arrival home, Mr. Meik wrote to Lewis as follows :—

" If you adhere to your intention of building the concrete wall or blocks on the rubble within a month or two after the rubble is deposited, you are certain to have a considerable settlement, perhaps a foot or more. In this case, the proposal, as on sketch No. 332, would be the best as the space intervening between the blocks will allow any irregularities in the front face of the wall to be made up better, but the cost would be rather higher than either of the other proposals."

On the 4th May we received a cablegram from Lewis in reply to a letter from us dated 11th April saying, amongst other things, and with reference to paragraph 6 in our letter—

> " . . . mass concrete wall is now under construction Marine Lines as originally arranged for and recognised in your report of 11th February, but heavy protection blocks cannot be placed before monsoon as portal cranes only now arriving full stop. As supplies cement for next year have to be arranged by end of May do you definitely recommend next season work Marine Lines should consist of 3,000 feet gantry and rubble mound only."

Paragraph 6 in our letter was with reference to Colaba only, and Mr. Meik and I were seriously concerned with the statement that heavy protection blocks at Marine Lines could not be placed before monsoon, but as at that date the monsoon was only two or three weeks off we gathered most of the work was finished and that it was, therefore, useless to make a protest. Further, as even in the monsoon there are a number of hours every day when the crane could work, we supposed that the outside protection blocks would be placed before there was any likelihood of much damage and we trust that this has been done.

Your letter amply confirms the fears I have already expressed in my letter of the 3rd June, and there is not the slightest doubt that a drastic change is necessary in administration and execution of the works, and if Lewis, either through illness or other cause, is unable or unwilling to carry out our instructions it will be better for every one if he does not return.

In the matter of dredging, it seems to me that for some reasons of his own, Lewis has made up his mind to delay operations as long as possible and to begin reclamation at Marine Lines instead of at Colaba. I am very disappointed indeed to hear from you that the railway to Colaba is only just begun because so far as I am aware there was nothing to prevent it being by this time very nearly finished.

Yours sincerely,

(Signed) GEO. C. BUCHANAN.

SIR LAWLESS HEPPER,
Directorate of Development,
Old Custom House Yard,
Bombay.

(XII.)

Note by Sir George Buchanan regarding the estimate on page 29 of the Report of 1919.

My estimate dated 1919 contains all the necessary information to enable any responsible person to form an opinion as to its reliability. It contains very much more detail than Mr. Kidd's estimate, although Mr. Kidd's was supposed to be a working estimate whilst mine was in point of fact the usual preliminary engineering estimate which an engineer makes to his client. It was accompanied by no working drawings and was not supposed to contain details.

Mr. Kidd, on the other hand, is supposed to have prepared and submitted a complete detailed working project, which was accompanied by 10 sheets of drawings. It was handed to me as such for examination and report. The Government of Bombay in sending this scheme to the Government of India had observed

> " the drawings might be considered as complete working drawings which would give sufficient information for examination of the design and for the immediate commencement of the work. All doubtful points had been settled and the revised estimate might be accepted as completely trustworthy and ample."

I repeat that Mr. Kidd's estimate was devoid of detail whilst mine was full of detail in comparison with the estimate of Mr. Kidd.

It is not usual for an engineer to explain in any greater detail than I have done how my estimate was prepared.

It contained at page 13 a comparison of Mr. Kidd's estimate of cost with my estimate of cost for 1912, and under Table B my estimate cost in 1919.

It also contained at page 29 the detailed estimate of the cost of the scheme on my lines, *i.e.*, number of cubic yards of concrete, rubble, concrete blocks, moorum filling, etc., etc., with prices affixed against each.

I will now describe how I arrived at my estimate to Mr. Kidd's scheme 1912.

In the first place it was necessary to take out a complete schedule of quantities for Mr. Kidd's scheme and although Mr. Kidd had given no such schedule in his report we were enabled to do so by taking Mr. Kidd's drawings and from them get out *de novo* the whole of the quantities contained therein. This we did and after putting our rates under each item we arrived at a total of 170·94 lakhs. To this we added Mr. Kidd's item of 59·45 lakhs for roads, lights, and drains, and engineers' and contractors' commission 11·51 lakhs.—Total 241·90 lakhs, against Mr. Kidd's 325·23 lakhs, and we came to the conclusion that Mr. Kidd had over-estimated the work to the extent of 83·33 lakhs.

We then went on to our own estimate and dealt with it in a similar way. We took out the whole of the quantities from information in our office and fixed what we considered were the correct rates and we arrived at a total of 367·71 lakhs.

Our estimate was based on an increase of 2½ times over 1912.

The information I obtained from Bombay and brought home with me is as follows :—

List of prices of work done on the Kennedy sea face in 1912-13 and 1919-20, obtained from Mr. Johnson, Executive Engineer Presidency, in charge of the Kennedy sea face works.

Letter from Mr. Messent, the chief engineer of the Port Trust, dated 30th May, 1919, with a list of prices in Bombay, for various classes of work in 1914 and 1919.

Rate for moorum filling, Improvement Trust Scheme, 1919.

Letter from Mr. Trench, Assistant Secretary to Government, P.W.D., Bombay, containing cost of rubble and cost of stone at Port Trust Quarries.

Note of Mr. Trench, Assistant Secretary, P.W.D., concerning cost of Kennedy sea face wall.

Note giving price of timber by Mr. Pearson.

Cross section of the Mazagon Sewri Reclamation wall, supplied by Mr. Messent, with note of the cost of concrete blocks, 1917 and 1919.

The above information, along with the many records in our office of the cost of works of all kinds enabled us to put prices to our schedule of quantities.

Note put in by Sir George Buchanan on 12th November.

Back Bay Reclamation Scheme—Note on Estimated Cost of Dredging.

In estimating dredging costs two factors must be considered, capital cost of plant per unit and working cost per unit. The capital cost naturally varies according to the quantity dredged, the greater the quantity the less being the capital cost.

In two dredging propositions of say 10 million cubic yards and 5 million cubic yards respectively executed by similar dredgers the capital cost per unit of the large scheme would be less than that for the smaller scheme, if the total cost of the plant was debited against each scheme.

Working expenses, however, are fairly uniform and comparisons can be made with different works.

In my 1919 report and estimate I calculated that capital cost of plant would be 3.24 annas per cubic yard and working expenses 2.66 annas—total 5.90 annas, but in my estimate I allowed 8 annas per cubic yard, an increase of 2.1 annas, or on the total the sum of Rs.32,81,250, say £218,000, whilst dividing 2.09 annas equally between capital and working expenses, we have capital cost 4.39 per cubic yard, working expenses 3.61 per cubic yard.

It has been freely stated that my estimate of 8 annas was too low because Mr. Kidd's tender, made in 1912, was 9 annas 3 pies per cubic yard.

I again assert most positively that my estimate was a reasonable one and that Mr. Kidd's was excessive.

Mr. Kidd gave no details in his tender but in the course of his evidence before the Committee said his dredging plant was estimated to cost in 1912 £287,625, which converted to rupees at 15 and divided by 24,162,463 comes to 2.86 annas per cubic yard. I consider his price for plant in 1912 high, but assuming that amount is allowed there is left for working expenses 6.39 annas against my figure in 1919 of 3.61.

The easiest way to see which figure is correct is to take reliable figures of cost of dredging executed elsewhere about that time and I will therefore quote figures in my possession which I used to check my estimate.

Twante Canal, Burma.—This project was the nearest in approach to the Bombay Scheme.

Three suction cutter pipe line dredgers were used, the material was clay and silt, and the total working expenses for the 6 months ending 30th June, 1915, was annas 1.83 per cubic yard and for the previous 6 months 1.88 annas per cubic yard, and from the beginning of the work in 1912 the dredgers had excavated 10,420,000 cubic yards, the total working expenses being 2.01 per cubic yard.

To take some more examples from my records—

Dredger "Pelican."—The suction pump dredger "Pelican" working in Rangoon in 1912 and 1913 in sand and silt, moved two million tons at a total cost for working expenses of 1.90 annas per cubic yard.

The Suction Dredger "Bolari."—This is a large suction hopper dredger working on the Hooghly and an analysis of her work in 1914 gave total working expenses of 8.40 pies per cubic yard.

The Suction Cutter Pipe Line Dredger "Foyers."—Working in Bengal in 1914 moved 3,200,000 cubic yards at a total working cost of 10 pies per cubic yard and working from 1908 to 1915 moved 14,230,000 cubic yards at a total working cost of 1.16 annas per cubic yard.

These examples from actual work done are, I think, sufficient and surely with these figures before me I was justified in thinking Mr. Kidd's estimate of 7.12 annas most excessive and my estimate of 3.71 annas ample—the difference between Mr. Kidd and myself on the whole 25 million cubic yards being Rs.53,22,000 or over £350,000.

I have no information in detail as to the cost of dredging in Bombay on the Back Bay Scheme and am perfectly satisfied that with proper organisation and continual working enormous economies can be effected.

(XIII.)

Letter dated 31st July from Sir George Buchanan to Lord Lloyd.

DEAR SIR GEORGE,

I began a letter to Your Excellency some time ago but decided, as Sir Lawless Hepper was on his way home, to wait until I had seen him as I know you have quite sufficient worries without my adding to them.

At our last meeting in Bombay I told Your Excellency that there seemed to be some misapprehension as to our position, that Mr. Lewis appeared to be regarded as the chief engineer in fact as well as in name and that at the meeting of the Advisory Committee I was not even introduced to the members.

After my return home we were very much concerned at the absolute cessation of all letters and reports from Mr. Lewis, and on the 3rd June, 1922, I wrote a strong letter of remonstrance and sent a copy to Sir Lawless Hepper. Since then, and I think principally because Mr. Lewis has gone on leave, the veil has been lifted and we are getting our reports by nearly every mail.

Sir Lawless Hepper called here on the 26th instant, and I showed him a letter, of which I enclose a copy, the original having been despatched. The letter speaks for itself, the gist of it being that we should like to do our job according to our reading of the agreement, but Mr. Lewis, either through ill-health or a misconception of our position has been keeping us in the dark and treating us as consultants.

Sir Lawless Hepper now takes our view and the matter will have to be cleared up if and when Mr. Lewis returns to duty.

I am leaving for South Africa next week to report on a very large harbour scheme for the Government of the Union of South Africa but it will not interfere with my usual visit to Bombay, and as Your Excellency will see from our letter we wish to send out ahead of me a particularly experienced member of our staff to collect information and be ready to assist me on my arrival.

I have written this letter because I know how very interested Your Excellency is in everything connected with the Back Bay Scheme, and believe you will like to hear of any difficulties direct from me.

Yours sincerely,
(Sgd.) GEO. C. BUCHANAN.

HIS EXCELLENCY SIR GEORGE LLOYD, G.C.I.E., D.S.O.,
Governor of Bombay.

Enclosure.

26th July, 1922.

To, THE DIRECTOR OF DEVELOPMENT.

DEAR SIR,

We have the honour to acknowledge receipt of your letter No. D.B. 164, dated 4th July, 1922, forwarding project estimates for the Back Bay and East Colaba Reclamation Schemes, on which we beg to make the following observations.

Back Bay Scheme.

The estimate accompanying Sir George Buchanan's 1918 report amounted to lakhs 367.61 which was increased by Government to four crores. In June, 1921, Mr. Lewis, the Chief Engineer; Reclamation Branch, prepared a revised estimate amounting to lakhs 703.17 which was only submitted to us demi-officially, and we could therefore only express demi-officially our disagreement with the figures and our surprise that the estimate should have been prepared without our knowledge.

In 1922, Sir George Buchanan, after a very complete investigation, made a report dated 11th February, 1922, accompanied by a revised estimate amounting to a nett cost of lakhs 598.89. This estimate was prepared as far as possible in consultation with the Chief Engineer, Reclamation Branch, and from actual costs of the work at the time, but it was understood that in order to conform to the rules of the Government of India in the Public Works Department, what is known as a detailed project estimate would be required which was to be prepared in the office of the Chief Engineer, Reclamation Branch. The total nett amount of this project estimate is lakhs 697.79, or lakhs 98.90 over and above Sir George Buchanan's estimate and the accompanying sheet shows the comparison under the various heads. The chief difference is under roads, lights, and drains. The original pre-War estimate was 75 lakhs which Sir George Buchanan increased to 135 lakhs. Mr. Lewis has gone into the matter in more detail and estimates, roughly, the cost at 211.91. This figure is an enormous one and cannot be accepted without careful examination and a great deal more information.

Another matter that attracts our attention is the estimate of 18.70 lakhs over and above Sir George Buchanan's estimate for the sea wall on rubble mound, and we notice that the Chief Engineer, Reclamation Branch, has allowed 9,811 hundred cubic feet of concrete more than Sir George Buchanan and 161½ tons of steel reinforcement which was not included in our design.

We most respectfully suggest that having regard to the difference in the project estimate and the revised estimate Sir George Buchanan prepared last February, it would have been reasonable if the Chief Engineer, Reclamation Branch, had furnished us with a copy of his estimate and allowed us to make our comments on the same before its submission to your Government.

We are afraid that there exists a misapprehension as to the relationship between the Chief Engineer and ourselves or it may be that we have misinterpreted our agreement with the Secretary of State in which case we shall gladly conform to your reading of the terms. According to the memorandum of agreement we agreed to act as the engineers to the Secretary of State in carrying out the said scheme and in the construction and execution of all works connected therewith until their final completion. We were at all times to assist and advise the Government of Bombay in all matters relating to the execution of the works and were to supervise the same and undertake all works and duties devolving upon engineers of large works. The agreement further provided that a Resident Engineer and a Deputy Resident Engineer should be nominated by us to carry out the details of the work in accordance with our instructions, subject to the control of the Director of Development or other official appointed by the Government of Bombay.

We understand that the Resident Engineer has had his title changed to Chief Engineer, Reclamation Branch, because there would probably be other works than the Back Bay Scheme to perform, but the change of title does not presumably affect his relationship to ourselves, and on every point connected with the design of the work we expect instructions to be taken from us. The Chief Engineer, Reclamation Branch, has, however, in his project estimate report, called us the Consulting Engineers in which case he, as the Chief Engineer, would only consult us when he felt disposed so to do.

Another point on which we desire guidance is the amount of supervision and control expected from us in connection with the execution of the works as apart from the design. The work being done departmentally, the Chief Engineer takes the part of the contractor and if a contract had been let for a fixed sum we should not have interfered with the contractor's discretion in the matter of plant or details of construction unless we thought the ultimate completion of the work would be affected. On the other hand, if the contract had been let on a time and line basis we should have considered it to be our duty to scrutinise all arrangements and all expenditure.

We interpret our agreement to mean that we are the actual responsible engineers, that we are designing all the works and that whilst in the various details for carrying out the work a fairly wide discretion should be left to the Chief Engineer, we must be kept in continual touch with all that is going on and allowed to express our views, and if necessary criticise the Chief Engineer's actions. If our interpretations meet with the approval of Government we suggest that it should be made clear by you to the Chief Engineer, Reclamation Branch, and an end thus put to a misunderstanding which must give rise to friction and will certainly interfere with the successful and efficient carrying out of the work.

We may add that we have under consideration to send out at the end of the monsoon the Senior Engineer on our staff, a gentleman with great experience in the practical carrying out of work to make a thorough investigation on our behalf and gather together information to be placed before Sir George Buchanan on his arrival at Bombay, but this can only be done if we have the willing co-operation of the Chief Engineer, Reclamation Branch, who, if he wishes to do so, can make not only our assistant's visit but Sir George Buchanan's visit fruitless.

East Colaba Scheme.

We note that Government have not appointed us Engineers for this project and trust that this is not a final decision as we see our way to making considerable saving on the project estimate. We would also point out that the two schemes are so closely allied as to really form one work, especially as construction will be proceeding on both at the same time; the same plant is to be used, the same source of supply, along with the same engineering and supervising staff; questions will constantly arise equally affecting both schemes and it will be almost impossible for the engineers of the one scheme to be unconnected with the other.

We may add that we are quite willing to meet your Government in the question of fees which do not concern us so much as the difficulties we see before us if we do not control, for engineering purposes, the construction of both projects.

We are, dear Sir,
Yours faithfully,

(Sgd.) C. S. MEIK & BUCHANAN.

(XIV.)

List of Drawings of Works prepared by Messrs. C. S. Meik and Buchanan in London and sent to Bombay.

COLABA SECTION (CONTRACT).

Drawing No.	*Date.*	*Description.*
*	Dec. 1920.	Specification.
3164	18.11.20.	Plan with contours showing position of wall.
3165	18.11.20.	Section on line of sea wall, South Colaba.
3166	18.11.20.	Cross-sections of ground to be reclaimed.
3167	18.11.20.	Three sections of wall—details of parapet, coping, tidal flaps, etc.
3168	18.11.20.	Longitudinal and cross-section of rubble cross bank.
3314	12.1.22.	Plan and sections of proposed arrangement for transferring stone,
3315	12.1.22.	from side to end tip wagons.
3321	2.2.22.	Proposed arrangement for tipping—Colaba wall—showing concrete pier and steel girders.
3322	2.2.22.	Proposed arrangement for tipping—Colaba wall—showing rubble mound.
3323	2.3.22.	Proposed arrangement for tipping—Colaba wall—showing elevations.

NORTH SECTION—MARINE LINES.

*	16.11.20.	Specification.
3169	18.11.20.	Enlarged plan of blockyard.
3170	18.11.20.	Cross-section of cross-wall in moorum.
3180	18.11.20.	General plan with contours showing line of wall.
3181	18.11.20.	Longitudinal section on line of wall.
3182	18.11.20.	Three cross-sections of wall on rubble bank.
3183	18.11.20.	Two sections showing crane road and timber gantry also temporary work.
3184	18.11.20.	Plan and sections of pipe lines (3) through Peninsula. (3 No. drawings.)
3185	18.11.20.	Plan section and elevation of timber moulds for blocks.
3186	18.11.20.	Plan section and elevation of reinforced concrete blocks.
3187	18.11.20.	Borings in harbour, copies from L.K. & Co.'s plan.
3188	18.11.20.	Sections 19, 20 and 21, copies from L.K. & Co.'s plan.
3189	18.11.20.	Plan showing blockyard, works, sidings, etc.
3243	14.4.21.	Plan showing alternative position of pipe line No. 3.

Drawing No.	*Date.*	*Description.*
3244	26.4.21.	400 ft. plan of Bombay showing scheme of operations with dredging and filling quantities thereon.
3257	23.6.21.	Plan of Back Bay showing rock outcrop, soundings and line of wall.
3259	24.6.21.	Section of wall with detail of parapet as amended.
3330	2.3.22.	Construction of sea wall.
3331	2.3.22.	Construction of sea wall—first alternative proposal.
3332	2.3.22.	Construction of sea wall—second alternative proposal.
3409	20.4.23.	Plan showing storm water drains.
3414	20.4.23.	Cross-section of proposed blockwork drain.
3415	20.4.23.	Average cross-section of No. 7 drain.
3411	4.5.23.	Plan of proposed programme for commencement of dredging.
3431	21.6.23.	Cross-section of Marine Drive showing levels.
3411	27.7.23.	Plan of proposed programme for commencement of dredging.
3428	27.7.23.	Borings in Back Bay.
3437	1.8.23.	Plan of Back Bay showing position of levels required.
3463	8.11.23.	Plan showing proposed programme of work to complete wall and dredging.
3466	8.11.23.	Plan showing position of cables in Back Bay.
3470	13.12.23.	Part elevation of parapet wall.
3471	13.12.23.	Details of parapet.
3472	13.12.23.	Proposed pier in Back Bay.
3456	13.12.23.	Proposed steps in sea wall.
3459	13.12.23.	Proposed steps in sea wall and pilaster.
3474	4.1.24.	Plan of Back Bay giving dimensions for lay-out of roads.
3475	4.1.24.	Plan of Back Bay showing position of cables.
3496	8.5.24.	Plan of dredging in Back Bay.
3610	12.2.25.	Reference plan to fix position of dredger in progress reports.

EAST COLABA RECLAMATION.

	23.10.23.	Specification.
3454	20.9.23.	Plan showing proposed position of New Military Pier.
3460	30.10.23.	Plan showing sea wall and sections of wall.
3461	30.10.23.	Details of drains and coping.
3616	19.3.25.	Cross-section of mound and wall, showing proposed reduction in width.
3435	27.6.23.	Proposed lay-out, plan and section.

GENERAL.

Numerous other drawings in connection with the ordering of plant not included in the above.

(XV.)

Extract from Sir George Buchanan's Diary.

8th February, 1921.

Meeting with Hepper at 11 a.m. to discuss the tenders for the Colaba contract. Lewis present and all agreed it should be departmental.

(XVI.)

The question of the single stage pump on the "Sir George Lloyd."—Statement by Sir George Buchanan.

Sir Frederick Hopkinson asks why a single stage pump was used at Bombay whereas at Rangoon there was a double stage pump.

There was not a double stage pump at Rangoon. There were two pumps.

Why the "Sir George Lloyd" had a single stage pump instead of a double stage pump is a question which should be addressed to the Builders and to Sir John Biles, the Naval Architect.

(XVII.)

Supply of 20-ton crane.—Letter of 16th November, 1920, from Mr. C. S. Meik to Sir G. Buchanan.

DEAR BUCHANAN,

Bombay Back Bay Reclamation Scheme.—Cranes.

As no doubt Lewis has told you, he has now got the orders placed for practically the whole of the machinery, including the cranes.

In the matter of the cranes, I have been into the whole question with Lewis and we have come to the conclusion that it would be better to defer ordering the cranes to deal with the concrete blocks until it is ascertained whether or not we are going to get really sufficiently large stone from the quarry to protect the sea face. I enclose you a memo. that Lewis has handed me in this connection and with which I cordially agree. There is no doubt that if we can get stone of large enough size from the quarry it will mean the saving of a great deal of money.

* * * * * *

* * * * * *

Yours truly,
(Sgd.) C. S. MEIK.

Enclosure.

16, Victoria Street,
Westminster, S.W.1.
15th November, 1920.

Messrs. Ransomes & Rapier, Ltd.,
32, Victoria Street,
Westminster, S.W.1.

DEAR SIRS,

With reference to your letter, No. 11,671, of 12th November, 1920, I am recommending the Director-General of Stores, India Office, the acceptance of your tender for—

		£
Item 1.	5-ton crane at	3,500
Item 2.	Seven No. 7-ton cranes at £2,850 each	19,950
Item 8.	One 20-ton Portal Steam Crane, max. radius 50 ft., 12 ft. 6 in. gauge track	10,450
		£33,900

all packed for shipment overseas and delivered f.o.b. London.

You will receive formal contract from the Director-General of Stores, India Office. Inspection will be arranged for by Messrs. C. S. Meik & Buchanan on hearing from you of the completion of the cranes.

Yours truly,
(Sgd.) LL. W. LEWIS.

(XVIII.)

Correspondence regarding bonus to dredging staff.

26th February, 1925.

(Through the Director of Development.)

THE CHIEF ENGINEER,
Reclamations Branch,
Development Directorate,
Old Custom House Yard,
Bombay, India.

DEAR SIR,

Bombay Back Bay Reclamation Scheme.

Dredging.

We regret to note from your weekly dredging reports that the output of the " Sir George Lloyd " continues so low, the average hourly output to the date of your last

report, 6th February, gives only 43 per cent. of the designed capacity of the dredger. You have no doubt been able to form a definite opinion as to the cause or causes of the low output and we shall be glad therefore if you will let us have all information on the matter so that we can consider it before taking up the matter with the builders.

The builders' specification states "The dredger is to be capable, under ordinary working conditions, of excavating 2,000 cubic yards per hour of soft clay from depths up to 70 feet below water level and delivering the spoil through a floating steel pipe line 5,000 feet long to an intermediate pumping station."

And of the "intermediate pumping station" the specification states "The dredging pump is to be capable, under ordinary working conditions, of discharging 2,000 cubic yards per hour of soft clay through a pipe line 5,000 feet long to a height of 16 feet above water level."

The two main factors therefore to be considered as affecting the question of output are :—

(*a*) The actual working conditions, and whether they are such as may reasonably be considered to be covered by "under ordinary working conditions" of the specification.

(*b*) The working lengths and height of the discharge pipe.

With regard to (*b*) the total length of pipe line has not, since the resumption of dredging operations this season, according to the weekly reports, exceeded 9,768 feet—the total length for week ended 8th January should be 8,943 feet. Except during week ending 1st January, when the output reached 1,133 cubic yards per hour the length of the pipe line between the dredger and "Colaba" has exceeded 5,000 feet.

The maximum output during this season of 1,222 cubic yards was obtained during week ended 18th December, 1924, when the length of pipe line between the crafts was 5,389 feet, or 389 feet longer than the specified length, though the total length of the line was only 9,271 feet.

The minimum output of 613 cubic yards, except week ended 11th December, 1924, occurred during week ended 6th February, 1925, when the lengths of the pipe line were 5,781 feet and 3,987 feet, or a total length of under 10,000 feet.

These facts are better realised by comparing them as follows :—

Week ended.	Length of Pipe.			Average hourly output for week.	Pumping time percentage of total working time.
	Dredger to Intermediate Pumping Station.	Intermediate Pumping Station to end of pipe line.	Total.		
	L. ft.	L. ft.	L. ft.	C. yds.	
December 18th, 1924	5,389	3,882	9,271	1,222	67·71
January 1st, 1925	4,821	3,882	8,703	1,133	57·78
January 29th, 1925	5,701	3,957	9,658	799	65·87
February 6th, 1925	5,781	3,987	9,768	613	71 37

Assuming that the conditions of working, except the lengths of the pipe line, and the weekly methods of measurements, during the period under review were similar, it is difficult to account not only for the low hourly output but also for the wide weekly variations in the output.

We note the actual pumping time is 67 per cent of the total time worked.

As the output of the dredger and auxiliary craft so largely depends upon the dredging staff, you have no doubt arranged to pay bonus on the output and we shall be obliged if you will let us have a copy of the bonus conditions, also particulars of the method of measurements adopted as the basis of payment and for weekly progress.

We should also like to have a weekly progress return for the "Kalu" similar to that for the "Sir George Lloyd."

The areas in which it is proposed to dredge on the harbour side are shown on a plan which accompanied Sir George Buchanan's report of the 15th December, 1924, Areas K and G appear to have been abandoned and we shall be glad to hear from you the reasons for this alteration from the original scheme.

Yours truly,

for C. S. Meik & Buchanan.

(Sgd.) W. T. HALCROW.

No. 854.

Development Directorate,
Back Bay Reclamation Scheme,
Chief Engineer's Office,
Old Custom House Yard, Fort,
Bombay.

MESSRS. C. S. MEIK & BUCHANAN,
16, Victoria Street, Westminster,
London, S.W.1.

20th March, 1925.

DEAR SIRS,

Reference your letter of the 26th February, 1925.

The principal reasons for the low output of the " Sir George Lloyd " are as follows :—

1. Inexperienced Assistant Dredging Masters.
2. Nature of material dredged.
3. Strong ebb tides.
4. Bad holding ground for anchors.

The influence of the above on the output of the dredger is as follows :—

1.—(*a*) The working of a suction cutter dredger is entirely different from the working of a bucket ladder dredger, owing to the fact that with the latter the individual in charge of the dredging operations can see exactly how much material he is getting in each bucket, whereas with a suction cutter dredger it is quite impossible for him to do so and the only means by which it is possible to tell whether the dredger is getting plenty of material or not is by the vacuum in the suction pipe, as recorded on the vacuum indicator, and also the pressure on the pump as indicated on the pressure gauge. These two indications in themselves are by no means definite evidence that the dredger is getting a fair quantity of material. This can only be told after years of experience and in my opinion it takes 10 years at least to train a man to work a suction cutter dredger satisfactorily even if he is intelligent and takes an interest in his work. I am afraid that at least one of the Assistant Dredger Masters on the " Sir George Lloyd " does not come under this category. If the Assistant Dredging Master is not experienced at this class of work he does not keep the dredger up to her face or else he does not work the cuts systematically.

(*b*) The Dredging Master, Mr. Speirs, was working this dredger last season and the output was very much better than it has been this season in spite of the fact that we did not have the same depth of material last season that we have had this season. Owing to Mr. Speirs having to look after the working of the " Kalu " in Back Bay this season, it has been impossible for him to devote his whole time to the training of the men on the " Sir George Lloyd." On various occasions when he has returned on board the " Sir George Lloyd " this season, he has found that the cuts have not been worked systematically, making it necessary to pull the dredger astern and clean up the high ridges left, which were preventing the suction frame from getting down to the full depth.

2.—(*a*) The material dredged this season has been approximately as follows :—

The top layer of material which has varied from 8 to 15 feet in depth has been fine silt. The underlying material which has varied from 7 feet to 20 feet has been clay or consolidated silt of a clay nature, the bottom 2 or 3 feet of which has been very stiff and interspersed with pinnacles of murum in which the boulders are embedded. Owing to the hard nature of this murum in which the boulders are embedded, the cutter engine is brought up all standing, or the cutter rides over the top and lifts the suction frame up. This naturally lowers the output of the dredger as it is impossible to keep the cutter into the material.

(*b*) The Builders' specification states 2,000 cubic yards per hour of soft clay, but I do not consider the material now being dredged could be classed as soft clay, and I am not prepared to say that the dredger is incapable of pumping 2,000 cubic yards per hour of *soft clay* under ordinary working conditions.

3. During spring tides the ebb is exceptionally strong and runs at times well over 4 knots an hour. This current on the long length of line which it is necessary to have, viz., 5,000 feet to 6,000 feet throws a tremendous strain on the moorings of the pipe line causing the anchors to drag and in turn throwing the weight of the pipe line on to the dredger with the result that it is impossible to keep the latter up to the working face. This has been on occasions so bad that it has been necessary to cease pumping operations for one to two hours over the height of the tide. Even when the dredger has not stopped work on account of the strong tide, she has been pumping a greater percentage of water than necessary owing to the impossibility of keeping the cutter into the face.

4. The greater portion of the sea bed south of the dredging area outside Oyster Rock is composed of loose shingle and stones or a thin layer of mud overlaying rock. This, as is well known, is extremely bad holding ground for anchors. This difficulty was foreseen last dredging season, and each pontoon was provided with two winches and anchors, although the original arrangement allowed for was for every fourth or fifth pontoon only to be provided with winches and anchors. The additional anchors provided were the same as those supplied with the pontoon, viz., 7 cwts., but owing to the difficulty experienced at the commencement of the dredging season in keeping the pipe line in position, six 30-cwt. anchors were obtained and laid out in addition to the 7-cwt. anchors. Even these have proved to be insufficient, and arrangements are now being made for the purchase of about nine more anchors of about 20 cwts.

I do not consider that the length of discharge line has in any way affected the output of the dredger. The maximum length of discharge line between the dredger and the booster pump this season has been 5,781 ft. The dredger is supposed to be capable of discharging 2,000 cubic yards per hour through 5,000 ft. of pipe line. When it is taken into consideration that the booster pump is introduced into the line 781 ft. beyond this distance and will suck the material out of the pipe, I think it will be agreed that the discharge line has not been too long between these two vessels. The total length of the discharge line from the booster pump has not yet reached the supposed maximum length of 5,000 ft. The total length of this line at the end of the last week was only 4,247 ft., in which length there is a difference in height of about 22 ft. at dead low water ordinary spring tides, or about 6 ft. at H.W.O.S.T. This, in my opinion, has had no material effect on the output of the dredger.

No bonus on the output has been arranged for this season owing to the fact that only one of the Assistant Dredging Masters has had any previous training, and I consider it would be throwing money away to fix a bonus at a low rate of output at this stage of the operations to enable the men to earn any bonus.

With regard to a weekly progress return for the " Kalu," as this vessel is only able to work for an hour or two a day every other week and her output is very small, being only about 225 cubic yards per hour owing to the hard nature of the clay under-lying the sand, it is not worth while giving any detailed report similar to that for the " Sir George Lloyd."

With regard to areas K. and G. referred to in the last paragraph of your letter, these have not necessarily been abandoned. During the visit of Sir George Buchanan and Mr. McMurray of Messrs. Simons & Co. in season 1923-24, it was remarked that the dredger ought not to have been started work dredging the material at the nearest point to discharge it at the nearest point on shore, but should have been started to work at the farthest out point of the dredging area to discharge at the nearest point on shore. But work was commenced in this area in accordance with your plan No. 3411, which was handed to Mr. Brims, and which shows the dredger " Sir George Lloyd " to commence dredging in the S.E. corner of area " K." But on investigation it was found impossible to put the dredger to work in the position shown owing to the presence of rock or boulders projecting up above the surface. Moreover, the depth of material available proved to be only about 4 or 5 ft., the majority of this being silt, and it would not have been economical working to attempt to dredge in this position.

It was impossible to commence work this season at the most distant point of the dredging area owing to insufficient floating pipe. This deficiency will not be made up until the pipe now on order from Messrs. Braithwaite & Co. is delivered.

Yours faithfully,

(Sgd.) H. A. ELGEE,

Chief Engineer.

(Through the Director of Development.)

23rd April, 1925.

(Through the Director of Development.)

THE CHIEF ENGINEER,

Reclamations Branch,
Development Directorate,
Old Custom House Yard,
Fort, Bombay,
India.

DEAR SIR,

We are obliged for your letter, No. 854, dated 20th March, 1925, relative to the low output of Suction Dredger *Sir George Lloyd*, and after carefully considering the

reasons therein given for the low output of the dredger, we desire to offer the following remarks and suggestions in the hope that they may help in overcoming the adverse conditions under which the work is being carried out and so improve the output.

The paragraphs are numbered to correspond with those of your letter.

1.- (*a*) The vacuum and pressure gauges connected with the suction pipe and pump, respectively, are aids specially provided for the guidance of the dredging master during dredging operations, and they are to an experienced dredging master, who has made himself generally acquainted with the material being dredged, an almost infallible guide as to the percentage of solid material being dredged and discharged. Particularly is this the case when dredging is in fairly uniform strata, though of varying depths, after a few simultaneous observations have been taken from time to time of the vacuum and pressure gauge readings and of the velocity of and the percentage of solids in the discharge at the end of the discharge pipe. The velocity is generally obtained by measuring the curve of discharge at the end of the pipe, and where this cannot be done by a pitot tube, which can be made on the works from $\frac{1}{2}$-inch or $\frac{3}{4}$-inch diameter piping. The percentage of solids is obtained by taking samples of the discharge at the end of the pipe.

The following observations have been found from previous experience to be generally correct.

The percentage of solids transported in a pipe-line decreases as the length of the pipe-line increases.

Material is transported in a pipe-line most efficiently at a velocity of about 12 feet per second.

The pressure is considerably greater when pumping sand and gravel than when pumping clay and loam, and the velocity of discharge is greater in the case of the latter.

The velocity of discharge decreases as the percentage of solids increases, but the increase in the percentage of solids more than compensates for the smaller discharge due to decreased velocity.

The vacuum always gives a higher reading, varying with the percentage of solids, than that obtained when pumping clear water.

When dredging and transporting a mixture of sand, shells, gravel, mud and stiff clay, the velocity of discharge in a pipe 2,000 feet long was found to vary from eight to 17 feet per second; and during these fluctuations the velocity decreased as the percentage of solids and the pressure, as indicated by the pressure gauge, increased.

A wide and continued variation in the vacuum also occurred when pumping solids, due apparently to the variations in the mixture of the materials.

The vacuum head in feet of water varied from 6 to 19.

Men experienced in handling suction dredgers are not easy to find, but we consider an intelligent man, seaman or engineer, with suitable Board of Trade certificates and of reasonably long sea service should very quickly learn to work the dredger efficiently, particularly under the general guidance of an experienced master like Mr. Spiers.

1. (*b*) The remarks clearly indicate that the assistant dredging master referred to was lacking in experience when compared with Mr. Spiers, but we hope his ability has improved and that he gives promise of efficient service.

2. (*a*) The material and the depths, averaging since week ended 18th December last from 20 feet to 30 feet, are considered to be ideal for suction cutter pump dredging and the very low output obtained is consequently very disappointing.

As it is not important that the finished bottom of the dredging should be level, the bottom two or three feet of stiff clay with murum and boulders should, if possible, be avoided wherever met with as it is apparently unsuitable and uneconomical for the dredger to deal with.

3. Where holding ground is bad it is a very common practice in dredging operations to back up an anchor which is gradually being brought " home " with another, usually single fluke anchor, the chain of which is payed out taut after making the end fast to the anchor to be backed up by the mooring lighter or anchor boat being towed by a launch in the direction in which the anchor is to be laid. The chain of the backing anchor should be of sufficient length to serve as a ground chain and to make sure that it will be taut when laid, it should be payed out under control of the lighter or anchor boat's crew.

When the ground is exceptionally bad, two backing anchors are laid out making an angle of about 20 degrees to 30 degrees with each other, at their connection with the anchor to be backed up.

As the output or efficiency of a suction dredger rapidly falls off after the designed length of discharge pipe is exceeded we are of opinion that the extra 781 feet of pipe between the dredger and the " Colaba " seriously affects the output and the better results would be obtained by exceeding the builder's limit of 5,000 feet as little as practicable.

We note that the difference in height of the discharge from the " Colaba " is about 22 feet at dead L.W.O.S.T., but as the builder's specification gives the height 16 feet, it is probable the 22 feet will not exceed the 16 feet limit which is measured from the centre of the pump to the centre (maximum level) of the discharge pipe.

If builder's limits are exceeded it is difficult to discuss question of output with them.

As a bonus on the output has not been arranged, we consider it should be arranged even at this late period of the season so as to give the men concerned the assurance that their better effort and skill in working the craft will be rewarded. We are strongly of opinion that the best output will not be obtained until a bonus is given and we therefore suggest that a start should be made at once with a reasonably substantial bonus to the dredging master (Mr. Spiers) and downwards. It is best to fix the bonus-earning limit low with a correspondingly low rate per unit and in this case might commence at 1,200 cubic yards per hour actual pumping or even a lower figure. The members of the crew concerned should at the same time be given to understand that the dredger and " Colaba " are capable of dredging clay and transporting it to reclamation at the rate of 2,000 cubic yards per hour.

It is an advantage to clear the discharge pipes during the operation of lifting the suction pipe and cutter at the close of the day's operation.

With regard to the " Kalu " there are several points on which we are not clear and we do not propose to write further on this matter until we have had an opportunity of seeing Mr. Brims.

Yours truly,

for C. S. MEIK & BUCHANAN,

(Sgd.) J. RISLEY SETTLE.

23rd July, 1925.

(Through the Director of Development.)

THE CHIEF ENGINEER,

Reclamations Branch,
Development Directorate,
Old Custom House Yard, Fort,
Bombay.

DEAR SIR,

Back Bay Reclamation.

Further to the correspondence *re* output of the *Sir George Lloyd* last season, we have had long conversations with Mr. Brims and have formed the opinion that the main causes of low output are the lack of incentive to the men in the form of a bonus on output, and also that there would appear to have been too much time spent on obtaining hard material at the expense of output, which we consider of greater importance.

We do not agree with the view stated on page 4, para. 2, of your letter 854 of 30th March last, that it is advisable to wait until the output is increased before fixing a bonus scale. We are of opinion that this should be done at the commencement of operations, the scale being based on the designed capacity of the craft, substantial bonus being earned when this is attained.

Yours truly,

(Signed) C. S. MEIK AND BUCHANAN.

No. 2349.

Development Directorate,
Back Bay Reclamation Scheme,
Chief Engineer's Office,
Old Custom House Yard, Fort, Bombay.
8th August, 1925.

MESSRS. C. S. MEIK & BUCHANAN,

16, Victoria Street, Westminster,
London, S.W.1.

DEAR SIRS,

In reply to yours of 23rd July, 1925, we are in agreement that a bonus will probably lead to an increase in the output, but I do not agree that the lack of this incentive is one

of the main causes of the low output, nor, do I agree that too much time has been spent on obtaining hard material by the *Sir George Lloyd* as all the material we can get from the area available will be required unless earth filling is resorted to.

I shall be glad to have your proposals of what bonus you would suggest, the scale being based on the designed capacity as mentioned in the last paragraph of your letter.

My idea is that a monthly bonus should be paid on *actual pumping time* only, exclusive of time spent in pumping water only, provided that measurements show that the quantity pumped is not less than say 900 cubic yards per hour.

The ordinary actual pumping time is reckoned to be 88 hours per week, when working double shifts.

Bonus to be paid, on the actual pumping time in excess of 80 hours per week in the following proportions :—

Sir George Lloyd & Colaba.	*Shares.*
4 Nos. 3rd Engineers at 1 share	4
4 ,, 2nd Engineers at $1\frac{1}{4}$ shares	5
2 ,, Chief Engineers at $1\frac{1}{2}$ shares	3
2 ,, Assistant Dredging Masters at $1\frac{1}{2}$ shares	3
1 ,, Dredging Master 2 shares	2
Total shares	17

If the bonus is fixed at, say, Rs.102 per hour, then the value of one share, Rs.102/17 = Rs.6, and the amount of bonus payable will be distributed as follows :—

	Bonus per hour.	
	Rs.	Rs.
4 3rd Engineers at	6.0.0	24.0.0
4 2nd ,, at	7.8.0	30.0.0
2 Chief Engineers at	9.0.0	18.0.0
2 Assistant Dredging Masters at	9.0.0	18.0.0
1 Dredging Master at	12.0.0	12.0.0
		Rs.102.0.0

Taking the output at 900 cubic yards per hour the output for 88 hours would be
$88 \times 900 = 79{,}200$ cubic yards.

Bonus on 8 hours at Rs.102 per hour = Rs.816.

$$\therefore \frac{816 \times 16 \times 12}{79{,}200} = 1{\cdot}98 \text{ pies per cubic yard additional cost.}$$

Yours faithfully,

H. A. ELGEE.
Chief Engineer.

Through the Director of Development.

16th September, 1925.

(Through the Director of Development.)

THE CHIEF ENGINEER,
Reclamations Branch, Development Directorate,
Old Custom House Yard,
Fort, Bombay, India.

DEAR SIR,

Back Bay Reclamation Scheme.—Dredging.

We duly received your No. 2349 of the 8-10th August, 1925, with regard to the proposed bonus to be paid on the output of the dredgers.

We note your suggestion that bonus should be paid on the *actual pumping time* and have given it our careful consideration. The idea is new to us and while we realise that a bonus on this basis would make for an increase in the number of hours' pumping (with reservations regarding the quantity of material pumped) we are of opinion that better results would be obtained by adopting the more usual system of bonus on the *actual quantity of material dredged per hour.*

We suggest that you should arrange a bonus based on a minimum figure of 800 to 1,000 cubic yards of material dredged per hour, as measured by soundings, for the " Sir George Lloyd," the actual amount depending to some extent on the nature of the material to be dredged. When the dredger is raising 2,000 cubic yards per hour the bonus to amount to 50 per cent. of the wages earned without bonus and between the minimum figure and 2,000 cubic yards a graduated scale to be prepared. All employees from the dredging superintendent downwards who can in any way influence the output to be put on the bonus list.

Assuming that the total wages bill is the same for an output of 1,000 or 2,000 cubic yards per hour, the cost of wages per cubic yard if and when the latter figure is reached would be 25 per cent. less, and fuel, stores and overhead charges would be reduced in greater proportion.

We suggest that you give this proposal your careful consideration.

Yours truly,

(Signed) C. S. MEIK & BUCHANAN.

(XIX.)

Letter dated 13th April, 1922, from Messrs. Meik & Buchanan to Director of Development.

SIR,

We have now had an opportunity of discussing with Sir George Buchanan the progress of the reclamation works at Back Bay, and we have also read his report to you, dated 17th February.

Whilst concurring generally with the report, we particularly desire to endorse and emphasise the paragraphs concerning engineering staff and engineering accounts; it is impossible to carry out efficiently a large public work without adequate engineering staff, and it is equally impossible to exercise economy without a proper system of cost accounting.

We also agree with Sir George Buchanan's programme of future operations and the suggestion for concentration contained in the latter portion of para. 41 of his report.

We had certainly hoped that the dredger would begin operations at the Colaba end during the next fair weather season, and we still think such a possibility should be kept in view.

The end tipping wagons will be despatched at the earliest possible date and if the railway between Marine Lines and Colaba is completed, and the cross wall built, even by hand labour, and the pipe line laid across the peninsula it might be possible, by beginning work at the end of August or early in September, to complete up to high water mark sufficient of the rubble mound, beyond the 2,000 feet of mass concrete wall, to justify the dredger working even for 2 or 3 months.

We received by the mail which arrived here on the 3rd April the Chief Engineer's letter, dated 17th March, enclosing an indent for the additional plant and machinery. Tenders are being taken in for the whole of the indent, but we have in our letter to the Chief Engineer, dated 11th April, 1922, questioned the necessity for some of the plant and have asked him to take your orders on the subject and cable a reply.

We have the honour to be, Sir,
Your obedient Servants,

(Sgd.) C. S. MEIK & BUCHANAN.

(XX.)

Testimonials and experience of Mr. Brims.

(Copy.)

28th March, 1923.

DEAR MR. HALCROW,

Herewith the other copies of my training and experience, which was not ready yesterday afternoon.

Yours sincerely,

(Sgd.) C. R. BRIMS.

(Copy.)

Outline of Training and Work Done by C. R. Brims.

1895-1900.

During this period I served my apprenticeship with Messrs. D. & C. Stevenson, civil engineers to the Northern Lighthouse Commissioners, Edinburgh, Scotland. While with this firm I was engaged in making surveys both land and marine, for lighthouses, river improvements, harbours, piers and new roads, and in the preparation of designs, working drawings, specifications and measurement of quantities for such work, and in the superintendence over the construction of same, also in preparing Parliamentary plans and estimates, &c. During this period I was also studying engineering at the Heriot Watt College.

1900-1902.

I left Messrs. Stevenson in December, 1899, and joined Messrs. S. Pearson & Son, Limited, Contractors, London.

I was engaged by them to take charge of the setting out, measuring up, and to superintend the construction of a storage reservoir, covering an area of about 80 acres, with a puddle wall and embankment, 8,800 feet long, also two overflows, a large aqueduct, and river diversion.

1902-1910.

I left Messrs. Pearson early in 1902, and joined Sir John Jackson, Limited, for their Simons Bay contract, Cape Colony, where I was employed until the end of December, 1910.

I was engaged by them to take charge of the setting out, measuring up, and to superintend the construction of the two breakwaters in connection with the new Admiralty Harbour Works, also certain other work in connection with the dry dock and permanent workshops.

The setting out and construction of the permanent railways and roadways, as well as our temporary railways, and 40- and 35-ton Titan roads, 40-ton Goliath roads, temporary jetty, and temporary stages and gantries for various machines.

1911-1912.

On the completion of the works at Simons Bay, I returned to London, and on calling at the offices of Sir John Jackson, Limited, in December, was asked to proceed at once to Ferrol, Spain, as chief engineering assistant. While there, I was engaged in setting out, measuring up, and superintending the construction of a dry dock, various buildings and roads in connection with same, the erection of ships, fitting out jetties, also the deepening of the tidal basin, by means of three bucket dredgers. I also had charge of all the repairs and maintenance of the various marine craft.

1912-1919.

On the completion of these works, I returned to England, and joined Messrs. Topham, Jones & Railton, Limited, Contractors, London. I was engaged by them as chief engineering assistant on a contract in Wales for three months, when I was sent north to take charge of the engineering side of the contract they had secured for the dredging of the approach channels to H.M. Dockyard, Rosyth, Scotland, acting also as assistant manager. This position I occupied until January, 1918, during which time we carried out several very urgent war works for the Admiralty.

In January, 1918, I was appointed Assistant Manager to take charge of an urgent dredging contract at Inverness. This work I completed by the end of May, 1918, when I was appointed Local Manager, in charge of the construction of two haul-up Slipways and two Piers which Messrs. Topham, Jones & Railton, Ltd., undertook to construct at H.M. Dockyard, Pembroke Dock, on behalf of the Admiralty.

1920-1921.

The above works were completed at the end of 1919, when I was appointed Manager in charge of the constructional work for a large Oil Storage Installation which Messrs. Topham, Jones & Railton undertook on behalf of the British Petroleum Co., Ltd., at Salt End, Hull.

1921-1923.

On completion of our section of the work at Hull, I joined the staff of the British Petroleum Co., Ltd., to take charge of and superintend the constructional work at nine large Oil Storage Installations, and later other work of a similar nature throughout England and Ireland.

(Signed) C. R. BRIMS.

27th March, 1923.

MESSRS. C. S. MEIK & BUCHANAN,
16, Victoria Street, S.W.1.

DEAR SIRS,

Bombay Reclamation Scheme.

With reference to your conversation with me regarding an Engineer to take charge of and supervise the above work, and in confirmation of my verbal statement that I would be willing to consider same, I now have pleasure in sending you particulars of my general training and experience, together with particulars of the various dredging works supervised by me.

I shall be pleased to receive in due course full particulars of conditions of engagement, and should my application be favourably considered could arrange to sail within three months of notification.

Thanking you for recommending me to the authorities at Bombay.

Yours faithfully,

(Sgd.) C. R. BRIMS.

Outline of Dredging Work Superintended by C. R. Brims.

NOTE.—As all the dredging work I have been engaged upon has been carried out on behalf of the Admiralty it is impossible for me to give details of same. The following brief outline of the various works will I think, however, be sufficient to indicate that I have had extensive experience of this class of work, extending as it does over a period of 18 years.

At Simons Bay, South Africa, 1902-1910.

This consisted of two distinct sections of work, but for both sections a self-propelling hopper suction dredger capable of dredging to a depth of 30 feet was employed.

The first section consisted of dredging wide trenches to a uniform depth for the rubble foundations of a breakwater and two basin walls. The material dredged from these trenches was pumped into the hoppers of the dredger and deposited at sea.

The second section consisted of dredging a tidal basin of 28½ acres to a depth of 30 feet below low water of ordinary spring tides. Part of this material was taken to sea, but a large proportion was pumped ashore for reclamation purposes. The longest length of pipe line used for this was about 1,000 feet. The method adopted was as follows :—

A temporary skeleton jetty for berthing the dredger was constructed against one of the breakwaters, a pipe line was then laid from this jetty across the breakwater to the inside of same. The end of this pipe line, which overhung the inner slope of the breakwater, was supported by means of a simple light timber frame. Owing to the suitability of sand for reclamation by pumping, it was possible after a time to support the end of the line when extended by simply laying old railway sleepers on the sand previously pumped ashore.

All the material dredged was pumped into the hoppers of the dredger. The dredger then went alongside the temporary jetty, and after having the delivery pipe connected to the line on shore, the material in the hoppers was pumped ashore by means of the dredger's own pump.

At Ferrol, Spain, 1910-1911.

This consisted of the deepening of the existing tidal basin to a depth of 8½ metres below low water of ordinary spring tides by means of three bucket dredgers, the dredged material which consisted of silt, hard clay and rock being taken to sea in hopper barges.

Owing to the restrictions imposed by the authorities, blasting of the rock was not possible. The dredging of this was therefore a very slow and arduous task and

necessitated one of the dredgers being a heavy rock dredger. The other two which were much lighter craft were concentrated on the softer material.

The craft used for conveying the dredged material to sea were two steam hoppers, four dumb hoppers and two ocean-going tugboats for towing the latter. The total quantity dredged was about 800,000 cubic metres.

At Rosyth, Scotland, 1913-1918.

The work here comprised several dredging contracts, the two largest being the formation of the approach channel to the Naval Base (this was dredged to a depth of 30 feet below low water of ordinary spring tides) and the removal of a large bank in the middle of the River Forth, which was also dredged to a depth of 30 feet below low water of ordinary spring tides. The total quantity dredged in each case amounted to approximately eight million cubic yards. The material consisted of silt, soft clay, hard-bound gravel and boulder clay in the former case and soft silt and sand in the latter case.

Work was carried on continuously in two shifts of twelve hours each, five and a half days per week.

The craft employed were three bucket dredgers, six steam hoppers, two tugboats and several small craft.

The record output for one dredger on this work amounted to 73,500 barge cubic yards in one week of 11 shift.

All of the various dredging works here were completed within contract time, the approach channel to the Naval Base being completed as much as 12 months under the contract time.

At Inverness, Scotland, June-May, 1918.

The work here consisted of dredging channels through two banks in the fairway in the Inverness Firth. The material in one bank was composed of gravel and in the other all mud and silt. In the former case we had at times to contend with a six or seven knot tide. We therefore employed a heavy rock dredger on this bank. On the other bank, where the material was mud and silt, one self-propelling and one stationary dredger was employed.

All the material dredged was conveyed to sea in steam hoppers.

The craft employed consisted of three bucket dredgers, eight steam hoppers, two tug boats, one self-propelling coaling lighter, one motor-driven water boat, and three small launches.

At Pembroke Dock, Wales, 1918-1920.

The dredging work here consisted of the removal of the mud overlaying the rock on the site of two jetties and two haul-up slipways, and also the lowering of a mud bank opposite the two jetties.

The removal of the mud overlaying the rock was a very difficult operation owing to the impossibility of obtaining a suction dredger at the time. We therefore used a heavy rock dredger.

Owing to the uneven surface of the rock the buckets frequently caught in obstructions, stopping them revolving and throwing great strain on the buckets, links and pins. The conditions were severe and repairs consequently heavy Had it been possible to obtain a suction dredger at the time, the cost would have been considerably less and the time required for completion much shorter than it was.

The craft employed on the dredging work here consisted of one self-propelling rock dredger, fitted with buckets for dredging soft material, three steam hopper barges, one sea-going tugboat, and one small self-propelling steam water boat.

The work was proceeded with day and night in twelve-hour shifts, five and a-half days a week, but owing to the high level at which the rock was found over a large area of the site it was necessary to work tide work during a portion of the time.

During a gale immediately after the completion of the construction of the jetties and slipways, the water boat dragged her moorings, grounded on the side of a bank on the falling tide, and slid off on her side, going down in about 20 feet of water. The work of salving this vessel was carried out under my supervision, and was so successful that the hull was not damaged in any way by the lifting operations.

16, Victoria Street,
Westminster, S.W.1.
11th April, 1922.

My dear Hepper,

I am much distressed to receive a letter from Lewis by this mail written from St. George's Hospital and I wonder if you are taking any action on the lines I suggested to His Excellency and to yourself. Possibly as his leave is nearly due you are letting him carry on to that date especially as it would be difficult for him to get a steamer passage by an earlier boat. On the other hand if you had Lewis examined by a Medical Board before he leaves India and they reported unfavourably he would not be able to return to India from leave without a clean bill of health. We feel very strongly that in the interests of the work there should be no chance of a repetition of this disastrous year of sickness.

We received by last mail an indent for additional machinery and rolling stock for the Back Bay Scheme aggregating in value over £90,000. We have written by this mail to Lewis challenging several of the items and we have asked him to discuss the matter with you and send us a cablegram with final orders.

We have pointed out that we have no wish to interfere with the discretion of the man on the spot or in any way to delay the work but that in the interests of economy we think his estimate might be cut down.

With kind regards,

Yours sincerely,

(Signed) GEO. C. BUCHANAN.

3rd June, 1922.

My dear Hepper,

I received this mail your letter dated 8th May, saying that you had postponed your "leave" and would not sail from Bombay until 8th July.

On the assumption that you were sailing for home on the 20th May, we were looking forward to a long talk with you on the subject of the Back Bay Reclamation Scheme, because we are seriously concerned about the lack of information we are receiving from the Chief Engineer, or as he is called in our agreement, the Resident Engineer. As you will now be at Bombay for another month we think it well to put the matter in writing and we have this mail written a letter to the Resident Engineer of which we enclose you a copy demi-officially.

Our agreement is very plain and we feel sure that you and the Government of Bombay are as anxious as we are that we should conform to that agreement and carry out conscientiously and thoroughly the duties laid down therein.

At present there appears to be a tendency on the part of Lewis to keep us in the dark and use us merely as agents for the purchase of plant.

If the works were being carried out by contract there would be no question as to the procedure; the Resident Engineer would receive his instructions from us and it would be his business to see that the contractor carried out the work accordingly.

As the work is being done departmentally the case is a little different; the Resident Engineer is taking the part of the Contractor and must so far as the execution of the work is concerned be permitted to exercise his own judgment but that need not hinder our supervision as responsible Engineers, or prevent our being kept fully acquainted with the progress and the cost of the work.

In all works of magnitude such as that in the Back Bay a complete record of progress comprising plans, photographs, and statements ought to be kept and if this is so there should be little difficulty in forwarding us copies periodically.

There can be little doubt that Lewis' health has broken down seriously and in the opinion of Mr. Meik and myself you would do well to have him examined at home by a Medical Board for an expression of opinion as to his fitness to continue hard work in the East.

But this and other points we can discuss on your arrival home towards the end of July.

Yours sincerely,
GEO. C. BUCHANAN.

Sir LAWLESS HEPPER,
Bombay.

II.—SUMMARY OF THE PREVIOUS HISTORY OF THE BACK BAY RECLAMATION SCHEME SUPPLIED BY THE GOVERNMENT OF BOMBAY.

The following is an outline of the history of the Back Bay Reclamation Scheme.

1. In the year 1863 the Government of Bombay (Sir Bartle Frere being Governor) submitted to the Government of India proposals for the reclamation, by a company, of 1,500 acres of the foreshore of Back Bay. In January 1864 this proposal was sanctioned by the Government of India. Later in the same year the Government of Bombay requested sanction to invest 40 lakhs in the company, the total share capital of which was Rs. 200 lakhs. The Government of India refused to agree to this proposal, their main objection being that there was not sufficient information before them to enable them to estimate the risks. The reclamation was, therefore, commenced without Government assistance, but the cost of the work proved to be greater than had been anticipated. The failure of the Asiatic Banking Corporation in which the company had deposited 90 lakhs proved a further source of embarrassment. The company had, therefore, to be wound up in the year 1866.

2. Nothing further was done in the matter until 1887 when Lord Reay's Government appointed a committee to prepare a comprehensive scheme for the future extension of the city. The committee again advanced the reclamation of Back Bay as a means of providing to some extent for the expansion anticipated. No action was taken on the committee's report until 1897, when the subject was revived by the Government of Lord Sandhurst. Another committee was appointed during that year, and as a result of its recommendations the City Improvement Trust was constituted. This committee laid stress on the desirability of reclamation along the west side of Colaba point, and in consequence 90,000 square yards were reclaimed by the Trust as a tentative measure; and the result proved to be satisfactory and profitable.

3. In 1907 Lord Lamington's Government appointed a committee to consider a rough reclamation scheme which had been prepared in the Secretariat for an area of 973 acres at a cost of Rs. 176 lakhs. The committee's recommendations increased the cost to Rs. 320 lakhs, which was later reduced to Rs. 284½ lakhs. No action appears to have been taken on this report at the time.

In January 1911 the Government of Bombay submitted proposals for reclamation for the general approval of the Government of India. Two schemes were submitted: one for the above-mentioned area of 973 acres; and one for 1,272 acres at a cost of Rs. 388 lakhs. The project actually advocated by the Government of Bombay was for the reclamation of 1,100 acres, for which no estimate had been prepared.

4. In submitting this scheme the Government of Bombay recommended that it should be undertaken by Government, but omitted to state whether the provincial or Imperial Government, or both jointly, were implied. The Government of India asked the local Government to consider whether the work could not be carried out, under Government control, by some outside agency, *e.g.*, a syndicate, the municipal Corporation, or Improvement Trust, with assistance from provincial revenues, or by a Reclamation Trust created *ad hoc*. In reply the Government of Lord Sydenham urged that the scheme was a productive public work of the highest utility and deprecated the idea of its being taken up by an outside agency, for the reason that interests vitally affecting the City of Bombay would be subordinated to the ends of that outside agency. The idea of making over the work to the Municipal Corporation or to a local Trust was also dismissed on the grounds that the rate of interest payable would be higher than that at which Government could borrow; that this difference would reduce the ultimate profit without conferring any benefit on the State; and that neither the Corporation nor the Improvement Trust could be saddled with a work of such magnitude in addition to their ordinary duties. In the circumstances the local Government urged that the work should be undertaken on the financial responsibility of Government, the Imperial Government to raise the loans and to place them at the disposal of the local Government.

5. The Government of India considered that the operations of the Improvement Trust and the reclamation might be mutually destructive. They also doubted whether the local Government had sufficiently examined the possibility of the extension of the city in other directions. For these and other reasons the Government of Lord Hardinge hesitated to accord their approval to the scheme. An informal arrangement was, however, made with the Government of Bombay under which it was agreed that a strong and fully representative committee was to be convoked to consider the future development of Bombay City. It was also informally agreed that, should it eventually be decided, as a result of the committee's deliberations, that a scheme of reclamation in Back Bay was desirable, a beginning might be made in this direction on a small piece of 84 acres. At the same time the Government of Bombay was informed that there

was no objection to a complete survey and estimate being prepared by Mr. Kidd, of Messrs. Lowther, Kidd & Co., and the scheme investigated in detail and the financial aspect discussed.

6. In January, 1912, the Government of Bombay forwarded to the Government of India Messrs. Lowther, Kidd & Co.'s terms for investigating the scheme. In February, 1912, the Government of India sanctioned by telegram an expenditure of Rs. 1,57,500 on the investigations and preparation of estimates, etc., by Messrs. Lowther, Kidd & Co. The Government of Bombay then forwarded the estimates prepared by the firm for reclaiming about 1,145 acres in Back Bay and 124 acres on the east side of Colaba for Military purposes, the amounts being 325 lakhs and 37 lakhs respectively. With a view to strengthen their position in urging sanction upon the Government of India, the Government of Bombay appointed in November, 1912, under the presidentship of Sir Vithaldas D. Thackersey an unofficial committee of Bombay citizens to advise Government on certain points having an important bearing on the scheme. The committee's recommendations were as follows :—

> "We are convinced that, unless some means are found to provide extra dwelling accommodation in the Southern portion of the Island near the business quarters, the overcrowding in the city proper will continue to increase with the inevitable result of forcing up rents still more. Such a contingency would no doubt benefit the landlords, but it would mean a great hardship to the general public who pay rents. If the reclamation is practicable, as we believe it to be, it should be undertaken immediately in order to prevent the possibility of such a contingency arising The strongest point in favour of the Reclamation being taken up immediately is that Government will be able to provide a large area of land for residential purposes near the business quarters at a reasonable rate without appreciably affecting existing interests. In recent years the shop rents in the Fort have enormously increased and the demand for shop area is augmenting yearly. The burden of this continuously increasing rent cannot but affect the general public who must pay the same in the increased prices for goods. The schemes undertaken by the Improvement Trust in the North of the Island or the development of Salsette cannot meet this difficulty. If the insanitary condition of the north part of the Fort is to be improved by partial demolition of the buildings to give sufficient air and light to the remaining properties, it can be made feasible only by the extra supply of land near the Fort, which supply the proposed reclamation will provide.
>
> "In conclusion, we wish to lay stress on the fact that the scheme is not only financially sound, but that it adds to the beauty of the city, and will, after some years, add considerably to the resources at the disposal of the Improvement Trust in its efforts to reclaim insanitary areas."

That report was forwarded to the Government of India and it was urged upon them that sanction may be accorded to the scheme being carried out by the local Government. In September, 1913, a letter was sent to the Government of India stating that a further communication would be sent in the matter and that further consideration might be held up meantime.

7. The committee informally suggested by the Government of India and referred to in paragraph 5 above sat in the cold weather of 1913-14. In their report, after discussing the subject at length with due regard to the prospective developments of Bombay in other directions also, the Committee finally recommended that Government should confine itself to reclaiming a small area of about 100 acres for the expansion of existing public (and especially educational) institutions. Their recommendation was framed with two objects in view, firstly, to make available, purely for Government purposes, an additional area urgently required in the neighbourhood of the Fort, and, secondly, to provide a reliable check on the correctness or otherwise of the estimates upon which the wider scheme was based. They further stated : "When that is definitely known it is conceivable that further reclamation for the provision of space for residence might be regarded as practicable and even desirable." Copies of this report were sent to the Government of India on 5th June, 1914. Subsequently, in 1916, the Government of Bombay submitted an estimate for the reclamation of 220 acres of Back Bay. Mr. Kidd's estimate of the cost of this work amounted to Rs. 84 lakhs, and he assumed a period of construction of four and half years ; the Government of Bombay revised these figures to 124 lakhs and eight years respectively, and further stated that they were prepared to finance the work from provincial revenues. The Government of India, however, found themselves unable to accept the scheme as submitted, as they were doubtful whether the Government of Bombay were actually in a position to undertake to finance the scheme, and the project was returned to the Government of Bombay with the intimation that, should they desire to proceed with the more modest scheme proposed by the Development Committee of 1913-14, and be able to satisfy the Government of India that the cost could be met from provincial resources, the Government of India were prepared to give such a scheme their most careful consideration and, should it be sanctioned and prove financially successful, the profits accruing could

be applied to its further extension. This was in February, 1917, and owing to the war the matter remained pending.

8. In December, 1917, a syndicate was formed comprising the Honourable Mr. Lallubhai Samaldas, Sir V. D. Thakersey, Sir Sassoon David, and Sir Fazalbhoy Currimbhoy who addressed the Government of Bombay on the subject of the Back Bay Reclamation Scheme, and asked for a concession as they proposed to float a company with the necessary capital. On the 19th of December of the same year Messrs. Tata Sons, Ltd., addressed the Government of Bombay as to the terms on which Government would be prepared to entrust the work to a private Corporation, and asked for an option on the scheme for twelve months. Subsequently, the two syndicates combined and on 15th January, 1918, their representatives interviewed the Honourable Mr. G. Carmichael, who was, at the time, Finance Member in a Government composed of :—

His Excellency the Right Honourable Lord Willingdon, Governor,
The Honourable Mr. G. Carmichael,
The Honourable Mr. G. Curtis,
The Honourable Sir Ibrahim Rahimtoola.

On the 28th April, 1918, the following note summarising the position in respect to the Syndicate, was written by the Honourable Mr. (now Sir) G. Carmichael :—

" *Back Bay Scheme.*—The two interests which applied for an option of the reclamation concession have combined and I understand their interests are to be divided as follows :—

Sir Sassoon David		
Sir Shapurji Broacha		
Sir Fazalbhoy Currimbhoy	$\frac{1}{2}$	
Sir Vithaldas Thakersey		
Mr. Lallubhai Samaldas		
Messrs. Tata & Co.	$\frac{1}{2}$	
Tata's Industrial Bank		

" The sharers to be jointly and severally liable within their half shares and the partners in the two half shares to be jointly and severally liable for the whole.

" 2. They contemplate forming a syndicate with 20 lakhs paid up capital to make the further investigation which is necessary, to work out the method of financing the scheme, and to arrange for promoting the Company.

" 3. As regards Tata's Industrial Bank getting support from Lloyd's Bank, apparently it is a syndicate in London with whom negotiations are going on. I understand that the basis on which the syndicate will come in has not yet been settled. If it is settled satisfactorily then the Bank would probably have a strong board; which was one of the points on which the Honourable Mr. Curtis entertained some doubts.

" 4. The applicants at first entered into negotiations with Messrs. Lowther and Griffiths, but these have been finally broken off and they are now in treaty with the firm of Coode, Mathews, Fitzmaurice & Wilson, of which the head partner is said to be Maurice Fitzmaurice, at present Controller of Canals in the United Kingdom. The head of the firm might, it is said, be able to come out to India if he were relieved of his post at home, but this could not be before Christmas. In the meantime Messrs. Tata & Co. wish to ask the firm to send out a younger man to start investigation before the monsoon.

" 5. Colonel Grisewood, on behalf of Messrs. Lowther and Griffiths, has entered a protest against the way in which that firm have been treated by Messrs. Tata & Co., and at the same time applies for a concession on behalf of his principals. He indicates three lines on which they would be willing to negotiate. These all depend on Government ultimately finding the money, though under the third proposal the firm would take part payment in the shape of a long lease (say for 60 to 75 years; the figure is not mentioned but I understand this is roughly what is intended) of part of the reclaimed area. There are men of sound judgment in Bombay who think that it would be a profitable scheme for Government to take up soon after the war is over. But there would be a strong body of opinion the other way, and there is no doubt in my mind that if we wish to avoid delay we should leave the project to private enterprise. Government will after the war have many more urgent claims on their revenue or loan funds.

" 6. If this is agreed to, then we should, I think, give the option to the first applicants. In any case it should go to an Indian Company in the end, and with the original applicants against them Messrs. Lowther and Griffiths could not form a Company in Bombay, even if they proposed to do so, which they apparently do not.

" 7. If the option is given to Messrs. Tata & Co. and their syndicate we should not dictate their choice of the engineers whom they may employ. All we need see to is that they do employ a firm of established repute in this line of work.

" 8. As far as I can see, if Government do not undertake the work themselves they are not under any obligation, legal or otherwise to Messrs. Lowther and Griffiths. For the work which they did they were paid.

" 9. Nor are we concerned with the reasons why the negotiations between Messrs. Tata & Co. and Messrs. Lowther and Griffiths failed.

" 10. I presume that before granting the option asked for we should indicate conditions. The reclamation rights of the Improvement Trust expire in September, 1918, and there is no difficulty on this point. It is possible, however, that legislation will be necessary to obtain the right of laying the pipes across private lands and Municipal lands between the dredgers in the harbour and the reclamation area.

" 11. As regards conditions, the points which occur to me are—

(*a*) Approval of the Engineer or Engineering firm employed.

(*b*) Approval of the design of the scheme.

(*c*) Government to be satisfied that the finances are sufficient before the scheme is commenced.

(*d*) Government to have an option to take over at cost price an area not exceeding a certain maximum.

(*e*) An area of 100 acres to be provided for a public park free of charge the Municipality to have an option to add a further area to the park, subject to a maximum, say, of 50 acres more, by purchase at cost price.

(*f*) The area of 124 acres on the east of the island to be reclaimed on behalf of Government at a contract price.

(*g*) The layout to be approved by Government.

(*h*) The Company to bear the burden of any possible claims on account of damage caused by the reclamation to the amenities, etc., of existing properties.

" 12. As regards (*d*) above, the origninal idea was to reserve 40 acres for Government house. I do not think this was a sound idea as the land at the point will not be very high above high water. We have, however, to provide for many other public buildings. It is also a question whether we should not retain an option on land which Government could give out on lease.

" 13. The question will have to be examined whether higher sanction is needed before giving the concession."

This note was circulated to the Governor in Council and finally the Government of Bombay decided to obtain a report on the scheme by an independent expert.

In accordance with this decision, a telegram was sent to the Secretary of State for India by the Government of Bombay on the 16th October, 1918, stating :—

" Government of Bombay consider a re-examination of the Back Bay Reclamation Scheme a matter of special urgency, and hence shall be obliged if best qualified man available is chosen and sent to Bombay for that purpose. He should know recent work of the same kind and latest mechanical devices and be entirely independent of Lowther, Griffiths, and Tata Syndicate."

Shortly after Sir George Lloyd succeeded Lord Willingdon as Governor of Bombay on 16th December, 1918.

No reply having been received from the Secretary of State a further telegram was sent to him on 8th April, 1919, stating :—

" *Back Bay Reclamation Scheme.*—Government of India had asked you to send out best expert available to examine and make final report on above. Government of India had also asked us to send all plans to Delhi for transmission to you in order that expert may study them before departure."

" (1) I think this procedure involved unnecessary delay in view of the fact that expert must be here to see conditions just before monsoon breaks as well as after it.

" (2) I have consulted Government of India, and Sir Claude Hill concurs with me in proposing you should send expert out at once to arrive Bombay not later than third week of May.

" (3) All plans and information essential to experts' study now here.

" (4) Lord Sydenham or W. L. Cameron, late Chief Engineer, Bombay, would advise regarding choice of expert.

" (5) Failing your ability to find expert in short time available, my Government would agree to using Sir George Buchanan whose services would probably be available and whom the Governmenat of India recommend.

" (6) My telegram has been drafted in consultation with the Government of India and is being communicated to them.

" (7) Please telegraph immediately whether expert can be found in time to arrive by middle of May or whether we should proceed with Buchanan."

To this, the Secretary of State replied on the 25th April, 1919, stating—

" Sydenham suggests appointment of Cameron as expert and doubts whether it is possible to send a new man out in May. I have not sounded Cameron. I probably could secure Frederick Palmer of Randell Palmer and Tritton, if you would wait for him till October. He was for nine years Chief Engineer for Calcutta Port Trust, and then Chief Engineer to Port of London Authority. His firm is not interested in concession is closely connected with India Office and of highest standing. What are your views? Is it essential that the expert if he has already the knowledge of monsoon effects should be present throughout entire period of monsoon? Any such condition is deterrent."

A telegram expediting reply to the telegram of 25th April was sent on 16th May, 1919, and on receipt of this telegram, another telegram was sent by this Government to the Secretary of State on 26th May, 1919, stating :—

" Your telegram, dated 16th May. Reply to this was postponed in view of impending discussion with Sir Claude Hill, and his return to England. My Government were opposed to employment of Cameron, and in view of difficulty of getting Palmer out before October, decided to employ Sir George Buchanan, who is at present engaged upon the work and will probably, after concluding preliminary investigation, proceed home to make further inquiries regarding dredging plant and material."

9. On the 30th May, 1919, Sir George Buchanan was asked to prepare a report, the terms of reference being :—

" (1) To examine and report on the scheme prepared by Mr. Kidd of Messrs. Lowther, Kidd and Company, for the Reclamation of 1,145 acres in Back Bay, Bombay (known as the 1912 project) or any portion thereof which Government may hereafter designate. The Scheme comprises :—

(*a*) the construction of a sea-wall.

(*b*) filling-in within the area enclosed by the sea-wall by means of dredging in the harbour on the east side of the Colaba Peninsula, and pumping the material across the narrow neck at various points in the Back Bay;

(*c*) Covering with a layer of moorum the land so reclaimed.

" (2) A specific opinion is required on the following points :—

(i) the practicability of the scheme from the engineering point of view;

(ii) the suitability of the type of wall proposed or alternate suggestions for better types;

(iii) the suitability of the proposed method of reclamation by means of dredging, or alternative proposals for same.

" (3) Mr. Kidd, in his project of 1912, gave a general estimate for the above but unaccompanied by details of cost of dredgers and other plant. A revised estimate is required for the whole of the scheme giving details showing :—

(*a*) cost of dredging plant,

(*b*) cost of dredging,

(*c*) cost of sea-wall, along with the price of plant in connection with with the same,

(*d*) cost of moorum filling and plant required.

" (4) A programme of construction is required along with an opinion as to the order in which the work should be executed, and the time within which the various sections could be completed from the date of the order to begin the work.

" The question whether the entire work should be given out as one complete contract or divided up into a number of small contracts may also be considered, and whether it might not be advisable to carry out some items of the project, or even the whole of it, departmentally.

" (5) A separate report and estimate on above lines is required for the reclamation of the east of the Peninsula from Pilot Pier to Sassoon Dock, known as the East Colaba Project, and an opinion as to whether it could be carried out by dredging plant already in Bombay."

Asking for sanction to the Scheme.

10. Sir George Buchanan accordingly prepared his report in September, 1919, and submitted it to Government in October, 1919. On receipt of the report, the Government of India were addressed under this Government letter No. 10550, dated the 4th December, 1919, stating :—

" Sir George Buchanan has now presented his report and I am to say that this Government understands that the Government of India are prepared to accord administrative approval. The Governor in Council does not consider it necessary to discuss the 1912 project again. As pointed out by Sir George Buchanan in paragraph 28 of his report, Messrs. Lowther and Kidd's plans reveal such an unusual absence of detail that it makes examination of figures extremely difficult

from a technical point of view. In the circumstances, the Governor in Council proposes to discard this scheme entirely and to concentrate attention solely upon Sir George Buchanan's own scheme, which includes the same area as that covered by the 1912 project, viz., 1,145 acres.

" 4. On the technical aspect of the new scheme, the Governor in Council offers no opinion. He is fully prepared to accept Sir George Buchanan's carefully considered views on the practicability of the scheme from an engineering point of view, on the type of wall required for the reclamation and on the method of reclamation.

" The Governor in Council is confident that the Government of India will have little hesitation in accepting Sir George Buchanan's opinion, in view of the fact that opportunity has been afforded to your Department to discuss all technical details with Sir George Buchanan himself. I am to add that the Governor in Council is prepared in view of a possible increase of rates for labour or materials to add 10 per cent. to the total of the scheme as estimated by Sir George Buchanan, and the total cost of the project may be roughly taken at Rs. 4 crores for the purposes of finance.

" 5. Taking the area to be reclaimed at 1,145 acres, the cost of reclamation and equipment works out under the present scheme at Rs. 6·63 per square yard. Assuming, however, that of the total area reclaimed 400 acres are required for roads and parks, the net area available for building is 745 acres, so that, if the charge for the whole scheme is debited against this area, the net cost per square yard works out at Rs. 10·19. The whole of the area, however, will not be available for sale or lease to the public. A considerable portion must be reserved for Government building, but I am to say that there is no present intention of reserving any portion of this area for a new Government House as was originally suggested. How much will be so reserved cannot be stated at this stage, but assuming for the sake of argument that as much as one-half of the area available for building will be required for Government purposes, which is of course an extremely outside figure, the net cost of the whole scheme per square yard of area available for sale or lease to the public works out at Rs. 20·38 only. If interest charges are included this figure might be raised, however, to Rs. 30. The saleable value of this area is necessarily a matter of conjecture, but some guide to it can be discovered from the prices at which land in the adjacent business area of Bombay is now changing hands. Sales of such land at prices ranging from Rs. 300 to Rs. 500 per square yard are of common occurrence. As much as Rs. 1,000 per square yard have recently been paid for land in the Fort and a case is known in which Rs. 1,200 per square yard were actually offered and refused. It is not of course anticipated that the average price of the saleable area will reach anything like so high a figure, but the Government in Council is confident that the most conservative estimate an all-over price of Rs. 100 per square yard can safely be relied upon, against an estimated cost of Rs. 20·38, or with interest charges Rs. 30. Allowing therefore for the largest possible margin of error both in the estimated cost of reclamation and the estimated value of the area available for sale or lease, and without taking into consideration the fact that, should all or several of the Government buildings in the Fort area be tranferred to the reclamation, and the sites on which they stand be sold together with the buildings themselves, which would realise an enormous sum, it is evident that the proposed scheme will be immensely profitable to Government. In these circumstances the Governor in Council trusts that the Government of India will have no hesitation in moving the Secretary of State to accord his sanction with the least possible delay. Meanwhile it is of first importance that the scheme should be accepted by the Government of India and sanction given by them to the purchase of dredging plant in anticipation of the Secretary of State's sanction of the whole scheme. It is understood that there is a precedent for this procedure.

" 6. * * * * * *

" 7. Finally, I am to say that the scheme forms only a part of a very large programme of development which this Government propose to undertake in the immediate future, and the question of financing all these local schemes has been the subject of a recent discussion at Delhi. In accordance with the decision then arrived at, this Government will shortly address the Government of India again on the subject of raising locally the funds required for the project under consideration, and on the further question of financing in each year, in consultation with the Imperial Government, the other important projects now under contemplation. It is only necessary here to state that the Governor in Council understands that the Government of India have appreciated the importance of these housing and development schemes, and have decided to accord their full support of these projects, leaving the question of financing the necessary loans by Provincial or Imperial borrowing to be decided in accordance with the circumstances obtaining in each

year. I am to ask that telegraphic intimation may be given as regards the immediate sanction required to the proposed purchase of the dredging plant, as the offer quoted by Sir George Buchanan is only open for a very short period longer."

Secretary of State's sanction to the Scheme.

11. A further letter was sent to the Government of India on 4th February, 1920, setting out in detail the various development schemes including the Back Bay Reclamation Scheme, and the executive authority which would carry out *inter alia* the Back Bay Reclamation Scheme, and the mode in which the scheme was to be financed along with the other development schemes. The Secretary of State gave his approval to the scheme outlined in previous letters in his telegram dated 4th May, 1920, stating " I desire to acknowledge the admirable work of the Government of Bombay in devising scheme, which is conceived on bold lines, and subject to suitable scheme of finance being evolved, I am prepared to accept proposals in principle." The final sanction to the proposed taxation and to a draft bill was received in June, 1920.

Introduction of the Bill for the Amendment of the Acts in the Legislative Council.

12. As a result of the above sanction a bill to amend the City of Bombay Improvement Act, 1898, and the City of Bombay Municipal Act, 1888, was introduced in the Local Legislative Council in August, 1920. In his speech introducing the bill His Excellency Sir (now Baron) George Lloyd referred in the following terms to the Back Bay Reclamation Scheme, and the mode in which it was proposed to carry it out along with the housing and other Development Schemes :—

" Briefly, then, the Directorate will (*a*) carry out with the assistance of its engineering staff the Back Bay Reclamation Scheme and any other reclamation schemes which may be found necessary in or near Bombay City.

" (*b*) It will undertake the whole of the industrial housing scheme.

" (*c*) It willl organise systematically the supply of building materials for its own work and of those works with which it is connected. One of the main reasons for the inadequacy of housing for the present day, as I have already mentioned, is the high cost of materials. It seems to us unlikely that the shortage of housing will be made good unless the State steps in and enables private individuals and companies to build more cheaply than they can to-day.

" (*d*) It will take over from the existing Secretariat all questions relating to the acquisition of land in the city of Bombay and all questions regarding the utilization of Government land. It will be consulted with regard to all proposals affecting land in Bombay City which are submitted by local bodies and railway companies. I wish here to emphasize the fact clearly that the Directorate will not have any powers whatever of interference with existing local bodies other than those which Government at present has. It will merely do on a wider scale and in a more efficient manner what Government has already been doing, or I should rather say, what Government would have wished to do but which for lack of personnel and organization it has not been able to do when confronted with such large and imperative reforms. We wish particularly to avoid creating any new authority; we wished our own authority, however, to be as effective, expeditious and prompt as we could make it in view of the immense task ahead of us. Its success must, therefore, depend largely on personal influence and on the public experience of its utility, inasmuch as it has no new powers of interference of any sort.

" (*e*) It will carry out large schemes for the systematic development of Salsette. This can be effected in two ways: (1) by town planning schemes to be carried out by local authorities and (2) by the purchase of areas outright with a view to re-sale after development with the least possible cost.

" (*f*) It will secure an adequate water supply for the whole of Salsette when it is developed as an urban area. Provisional arrangements for the immediate future have been made with the Bombay Municipality, but it is probable, when the area is developed, this will be inadequate. If this is so, an alternative supply must be obtained.

" (*g*) The Directorate will do its best to deal with the supply and distribution of the electrical energy in the area outside Bombay. Transmission lines of one of Messrs. Tata Hydro-Electric schemes run across Trombay, while those of another are being erected towards the east of Salsette. A central authority will be useful for the control of the supply of both for domestic and industrial purposes.

" (*h*) The Directorate will also take over the improvement of communications with Salsette. The question of improving railway communication with Trombay is already under discussion with the G. I. P. Railway, but that of linking up with Bombay City large areas in Salsette which are so admirably suited for

residential purposes but are practically without communications remains to be considered and grappled with.

" (*i*) The Directorate will co-operate with the Port Trust in the Development of the Bombay port, more particularly if the scheme is ultimately adopted, in the development of a new dock area and ship-building area on west Trombay. A proposal to transfer to this area the Royal Indian Marine Dockyard is also under consideration."

None of the members of the Council criticised the scheme at that time, but on the contrary they commended the scheme and congratulated Government on the boldness and courage shown in undertaking the scheme, which the previous Governments were unable to tackle successfully for one reason or the other. The scheme was considered to be a very sound one and expected to yield a huge profit to Government.

No suggestion regarding the Port Trust and the Royal Indian Marine's consent being obtained for dredging in the harbour.

13. There appears to have been no suggestion at this period that it was necessary to consult the Royal Indian Marine and the Port Trust with regard to possible restrictions on dredging in any area in the harbour.

Dredging plant.

14. In paragraph 47 of his report Sir George Buchanan recommended that the dredging plant should be ordered forthwith.

In paragraph 7 of this Government letter of 4th December, 1919, the Government of India were requested to send telegraphic intimation as regards the immediate sanction required to the proposed purchase of the dredging plant as the offer quoted by Sir George Buchanan was only open for a very short period. The placing of the contract was sanctioned by the Secretary of State in the beginning of May, 1920, and the order for the dredging plant was placed by the Director-General of Stores. The exact date of the placing of these orders is not known to the Government of Bombay, but it must have been placed immediately after the sanction of the Secretary of State for placing the contract.

Purchase of dredger " Kalu."

15. The purchase of the dredger " Kalu " was also recommended by Sir George Buchanan in his letter dated London, 24th September, 1919, to Sir George Curtis, in the following terms :—

" I think your Government ought to ask the Government of India not to sell the ' Kalu ' at present, because with a new pipe line she would do very well for the reclamation on the east of the Colaba Peninsula between Pilot Bunder and Sassoon Dock, which work might go on almost at once."

It was finally decided to purchase the " Kalu " for £75,000 on 21st November, 1919, presumably after consulting Sir George Buchanan, who was in India at that time.

16. From the 3rd January, 1921, the reform system of Government came into force, and the Government then consisted of the following Members :—

His Excellency Sir George Lloyd, Governor.
Honourable Sir George Curtis, Finance Member.
Honourable Sir Ibrahim Rahimtoola, Revenue Member.
Honourable Mr. Maurice Hayward, Home Member.
Honourable Sir Chimanlal Setalvad, General Member.

Sir Chimanlal Setalvad was administrative member in charge of the Development Department until he resigned in June 1923, and the Honourable Mr. Cowasji Jehangir became administrative Member. In April 1921, the Honourable Sir George Curtis was succeeded by the Honourable Mr. Lawrence as Finance Member.

The officers of the Department were as follows :—

Director	Sir Lawless Hepper, from the 8th November 1920 up to the present time with certain brief intervals of leave.
Secretaries	Mr. P. W. Monie, C.S.I., from 8th November 1920 to 8th July 1922, after which he acted as Director up to 7th October 1922.
	Mr. J. R. Martin, C.I.E., from 8th July 1922 to 28th November 1924, with an interval of 3 months from the 5th July 1924 to 4th October 1924, when he acted as Director.

Secretaries (continued)		Mr. R. D. Bell, C.I.E., from 5th July 1924 up to the 1st April 1926, since when he acted as Director with a short interval from 4th October 1924 to 28th November 1924 when he went on special duty in the Public Works Department, Secretariat.
		Mr. A. W. W. Mackie, I.C.S., from 1st April 1926 up to date.
Chief Engineers		Mr. Ll. W. Lewis, C.I.E., from 11th December 1920 to 12th July 1924 with an interval of leave from 20th May 1922 to 10th October 1922.
		Mr. G. M. O'Rorke, C.I.E., acted as Chief Engineer from 20th May 1922 to 10th October 1922 and 21st April 1925 to 19th July 1925.
		Mr. H. A. Elgee, M.I.C.E., from 12th July 1924 to date, with an interval of leave from 21st April 1925 to 19th July 1925.

III.—AGREEMENT ENTERED INTO WITH THE FIRM OF MESSRS. MEIK AND BUCHANAN, CONSULTING ENGINEERS, FOR THE BACK BAY RECLAMATION SCHEME.

MEMORANDUM OF AGREEMENT made this 17th day of March one thousand nine hundred and twenty-one Between CHARLES SCOTT MEIK and SIR GEORGE CUNNINGHAM BUCHANAN, K.C.I.E., carrying on business as Civil Engineers in partnership under the name of Messrs. C. S. MEIK & BUCHANAN at 16 Victoria Street Westminster in the County of London (hereinafter called " The Firm " which expression shall include the said Charles Scott Meik and Sir George Cunningham Buchanan and their successors being partners in the firm and their and each of their respective executors and administrators) of the one part and THE SECRETARY OF STATE FOR INDIA IN COUNCIL (hereinafter called " the Secretary of State ") of the other part.

WHEREAS the Secretary of State is about to carry out a Scheme for the reclamation of a part of Back Bay Bombay which is known as the Back Bay Reclamation Scheme and which comprises the whole of the works described in the report made by Sir George Cunningham Buchanan to the Government of Bombay in September one thousand nine hundred and nineteen.

AND WHEREAS the Firm have been engaged by the Secretary of State as Engineers of the Back Bay Reclamation Scheme and of all works in connection therewith upon the terms hereinafter mentioned.

NOW IT IS HEREBY AGREED as follows :—

1. The Firm agree to act as the Engineers of the Secretary of State in carrying out the said Scheme and in the construction and execution of all works connected therewith (hereinafter referred to as " the works ") until the final completion thereof and the Firm shall at all times assist and advise the Government of Bombay in all matters relating to the execution of the works and shall supervise the same and undertake and perform all work and duties devolving upon Engineers of large works and in particular the following work and duties namely :—

Work in England.

(*a*) The preparation of the working drawings specifications schedules of quantities and rates and estimates of cost for the whole of the work included in the report of Sir George Cunningham Buchanan and such work shall be commenced forthwith and all such drawings specifications schedules and estimates and any fresh or amended drawing specifications schedules of quantities and rates and estimates as may from time to time be required during the progress of the works shall be promptly prepared and forwarded to the Government of Bombay and shall become the property of the Secretary of State.

(*b*) The approval in conference and in conjunction with the Consulting Naval Architect to the Secretary of State of the detailed drawings and specifications of the dredger and floating pipe line and the final inspection and supervision of tests and trials.

(*c*) The approval in conference and in conjunction with the Consulting Naval Architect to the Secretary of State of the detailed drawings and specifications of intermediate pumping stations, shore pipes and the general inspection and trials of the same.

(*d*) The preparation of plans and specifications for all other plant required in connection with the construction of the works and the inspection of such plant and any material required for the works prior to shipment.

(*e*) Correspondence with the Government of Bombay or any Officer deputed to act on their behalf, including any reports from time to time required by Government in respect of the dredger plant or material or the progress of the works.

Work in India.

(*f*) During the whole period of execution the works shall be closely supervised by the Firm, and Sir George Cunningham Buchanan shall devote the greater part of his time to this particular work, and shall, unless the Bombay Government shall agree otherwise, visit Bombay this year and in every year after the monsoon when the working season begins, and remain in Bombay for such period during the working season as he or the Government of Bombay may consider necessary to ensure the complete and satisfactory supervision of the works, and shall also if necessary, in his own opinion or in the opinion of the Government of Bombay make additional visits during any monsoon.

2. If the Government of Bombay shall from time to time require any alterations in the works before or after the commencement thereof or shall require any additional works to be executed all work required to be done in connection therewith shall be within the duties of the Firm under the preceding clause.

3. A Resident Engineer and also a Deputy Resident Engineer (if required and if his appointment is approved by the Government of Bombay) will be nominated by the Firm and will carry out the details of the works in accordance with the Firm's instructions, but subject to the control of the Director of Development or other officer appointed by the Government of Bombay, and they, as well as the whole of the staff, both Engineering and Clerical employed in India in connection with the works, will be paid by the Government in Bombay.

4. In consideration of the services to be rendered by the Firm as aforesaid, the Secretary of State will pay the firm as remuneration a sum equal to two per cent. on the net expenditure incurred by the Government of Bombay on behalf of the Secretary of State in carrying out the works except that in the case of the dredger and of such other plant as is constructed under the joint control of the Firm and the Consulting Naval Architect to the Secretary of State and on which the Consulting Naval Architect to the Secretary of State receives one per cent., the remuneration of the Firm shall be calculated at one per cent. only. For the purpose of payments on account of the Firm's remuneration in respect of plant (including the dredger) the remuneration shall be calculated on 75 per cent. of the expenditure on the plant subject to final adjustment when the plant is disposed of or no longer required or on completion of the works. Such remuneration shall include all the travelling and incidental expenses incurred by the Firm and also their office staff and inspection and other charges in the United Kingdom and journeys to and from the United Kingdom and India.

5. Payment on account of the Firm's remuneration in respect of work paid for in India shall be made quarterly in rupees in Bombay. Payment on account of the Firm's remuneration in respect of plant paid for through the India Office shall be made quarterly in sterling in London. The said remuneration shall be finally adjusted upon the completion of the works or upon the termination of this agreement, and if any dispute shall arise as to the amount of the actual expenditure or the net cost for the purposes of this clause or the preceding clause either upon the completion or during the progress of the works or upon the termination of this agreement the decision of the Government of Bombay shall be final and conclusive.

6. In case any dispute shall arise between the Secretary of State or the Government of Bombay and the Firm as to the works and duties of the Firm or as to the interpretation of this agreement (other than the amount of the actual expenditure or net cost as provided for in the fifth clause) the same shall at the option of either of them be referred to an Arbitrator to be appointed by the Government of Bombay, whose decision shall be final and conclusive on all parties.

IN WITNESS WHEREOF the said Charles Scott Meik and Sir George Cunningham Buchanan have hereunto set their hands and the Honourable the Governor of

Bombay in Council hath caused one of the Secretaries to the Government of Bombay to set his hand and the seal of the said Government for and on behalf of the Secretary of State for India in Council.

SIGNED by the above-named Charles Scott Meik and Sir George Cunningham Buchanan in the presence of— (Sd.) GEORGE C. BUCHANAN.

Witnesses to Sir George Buchanan's signature.

Wimbledon, S.W. 19,
Civil Engineer.

IV.—REPORTS OF SIR GEORGE BUCHANAN ON HIS VISITS TO BOMBAY, 1922-24.

16, Victoria Street,
Westminster, S.W.
11th February, 1922.

From

Sir GEORGE BUCHANAN, K.C.I.E.;

To

The DIRECTOR of DEVELOPMENT, Bombay.

Sir,

I beg to submit the following report on the progress of the Back Bay Reclamation Scheme, which received the general sanction of the Secretary of State in May 1920, my firm under agreement with the Secretary of State being appointed the Engineers.

2. My original report and estimate for the project was dated September 1919 and it will be convenient if in the first instance I briefly trace events from that date.

3. *Method of executing the works.*—In my report I recommended that :—

(*a*) The construction of the 4 miles sea wall be let by contract if a satisfactory tender were received.

(*b*) The Government of Bombay purchase the dredging plant and carry out departmentally the filling with dredged material of the area to be reclaimed.

4. On enquiries being made with a view to letting a contract it was ascertained that owing to the fluctuations in rupee exchange along with the steady rise in the price of machinery, materials and labour no contractor would tender on the pre-war basis of a fixed schedule of rates for finished work but contractors were willing to undertake the work on the basis of an approximate estimate, the Government supplying the funds and paying the contractor, for his work and skill, a percentage on the actual cost. This proposed arrangement was not considered satisfactory but as the work of construction was to proceed simultaneously from Colaba and Marine Lines it was believed more rapid progress might be made if a portion of the work were let by contract. Tenders were therefore invited on the percentage basis for the construction of 8,000 feet of wall from the Colaba end, but when received they were found to be without exception so unsatisfactory from both economic and technical points of view, that it was decided Government should itself carry out the whole work by direct purchase of machinery, materials and plant, employment of Engineers and workmen, and use of sub-contractors.

5. Under the rules of the Government of India for the carrying out of Public Works, the approval of my report, plans and estimates did not imply more than the accordance of administrative sanction to the scheme, and a detailed project estimate giving the fullest particulars under each head and sub-head should have been submitted before any actual expenditure was incurred.

The preparation of this estimate would have taken a staff of Engineers at least one year and when completed would have been valueless, for the same reason that contractors were unable to submit a firm tender, and as time was of importance it was decided to proceed in anticipation of sanction and to prepare the detailed project estimate as soon as reliable data had been collected.

Effect was then given to the recommendation in paragraph 47 of my report, the dredging plant, the railway rolling stock and machinery, and plant for the quarry and works yards was ordered, and work was begun in opening out the quarry at Kandivli, 21 miles from Bombay.

6. *Departure from the* 1919 *Project.*—Some changes have been made in the original programme involving in some cases an increase of expenditure. The principal alterations are :—

(1) In order to conform to military requirements the line of the wall has been brought nearer to the shore at the Colaba end and pushed out in the middle so as to retain the total acreage of reclamation.

(2) The wall at the Marine Lines under construction by the Public Works Department was completed about 1,000 feet short of the original proposal involving a corresponding increase in the length of the new wall.

(3) Under the orders of the Government the construction of the new wall is being proceeded with from both ends simultaneously instead of from one end as originally schemed, involving an increased expenditure in machinery and plant.

(4) Blocks of stone will be substituted for the 20 ton concrete foreshore blocks.

(5) In place of working the auxiliary dredger pumping plant by electricity it has been necessary for reasons given hereafter to provide a much more expensive steam plant.

7. *Delays in proceeding with the work.*—The time programme set forth in paragraph 46 of my 1919 report was on the assumption that the sanction of the Secretary of State to the entire scheme would be obtained by the 1st January, 1920, but as that assumption was not realised, the programme was necessarily modified. In February, 1921, I submitted an amended programme of operations and after describing in some detail the extent and nature of the preliminary works to be executed both at Kandivli quarry and in Bombay I observed that I confidently hoped to see the permanent works begun both at Marine Lines and Colaba on the 1st October, 1921, that being the date I expected the weather to be propitious, the preliminary work completed, and the quarry ready to deliver stones.

The completion of the quarry and other preliminary works depended largely upon the prompt arrival of the machinery and plant ordered from England and every effort was being made to push on the manufacturers and get prompt shipment of the goods by the India Office when the disastrous coal strike caused the suspension of nearly all work for several months and thereby once more upset our programme.

8. There has also been very considerable local delay :—

(1) Much time has been lost in getting delivery of machinery from the Bombay Docks.

(2) When clear of the Docks there has been serious delay in transport by rail and I am informed that on various occasions the Railway Company has taken 21 days to deliver goods to the quarry, being at the rate of 1 mile per day.

(3) The Boilers supplied for use on the works are made by the best makers in England and are accompanied by certificates issued by a Boiler Insurance Compay. At Home, these certificates would be accepted without question but under the Bombay Boiler Act every boiler used in the Presidency has to be rigorously inspected by an Officer appointed under that Act. There is no reasonable objection to this procedure if inspections were carried out promptly, but not only has there been great delay in inspection but the rules made in 1891 are now obsolete and details of construction and steam pressures used all over the world in the boilers provided are condemned in Bombay.

(4) There has been a great deal of sickness amongst the European Staff.

I am not in a position to say whether the delays under the heads 1, 2 and 3 were avoidable. I merely chronicle the facts.

We are now considerably behind our second programme but the Chief Engineer hopes to make up a certain amount before the break of the monsoon.

9. *Progress of the work in England—Plant and Machinery.*—Exclusive of the dredger a sum of approximately £300,000 has been expended on Plant and Machinery. This is not out of the way, taking all things into consideration, and a great deal of the plant will constitute a valuable asset at the completion of the works.

10. My firm was entrusted with the taking in of tenders and supervision of manufacture and the greater part of my time and of our staff has been occupied in that connection. We took trouble in every case to recommend to the India Office the lowest tender consistent with workmanship and design. The machinery with the exception of the quarry drilling plant, was obtained from British firms, as at that time works on the Continent were not yet recognised for the supply of machinery. We made, however, various enquiries in America and the Metropolitan Wagon Company of England who obtained the order for railway wagons, were £50,000 lower in their tender than the American firms.

11. *Purchase of Dredger and Pipe Lines.*—In 1919 I obtained from Messrs. W. Simon & Co., Ltd., a tender amounting to £410,454 for the provision of the dredger and auxiliary plant. The tender was on the basis of rates current for wages and materials, with the proviso that all advances on these rates should form an extra charge, at the same time Messrs. Simon & Co. offered to accept a total fixed price of £451,500 and take on their own shoulders the risk of further advance in the cost of labour and material. I also made arrangements with the Tata Electric Power Company to supply current for the working of the auxiliary dredger.

12. Unfortunately sanction to the purchase of the dredger was not received in time to take advantage of Messrs. Simon & Co.'s offer, which was only available for three months, and when the case was re-opened by the India Office in May 1920 and the order placed, the total amounted to over £650,000, an addition of £200,000, of which £100,000 was due to the fact that in 1920 the Tata Electric Power Company were unable to guarantee the supply of current, and an expensive steam auxiliary dredger had to be substituted for the electric plant.

Moreover, the estimate in 1919 was based on an exchange of Rs. 12 to a pound but with exchange rate at Rs. 15 to the pound the cost of the dredger works out at Rs. 110·62 lakhs compared with the original estimate of 50·6 lakhs.

13. It may be asked why the dredger was ordered when prices had increased so greatly, especially when the works are not sufficiently advanced for its immediate use. The answer to this very legitimate question is that it was considered necessary to order the dredger well in advance of actual requirements in order to ensure delivery.

It was impossible to foresee the collapse of the business boom and the resultant fall in prices and as there was at the time, and there is still, a world's shortage of dredgers, it was anticipated that there would be a long waiting list of orders in the hands of the Builders.

Another consideration which must not be overlooked is that a dredger usually has a somewhat perilous voyage across the ocean, and were it to be lost it is always advisable to have some time in hand to build another one.

14. The dredger " Sir George Lloyd " was launched on the 21st October and satisfactory pumping trials were carried out on the 24th November, 1921, speed trials were carried out on the 26th November, 1921, and as certain defects were noticed the vessel was sent back to the ship yard for some alterations. New speed trials were to be held on the 19th January the results of which have not yet come to hand.

The auxiliary dredger " Colaba " had not been tested at the date of the last report.

15. The Architects for the plant are Messrs. Sir J. H. Biles & Co. (the Consulting Naval Architects to the Secretary of State) with whom my firm has been associated.

16. *Progress of the work in India.*—The work has been divided into three sections :—

(i) Quarry.
(ii) Marine Lines.
(iii) Colaba,

and I will describe these sections separately.

The Chief Engineers's programme for this season's work contemplates the construction of 2,000 feet of finished wall from the Marine Lines end, and 2,000 feet of finished wall from the Colaba end. I have every hope that notwithstanding the delays which have occurred, the programme will be completed ; if there had been no delays the programme could have been materially exceeded.

17. *Quarry Section.*—This is situated near Kandivli, a station 21 miles up the B. B. and C. I. Railway where we were fortunate in finding a hill 250 feet high of solid Trachite ; an output is being aimed at of 2,000 tons or more per day a considerable proportion of which will be in solid blocks up to 15 tons weight each, and for such a size and tonnage very considerable works have had to be executed, of which the following constitute the principal items :—

1. Laying the Railway Siding to connect the quarry with the B. B. and C. I. Railway main line.
2. Housing of staff and employees aggregating several thousand people.
3. Construction of a Power House to supply power to the Air Compressors for drilling purposes and erection of workshops and stores for the repair, maintenance and working of the extensive plant.
4. Provision of a water supply to give 50,000 gallons per day, involving the collection of water from wells scattered at considerable distances and pumping to a service reservoir.
5. Erection of steam cranes, steam derricks, stone crushers, Locomotives and other machinery.
6. Preparation and levelling of quarry floor.

18. The work was taken in hand about the beginning of 1921 and carried on throughout the monsoon. The difficulties to contend with were numerous and were aggravated by a severe epidemic of malarial fever which reduced the working efficiency of staff and employees.

The operations may now be said to be practically finished and I have no hesitation in stating that the results reflect the greatest credit on the Chief Engineer Mr. Lewis, and the Senior Deputy Chief Engineer Mr. O'Rorke who has been the officer directly in charge.

19. If I were to make a criticism it would be that the works are too good and of too permanent a nature for merely supplying stone in connection with the Back Bay Scheme. On the other hand it pays to house well your staff and employees and to put rain-proof buildings over good machinery and if, as anticipated, the quarry is made a permanent source of supply for Bombay, the expenditure is fully justified.

20. *Marines Lines.*—The preliminary works comprised the laying of railway sidings, erection of cranes, concrete mixers, pile drivers and other machinery, small workshops and stores, and staff quarters. On completion of the above the construction of the timber temporary gantry was taken in hand, the purpose of the gantry being to provide accommodation for wagons of rubble stone conveyed by rail from Kandivli quarry, the contents of the wagons being tipped from the gantry to the site of the wall. By this means a solid rubble mound will be formed from ground level to high water mark and on the mound will be constructed a concrete superstructure to a level of 9 feet above high water. The rubble mound will be potected from sea attack by heavy stone blocks laid on the outside.

The building of the gantry began early in December and up to the end of January 119 piles had been driven and 476 feet of gantry finished.

21. I regret that I cannot feel satisfied at this performance as even making all allowances for time lost in training men, I think that with the machinery provided half as much again should have been completed in the time.

It is fair to say that there has been an improvement during the last weeks which, if maintained, will possibly permit of the season's programme being carried through.

22. *Colaba.*—My original plan provided for a mass concrete wall 16 feet thick at the base and 12 feet thick at the top for the first 2,000 feet and thereafter the design corresponded with that already described for Marine Lines. Subsequently it was proposed to build a concrete block wall 16 feet thick and 8,000 feet long before following

the Marine Lines type, but finally we reverted to my original design for a mass concrete wall.

23. In all the schemes for the reclamation of the Back Bay, stress has been laid on the necessity for a particularly strong wall to resist the severe sea attack and our plans were made accordingly.

I have now had the advantage of living for two months on the works at Colaba and I have come to the conclusion that for the 10,000 feet of wall situated on the reef, the sea attack will be negligible because, however great the storm, there will be immense protection afforded by the reef itself outside the wall.

I have personally explored the reef from end to end and I find that it constitutes not one but many break-waters which will reduce the biggest waves into froth and spray. As a proof thereof numerous flimsy rubble walls built for use as fishtraps may be seen scattered over the reef, resisting the whole force of the monsoon year after year without repair.

24. We have now reduced the thickness of the mass concrete wall from 16 feet to 12 feet and a still smaller section would be sufficient were it not there must be sufficient width to take a line of rails along the wall for construction purposes or alternatively build special staging. Moreover from 2,000 feet to 10,000 feet we have in consultation with the Chief Engineer, Reclamation Department, decided to dispense with the timber gantry and build the wall by wall by means of an ordinary tip from end tipping wagons and we shall probably materially reduce the size of the concrete superstructure.

25. At Colaba the preliminary and temporary works comprise the erection of machinery, laying of tram lines, railway connection along the foreshore to Marine Lines, collection of stones on the reef for the mass concrete wall, and provision of quarters and lines for employees.

The work was delayed owing to the severe illness of the Deputy Chief Engineer, but by the 31st of January 650 feet of wall foundation had been completed, and I see nothing to prevent completion by the end of May of the 2,000 feet contemplated in the programme as the work is now proceeding in a thoroughly satisfactory manner.

26. *Programme of future operations.*—I understand that there are cogent reasons for pressing ahead with the completion of the scheme from the Colaba end even at the expense of progress at Marine Lines.

The only temporary work of any importance now outstanding at Colaba is the construction of the broad gauge railway connecting Colaba with Marine Lines, thereby enabling whole trains of stone from Kandivli to be transported direct to Colaba. This work is about to be put in hand, and once it is completed and the necessary terminal arrangements made at Colaba for the automatic transfer of stone from side to end tip wagons, wall construction from the Colaba end can proceed at full speed, and in my opinion can be continued throughout the monsoon. There are about 150 trains of stone required for the rubble mound or at 45 trains a month say 3½ months to complete the 8,000 feet on the reef, which, with the 2,000 feet of concrete wall now under construction, will make a total of 10,000 feet of wall or nearly half the entire length.

On completion of the rubble mound the building of the concrete superstructure will be put in hand, but that need not hinder the deposit of pump filling, and the dredger can begin operations as soon as the rubble mound is sufficiently advanced and the cross wall put in.

27. It is impossible to fix a date for starting the dredger. Had it not been for the delays in beginning the work this season, I am of opinion that wall construction would have advanced sufficiently to make it worth while beginning the dredging operations at the end of the current year, and this possibility should still be kept in view and one pipe line laid across the peninsula in order to be ready for eventualities.

In any case, the whole of the 10,000 feet of wall from Colaba end, including the superstructure, should be finished by May, 1924, and the dredger begin work in that section about October, 1923.

The wall from Marine Lines should advance at the rate of 3,000 feet per annum and join up with the Colaba wall in the spring of 1925. But it may be desirable to keep open a gap until the dredger is ready to operate in the Marine Lines section.

28. To fill the entire area enclosed by the wall requires six seasons' dredging or, say, up to the end of May, 1929, on the supposition that the dredger begins in 1923 and the work continues without a hitch. That does not, however, mean that land would not be available for occupancy until that date, because by some additional expenditure on cross bunds every season or two seasons work can be isolated and completed. Much depends on the nature of material dredged, and that can only be definitely ascertained when actual dredging begins.

29. *Engineering Staff.*—In carrying out a large public work departmentally success, both economic and technical, depends to a large extent upon the adequacy, efficiency, and loyalty of the engineering staff, technically because apart from actual design much depends upon workmanship, and economic because the spending of money and the employment to the best advantage of workmen is entirely in their hands.

Government is in regard to its staff at a disadvantage compared with a contractor or a private firm. The loyalty and enthusiasm of a staff is often taken for granted, but it is rarely spontaneous, and in the case of a contractor or private firm bonuses are given for particularly good work, and in other ways officers are encouraged to do a great deal more than is strictly required of them; also on the converse side if an engineer is inefficient a contractor will cut his losses and get rid of a man by paying whatever is legally due in lieu of notice. Government rules preclude either bonuses or pay in lieu of notice, and I merely mention this matter because it is one of the chief advantages gained in employing a contractor for the execution of public works.

30. Under section 3 of the agreement with my firm we nominated for the offices of Resident and Deputy Resident Engineers respectively Mr. L. W. Lewis, of the Government of India, Public Works Department, and Mr. G. O'Rorke, their titles being subsequently changed to Chief Engineer, Reclamation Branch, and Senior Deputy Chief Engineer.

The Chief Engineer deals with works of reclamation other than the Back Bay Scheme, but the Senior Deputy is at present engaged solely on that work and is at present in charge of the quarry at Kandivli.

In addition to the above there are two Deputy Chief Engineers in charge of the Colaba and Marine Lines sections of the works respectively, and each of these has an Assistant Engineer attached to his section. There is also an Assistant Engineer at the quarries.

31. I doubt very much if the staff is adequate; the Assistant Engineers are not sufficiently trained to act, if required, for the Deputy Chief Engineers, and in case of one of these officers falling sick or going on leave, the work must suffer. A case in point occurred recently at Colaba when just at the beginning of the working season the Deputy Chief Engineer was absent in Hospital for some weeks, and when the Chief Engineer goes on leave this year and the Senior Deputy Chief Engineer acts for him, a chance casualty amongst the remaining staff might prove very serious from the point of view of works progress and works economy. On large public works involving great expenditure it is more economical to be rather overstaffed than the reverse, and in the East provision must be made for casualties.

32. I recommend the appointment of at least one additional Engineer, with experience in marine works, of the Executive Engineer's grade who would be posted wherever his services were most required, and who would be available to act at any time as a Deputy Chief Engineer. I think this officer should be a European because it is almost impossible to obtain an Indian Engineer with marine experience, and there is a larger field for selection amongst Europeans.

I also make the suggestion, for what it may be worth that, as is done on large works in Europe, each Deputy Chief Engineer might have attached to his staff on a nominal salary a young Indian Engineer specially selected, who would be given the opportunity of obtaining practical experience of the works.

33. *Engineering Accounts.*—In addition to an efficient Engineering staff the success from the point of view of economical execution of a work carried out departmentally depends upon the proper keeping of accounts.

As previously stated the practice in India is to have a project estimate prepared by the Engineers and sanctioned by competent authority before the work is put in hand, and this project estimate and subsequent works estimates are placed in the hands of the Government Accounts Department who, through their auditors scrutinize all statements of expenditure submitted by the Engineers, and check each item against the sanctioned head of account, at the same time furnishing the Engineers with debits of various kinds which may have not reached them at first hand.

An Engineer is not thereby absolved from the responsibility for his accounts but the check acts as a safeguard, because any irregularity or excess on a head or sub-head of the estimate should be brought promptly to his notice by the receipt of an objection statement.

The Engineer's accountant although under his orders is appointed by the Accounts Department and much depends upon his qualifications.

A good accountant should be more than a mere recorder of figures. He should be able to assist the Engineer by the analysis of cost under many sub-heads which do not necessarily appear in the project estimate.

34. The practice in England differs from that which obtains in India. Works are sanctioned on estimates to which in India only administrative sanction would be given, but whether the works are executed by contract or departmentally the Engineer has to be in close touch with costs from day to day, from beginning to completion of the works, and by means of a competent accounts staff and a reliable system of cost keeping as differentiated from account keeping, the Engineer knows exactly where there has been excess on the smallest sub-head of his estimate or where money has been saved.

Both Indian and English systems have their good points and that in India is the result of many years' experience. I have worked with both and venture to suggest that a weak point in the Indian method is that works accountants are frequently not more than figure recording clerks, and when as a member of the Indian Munitions Board I was in control of the Indian Ordinance Factories, we entirely reorganized the accounts system, with the co-operation of the Accounts Department, and in each factory accountants receiving perhaps Rs. 100 to Rs. 150 per month were replaced by Indian accountants of much more experience and receiving 3 and 4 times the pay who were capable of assisting the Superintendents in practical cost analysis.

35. My excuse for writing at length on this subject apart from its general importance, is that the accounts of the Back Bay Scheme do not appear to be kept on either one or the other of the systems described above. Although works estimates have been made, there is as yet no sanctioned project estimate. The Chief Engineer keeps no accounts nor has he been furnished with up-to-date statements of expenditure by the accounts branch in order that he may see how matters stand. In this connection I wrote to the Chief Engineer on the 7th January, asking to be supplied for the purpose of this report, with a statement in some detail giving the total expenditure on the project up-to-date or reasonably so, the Chief Engineer asked the Accounts Department for the information and on the 21st January I received a statement of expenditure up to the end of October, which can hardly be called up-to-date nor did it contain sufficient detail to be of any practical use.

36. The accounts are kept on what is known as the pre-audit system which means, as the name conveys that no payments are made until the accounts have been audited, and one of the chief recommendations for the system is that the audited accounts are supposed to be always written up-to-date.

Under such a system there is no object in the Chief Engineer keeping account books, but it is of the first importance that he should be furnished at least once a month with an up-to-date statement of expenditure on all heads of account, whilst each Deputy Chief Engineer should be able to rely upon a current audit and the prompt supply of all debits against his estimates.

37. *Revised Estimate.*—The estimate accompanying my 1919 report amounted to lakhs 367·61 at Rs. 12 to the pound sterling and this sum was increased by the Government to 4 crores.

The estimate was based on the most reliable figures obtainable and no one could forecast either the tremendous upward bound in prices, or the depreciation in the value of the rupee. To give one example typical of many steel plates and angles which were £18 per ton in September 1919 rose to £24 10*s.* per ton in May 1920 and remained at that figure until the end of the year, during which period the bulk of the material for the dredger and other plant was purchased.

The price of labour rose in proportion both at Home and in India, and in Bombay in particular the Engineers inform me that labour both as regards cost and efficiency compares unfavourably with other parts of India.

38. In the 1919 estimate I assumed that the work of constructing the wall would be let by contract, and that the contractor would purchase the plant necessary and carry out all temporary works, but in the revised estimate I have included separate items on this account under the various main heads and I have included quarry as a main head.

Under the sub-head moorum for surface filling the area to be covered has been reduced because at a conference in London with Mr. Davidge, the Town Planner, it was agreed that laying moorum over land ultimately to be covered with buildings was an unnecessary expense.

Under the head dredging, cost of plant has been kept distinct from working expenses, and the purchased price of the dredger " Kalu " and the cost of the pipe line which had not been arranged for in 1919 has been added to the plant.

Under the head, roads, lights and drains the original Public Works Department estimate in 1912 was 59·45 lakhs, which was increased by me in 1919 to 75 lakhs. In neither of these estimates was any allowance made for sewering the reclaimed area, as it was believed this would be done by the Municipality. I understand that such is not the case and also that Municipal rules demand better roads than those originally provided. I have therefore increased the estimate under this head to 135 lakhs.

39. The total revised estimate of gross cost at Rs. 15 to the pound amounts to Rs. 668·89 lakhs, as per appended statement, but it is obvious that this sum does not represent the real cost of the work, as there are considerable reductions to be made on account of the capital value of the dredger, the quarry and the plant and machinery at Marine Lines and Colaba when the Back Bay Scheme itself is completed. The dredger may be used on other works or sold, whilst as already pointed out the quarry will be a valuable asset for many years to come, will supply stone for East Colaba wall and other works, and stone for the buildings to be erected on the reclaimed area. It is impracticable at the present time to put a final value on the above, but the Chief Engineer and I agree that 70 lakhs is a reasonable minimum sum and therefore that sum has been deducted from the gross amount of estimate which brings the nett cost to Rs. 598·89 lakhs.

40. *East Colaba Reclamation.*—My estimate in September 1919 for this work was Rs. 39·76 lakhs, and in May 1921 the Chief Engineer, Reclamation Department, sent my firm for criticism a copy of the preliminary estimate prepared by him amounting to Rs. 71·07 lakhs.

In a letter dated 18th July 1921 we replied to the Chief Engineer and stated that the prices were higher than we had experienced on other works we had carried out. We made certain proposals and suggested that I should go into the matter fully when I next visited Bombay as it was difficult in a letter, without knowing more of the circumstances to discuss the merits of the respective proposals. This letter crossed a letter dated 20th July from the Chief Engineer saying that he had reduced his estimate to 46·71 lakhs and giving reasons for so doing.

I understand that the position now is that the Chief Engineer has been asked to supply a detailed project estimate and on its completion we will go into the matter further.

41. *Conclusion.*—Although the delays in beginning the work have been most regrettable and valuable time has been lost I am well satisfied with the future outlook. The difficulties inevitable when commencing a large engineering work have been overcome and there is so far as we can see a straight road ahead.

Wall construction will be easier and speedier than I anticipated, and the only uncertainty concerns the exact nature of the material to be dredged from the harbour and used as filling.

In my opinion there should now be a concentration on the following :—

(1) Railway connection between Colaba and Marine Lines.

(2) Preparation of terminal arrangements at Colaba and purchase of end tipping wagons.

(3) On completion of Nos. 1 and 2, construction of stone mound to a distance of 10,000 feet from Colaba and cross bunds as required.

(4) Erection of dredger's floating pipe line and laying of the land pipe line for the dredger to serve that area.

42. I have in this report expressed my opinion freely on all points conceiving it my duty so to do in view of paragraph 1 of our agreement which says that:—

" The firm shall at all times assist and advise the Government of Bombay in all matters relating to the execution of the works."

I have the honour to be,

Sir,

Your most obedient servant,

(Signed) GEO. C. BUCHANAN.

Bombay, 11th February, 1922.

BACK BAY RECLAMATION SCHEME.

REVISED ESTIMATE (1922).

Item.	Description.	Unit.	Quantities.	Rate.	Lakhs of rupees.	Lakhs of rupees.
1	*Kandivlee Quarry*—

Appendix to my report of this date.

(Signed) GEO. C. BUCHANAN.

Bombay, 11th February, 1922.

Bombay, dated 10th January, 1923.

From

SIR GEORGE BUCHANAN, K.C.I.E.,

Bombay;

To

THE DIRECTOR OF DEVELOPMENT,

Bombay.

Dear Sir,

I beg to submit the following report on the progress made with the Back Bay Reclamation Scheme.

2. In my report dated 11th February, 1922, I described the action taken up to date under the various heads, and said that the programme of permanent work for the season 1921-22 contemplated the construction of 2,000 feet of finished wall from the Marine Lines end and 2,000 feet of finished wall from the Colaba end. I discussed the programme of future operations, and the reasons for pushing ahead the work at Colaba even at the expense of progress at the Marine Lines, and to that end I urged a concentration on the work of building the Marine Lines-Colaba Railway along with the necessary terminal arrangements at Colaba for the transfer of stone from side tip to end tip wagons.

In the matter of dredging I said that although I could not definitely fix a date for beginning operations, the possibility of dredging in 1922-23 should be kept in view and a pipe line laid across the Peninsula in order to be ready for eventualities. Lastly I made some observations on the necessity for strengthening the Engineering Staff and for the keeping of Engineering Cost Accounts.

Work Accomplished.

3. The 2,000 feet length of mass concrete wall at Colaba was completed by September, 1922, and 2,050 feet of rubble and 1,850 feet of concrete wall at Marine Lines was completed by June, 1922. The Marine Lines-Colaba Railway and terminal transfer station are practically completed but no action has been taken towards laying the first pipe line across the Peninsula.

It is matter for great regret that the work of constructing the Marine Lines-Colaba Railway was not begun until the month of May, instead of February, which was the date of my report, as three precious months were lost at the best working time of the year with a corresponding delay at the beginning of this working season.

Programme of Wall Construction.

4. The wall will be 21,578 feet long; 10,500 feet of rubble mound from Marine Lines is being built from a timber gantry whilst the 11,078 feet from Colaba is as regards 2,000 feet, a mass concrete wall, and for the remainder a similar rubble section to Marine Lines but built by means of end tipping wagons dumping ahead instead of side tipping wagons from the gantry.

According to the programme drafted by my firm in April 1921 wall construction was to begin in October, 1921, and the wall was to be completed by 31st May, 1925. The Chief Engineer, Reclamation Department, in his Project Estimate, dated October 1922, did not see his way to finishing the wall until 1926, but he has since revised the date and the following is his latest programme :—

	1921–22.	1922-23.	1923-24.	1924–25.	Total.
	Lin. ft.	Lin. ft.	Lin. ft.	Lin. ft.	Lin. ft.
From Marine Lines	2,000	3,000	3,000	2,500	10,500
From Colaba	2,000	4,500	4,578	—	11,078
Total ...	4,000	7,500	7,578	2,500	21,578

From above it will be seen that it is proposed to construct this season 3,000 lineal feet of finished wall from the Marine Lines end, 4,500 feet from the Colaba end and one cross wall 3,000 feet long and the following table supplied to me by the Chief Engineer, Reclamation Department, shows details of the stone required.

Back Bay Reclamation Scheme—Programme 1923.

	Length of wall to be built.	Quantity of rubble.	Quantity of protection stone.	Quantity of crushed stone for concrete.	Total quantity of stone required.	Total quantity in number of wagons.
	Lin. ft.	Tons.	Tons.	Tons.	Tons.	
Marine Lines	3,000	53,034 Mid.	19,955 April.	10,711 May.	83,700	4,185
Colaba	4,500	56,156 End	25,181 April.	15,500 August.	96,837	4,844
Cross wall	3,000	52,090 End	— July.	—	52,090	2,605
					232,627	

233 Trains, say 240 at 12 per week = 20 weeks work.
Work to start in full on 1st January, 1923.

Probability of completing this season's Year's Programme.

5. At the date of this report the position is as follows :—

At Marine Lines the driving of the piles for the gantry has reached chainage 4,300, leaving 700 feet to complete the 3,000 feet and 2,880 tons of stone have been tipped on the new length of wall. At Colaba tipping from end tipping wagons has not yet begun but a start is expected very shortly.

The output of the Quarry according to the report accompanying the Chief Engineer's Project Estimate is 2,000 tons per diem, or considerably in excess of what is required, so that theoretically there should be no difficulty in carrying out the work, but it must be remembered we are already three months late in starting the season's operations. The Chief Engineer has only allowed in his programme for one cross wall at Colaba, 3,000 feet long, but it is of great importance to build also the cross wall 1,500 feet long opposite Church Gate Street so that the reclamation of the Marine Lines Area by means of the Dredger " Kalu " may be taken in hand this year.

Opinion of Work Executed.

6. The work carried out up to date is substantial, and I am satisfied that the wall as designed by my firm will be solid enough to withstand the force of the strongest monsoon waves. The settlement of the mass concrete wall on the rubble mound at Marine Lines has been less than was anticipated, but there is room for considerable improvement in the workmanship, as, due probably to defective bracing of the shuttering, indicative of inadequate subordinate supervision, the line is not true. The strength of the wall is not affected and the coping will hide the defect, but it is not first class work, and if done by a contractor would not be accepted.

A more serious matter concerns the quantity of stone used in the mound. I requested the Deputy Chief Engineer to have some sections taken in order to see how the wall conformed with the drawing, and I find that the quantity of stone on the outer slope is in excess to the extent of about 50 per cent. In actual figures about 60,000 cubic yards have been deposited as against about 40,000 required which, reduced to money, means that the 2,000 feet of rubble mound has cost Rs. 75,000 more than it need have done. It is usual in a work of this kind for Cross Sections to be taken periodically to check the line of the slope and if this is not done the amount of stone may be in deficit to an extent to endanger the wall, or in excess to an extent greatly unnecessarily to increase the cost.

It is also of importance that the stone despatched from the Quarry should be as large as can be reasonably obtained. The procedure at the Quarry is to do a great deal of the work of loading the wagons by hand labour. This is cheap and fairly speedy, and can be used for the considerable percentage of small stone (probably 50 per cent.) brought down by every blast. What we do *not* want, however, is for stone to be broken up specially in order to suit hand labour. We want what is known as the " Run of the Quarry," big and small, just as they come. To do this it may be necessary to alter the layout so as to bring both cranes and wagons nearer the Quarry face and, if necessary, this should be done.

I find that in many cases the wagons are not being fully loaded at the Quarry, thus delaying the work and increasing the cost of the transport of the stone. The wagons were designed to carry 20 tons at 20 cubic feet to the ton, but the stone has proved lighter than was anticipated, and rubble runs to 27 cubic feet to the ton, therefore a 20 ton wagon only carries about 15 tons of stone, but measures are being taken to remedy this defect by increasing the height of the sides.

I examined a train of stone recently containing 44 wagons, some of which had had their sides raised, and the total weight of stone contained in the wagons was 576 tons, or 13 tons per wagon. One wagon contained only one stone weighing 1 ton, that is to say the cost of transport of that one stone was 20 times in excess of the estimate.

Dredging.

7. The successful reclamation of the enclosed area by means of pumping material dredged from the sea bed is the crux of the whole scheme. The sanctioned project provides for the dredging of material from the Harbour and pumping it through pipe lines laid across the Colaba Peninsula, but since that arrangement, the Harbour Authorities have curtailed considerably the area hitherto believed to be available, the portion cut off containing according to the borings, the most suitable material. It was therefore decided last year to investigate the possibilities of obtaining good material from Back Bay itself in order to supplement the Harbour supply and more especially for the Marine Lines end of the work, where the lead from the Harbour would be very considerable. Some borings were taken and the result seemed to the Chief Engineer, Reclamation Department, sufficiently favourable to warrant a more complete testing of the ground and that is now in course of execution. Personally, although I should welcome a supply of good material from Back Bay and believe that the Marine Lines area can be reclaimed therefrom by the dredger "Kalu," I doubt very much from the nature of the borings already taken, whether there will be a sufficient depth of dredgable clay to warrant the use of the large dredger, there are also considerations of navigation to consider and the effect the deepening of the sea bed may have an increasing wave action. Lastly I understand there are five or more cables of the Eastern Telegraph Company laid across Back Bay and these must be collected and localized.

For the above reasons, whilst agreeing that full investigation should be made of the Back Bay Area I am averse to delaying the arrangements already made for dredging from the Harbour. In the programme of work drawn up by my firm in April 1921 we fixed the date for beginning dredging and filling at Colaba for December 1922 and I still consider that it should have been possible to be dredging this season.

The Chief Engineer, Reclamation Department, in his Project Estimate, fixed the date for the end of 1924 and the completion in 1929-30 but has since agreed to make an effort to dredge towards the end of the current year. There should be no doubt at all about beginning this year, and with two Dredgers, the large one pumping from the Harbour and the small one from Back Bay, I believe it possible to complete dredging during the season 1926-27. If however, no action is taken in laying the first pipe line until all the borings in Back Bay have been made, and the results tabulated and considered, I am afraid another season may pass without the dredger getting to work.

I also recommend that very early action be taken in putting the dredger "Kalu" into working order and arranging for any additional pipe line and a terminal pontoon if such are required.

In a recent memorandum I recommended the appointment of an Executive Engineer in charge of dredging, but on reconsideration I consider the work of such importance that I am of opinion the appointment should be that of Deputy Chief Engineer, if an Officer with the necessary experience can be obtained.

Cross Wall.

8. The Chief Engineer, Reclamation Branch, has allowed for eight cross walls against our four, the amount of stone involved being equivalent to that required for the whole of the sea wall. Until the nature of the material dredged is actually seen, it is impossible to say how many walls will be required and it may be necessary to divide the area into still smaller sections, but I hope by using murum in conjunction with stone a saving in the latter may be effected.

Staff.

9. The work both at Marine Lines and Colaba has I am afraid suffered from lack of supervision and competent Engineering Assistance, effect has now been given to the recommendation made in paragraph 32 of my report dated 11th February 1922 for the appointment of an additional Engineer and the officer arrived last month. He should in my judgment be posted to the Colaba Section under Mr. Billinton as that is where he could at present be of the greatest use and in case of need he is capable of acting for either of the Deputy Chief Engineers.

Accounts.

10. Action is being taken on the recommendations contained in paragraphs 33, 36 of my report dated 11th February 1922. An assistant has been appointed to assist the Deputy Chief Engineer, Quarries and an Accounts Officer of the Government of India has been deputed to consider the whole question with a view to giving assistance to the Deputy Chief Engineers, Colaba and Marine Lines.

If this can be arranged I am satisfied that considerable economies in carrying out the work can be effected. It is not sufficient to keep within the Project Estimate, as I consider some of the rates in that estimate are too high and could be reduced in practice, and to give one example of the use of costs if the Deputy Chief Engineer, Marine Lines, had been analysing his costs he would have ascertained that too much stone was being placed in the rubble wall.

General Remarks.

11. Speaking generally, I am of opinion that the works have made fair progress considering the difficulties experienced, and the shortness of staff but I doubt if there is sufficient planning ahead, and Co-operation between the Chief Engineer and the Deputy Chief Engineers. If the latter are not kept fully informed as to the general programme of the work it makes it very difficult for them to look ahead in their plans and arrangements, conferences held at frequent intervals are of great benefit to works under construction, and promote mutual confidence among the members of the senior staff.

The Engineer in charge, must of necessity look many months ahead of the work and cannot spare the time for daily details. The Deputy Chief Engineers in their turn must also spend part of their time preparing the work a few weeks ahead and the Assistants confine themselves to the daily routine duties.

In particular the Annual Programme of work should be worked out in the greatest detail in close conference with the officers concerned, otherwise, smooth working is impossible.

12. As informed you verbally I am leaving for England on the 20th instant returning to Bombay about the first week in July as I am anxious to see Back Bay under Monsoon conditions.

I am, Dear Sir,
Yours Faithfully,
(Signed) GEO. C. BUCHANAN.

BACK BAY HOUSE,
Colaba, dated 26th July 1923.

From
SIR GEORGE BUCHANAN, K.C.I.E.,
To
THE CHIEF ENGINEER,
RECLAMATION BRANCH,
DEVELOPMENT DEPARTMENT.

Dear Sir,

With reference to my inspection of works and conference with you on various points I have the following observations to make.

Colaba.

(1) You are considerably behind-hand in your programme for the year but this is largely accounted for by the shortage of output at the Quarries which again was caused in your opinion by the outbreak of plague at Kandivlee and subsequent shortage of labour.

In any case you should complete the programme during the monsoon and the next season's work will not be affected.

(2) There is more small stone in the mound than I like to see, but you have a good outside line of protection by large stone and it is agreed that for next season's work the Quarries will be instructed that stone below a certain fixed weight is not to be despatched for deposit on the wall.

(3) I enclose a copy of a letter and sketch cross section received from Mr. O'Rorke when he was acting Chief Engineer. We discussed the matter at Home and now with you and it is understood Mr. O'Rorke's proposal is approved.

(4) Next season, if there is any likelihood of stone output being short, I am strongly of opinion it would be better to curtail the length of the mound in order to consolidate in the rear and complete the concrete wall before the advent of the monsoon, as the mound *minus* the Concrete wall and with no large stones on the inside slopes suffers considerably from the monsoon seas. Also the large quantity of protection stones can be placed by the Crane travelling on the wall and the work thus rendered secure.

(5) You have shown me that the present level of the top of the mound is really a little too low as waves even in the fair weather top the mound and wash out small stones thus destroying the temporary track. I see no objection to raising the mound level two to three feet. More stones will be used but this will be compensated for by the saving in concrete, in time, and the wear and tear of plant.

Marine Lines.

(6) The season's work is complete with the exception of the protection stones to be set by the 20 ton Crane. The work is substantial and reflects credit on the Engineers in charge, but as at Colaba a good deal of the stone is on the small side. No time should be lost in finishing the protection pitching with the 20 ton Crane and next season, I hope, all the protection work will be finished before the break of the monsoon or alternatively the length of work curtailed.

Storm Water Drain and Cross Bunds.

(7) We sent you out our design for above along with our idea as to the method of construction.

You propose an alternative method and as you are carrying out the work you must exercise your own discretion especially as no principle is involved.

(8) In the matter of Storm Water Drains and Bunds at Colaba and Marine Lines respectively which enclose the first area to be reclaimed by dredgers, I have proposed to move the bunds to one side of the drains instead of immediately over them, as otherwise, I see no prospect of completing the bunds in time to begin dredging in say November. I understood you agree to this procedure and the work should be pushed forward with all possible speed.

Dredging.

(9) It is understood that the scheme put forward in our letter dated 3rd May 1923 and shown on Drawing No. 3411, dated 2nd May, will be adopted and we hope that the additional length of pipe line and renewal parts for the " Kalu " will be out in time for both the Dredgers to do good work in the coming season.

(10) In Mr. Brims, the officer selected by us to take charge of dredging operations, you will have an Engineer of great experience and we suggest that he should have a fairly free hand and be made responsible for everything connected with dredging, *i.e.*, control of dredgers and Dredging Masters, Laying of pipe lines, indenting through you for all stores required on Dredgers or elsewhere and generally in consultation with you the making of all necessary arrangements.

He should also be responsible for keeping the cost of dredging and should give you periodical reports and cost statements of which we should like copies. Mr. Brims should be provided with quarters on the works.

East Colaba Reclamation.

(11) I notice that a certain amount of work has been done and stone deposited but it is understood that at the present time work is to be concentrated on finishing the season's work at Colaba including the two cross walls at Colaba and Marine Lines respectively. I brought out with me Drawing No. 3435, dated 23rd June showing the section we propose for the East Colaba Wall.

You observe that for the same reason you wish to raise the level of the mound at Colaba you would like to raise the level of the stone on our section and to this I have no objection. I also agree that the concrete pavement might be of tar macadum.

We have discussed the Storm Water Drains across the area reclaimed and they present no difficulty.

(12) I consider that notwithstanding the shortage of output at the Quarries which has most seriously interfered with the completion of the Colaba Section, good progress on the whole has been made with the work since my last visit and we should like a special effort made to have the cross bunds finished, pipe lines laid and dredging begun in earnest at the end of the monsoon.

Yours faithfully,

(Signed) GEO. C. BUCHANAN.

(Through the Director of Development.)

Bombay, 14th February, 1924.

From

SIR GEORGE BUCHANAN, K.C.I.E.,

To.

THE DIRECTOR OF DEVELOPMENT, BOMBAY.

Dear Sir,

I beg to submit the following report on the progress made with the Back Bay Reclamation Scheme.

WORK EXECUTED.

Sea Wall.

At the close of last season's operations the gantry at Marine Lines had reached Chainage 5,100 feet. Work was renewed on the 22nd October 1923 and by the 22nd December 1923 the total length was 6,550 feet which concluded the season's work on gantry construction. Tipping stone to form the rubble mound was begun on the 1st December at chainage 5,030 feet, was completed to chainage 5,920 feet on the 11th February and is expected to reach chainage 6,450 by the 7th March. The concrete superstructure was finished to chainage 5,000 feet on the 11th June 1923 and will begin on the new length about the 18th February and finish to chainage 6,450 about the middle of April.

At Colaba the rubble mound from chainage 2,000 to 5,705 was finished on the 28th August 1923, concreting on superstructure began on the 30th August and was completed on the 28th December 1923. Work on the rubble mound was renewed from chainage 5,705 feet on the 10th December, had reached chainage 7,800 feet on the 11th February 1924 and is expected to complete to chainage 11,978 feet by about the end of May, thus completing that section of rubble wall. Concreting the superstructure will not be taken in hand until towards the end of the Monsoon say the 7th September and will be finished about the end of February 1925.

The total length of wall to be executed at Marine Lines in the season *i.e.*, 1,450 feet is about half that contemplated by the Chief Engineer, as given in my report to you dated 10th January 1923 but is in accordance with the programme suggested by my firm in their letter to you dated 3rd November 1923, and I believe with your own views, as there seemed no object in pushing ahead with the wall so far in advance of the filling operations.

At Colaba the work was 795 lin. feet behind the Chief Engineer's programme for 1922-1923 and he did not propose to finish the rubble mound this year, but on my recommendation is doing so.

Cross Bunds

As explained to you in my letter dated 10th January, 1924, eight cross walls had been allowed for by the Chief Engineer in his project estimate, but the nature of the material being dredged and deposited is such that I decided we could dispense with the bunds not yet built and utilize the masonry storm water drains as bunds to divide up the area to be reclaimed into suitable sections. No. 1 Cross Bund at Colaba has been completed and was necessary as a means of communication for the trains of stone to the wall under construction and because the storm water drain in that vicinity had not been built, and it is in order to avoid having to build a similar communication wall which would have been cross bund No. 2 that the whole of the rubble mound at Colaba is being completed this season. No. 7 cross bund (Marine Lines) was put in hand last season, because it was fully expected to begin dredging operations with the " Kalu " in Back Bay before any storm water drain could be built: this expectation has unfortunately not been realized.

Storm Water Drains.

No. 1 Storm Water Drain (Colaba) is in hand and will be finished about the end of May 1924 along with the drain running North to South. No. 8 Storm Water Drain (Marine Lines) is in hand and will be finished in the current season whilst No. 7 will be well under way.

Opinion of work executed.

In my report dated 10th January, 1923, I commented adversely on several matters, notably on the size of the stone being used in the wall. I am glad to say that these defects have been remedied at Colaba, the whole of the work reflects credit on the engineer in charge, the concrete superstructure is an excellent job and the pitching of the outside slope with large stones has been carried on simultaneously with wall construction. At Marine Lines the workmanship is also substantial and well executed,

and although the pitching of the outside slope with large stones had got a little behind-hand, I am assured by the Chief Engineer that it will be completed before the advent of the Monsoon.

Dredging and Reclamation.

It has always been realised that the successful reclamation of the area enclosed by pumping through pipe lines material dredged from the sea bed is the crux of the whole scheme. I commented at length on this phase of the undertaking in my report dated 10th January, 1923, and strongly recommended the appointment of an officer experienced in dredging with the rank of a Deputy Chief Engineer. This appointment was sanctioned and Mr. Brims arrived in Bombay in the month of August 1923. There was an immense amount of work to be done and we hoped to have the dredgers " Sir George Lloyd " and " Kalu " both operating this season, but it was unfortunately impossible to get the " Kalu " ready in time. The " Sir George Lloyd " however began work on the 8th December and had up to the 7th February pumped 212 hours.

I believe I may say that the result up to date has been quite satisfactory, the material in the harbour has proved much harder than we were led to suppose, and actual reclaimed land can be seen and walked upon by any one who chooses to go to Colaba.

To pump 28,000,000 cubic yards of material through pipe lines ranging from 5,000 feet to 12,000 feet in length is however a colossal undertaking and there are bound to be many difficulties to overcome and setbacks in the execution of the work.

The present intention is to take 19 million cubic yards from the harbour side using the " Sir George Lloyd " and " Colaba " dredgers pumping through two pipe lines, and nine million cubic yards from Back Bay using the " Kalu " and possibly for a short time the " Kalu " in conjunction with the " Colaba." The full utilization of Back Bay depends on the removal of the Eastern Telegraph Coy.'s cables and my firm are at present discussing the question with the Managing Director of the Company.

I enclosed with my letter to you dated 10th January a memorandum of a conference I held with the Chief Engineer and the Deputy Chief Engineer, Dredging, and since then I have had the advantage of prolonged conferences with Mr. McMurray the representative of Messrs. Simons and Company the builders of the dredger and the Deputy Chief Engineer, Dredging, when the subject was looked at from all points of view. It may be taken as an axiom that in dredging operations of this magnitude ample skilled supervision is of the first importance and the shore men have to be specially trained on the spot. The best that can be said at present is that a good start has been made and every effort will be strained to work the dredgers both in Back Bay and the Harbour on double shifts at the end of the Monsoon.

Accounts.

I beg to invite a reference to paragraphs 33—36 in my report dated 11th February 1922, and to paragraph 10 in my report dated 10th January 1923.

I understand that accounts officers have been sanctioned and attached to the office of each Deputy Chief Engineer and I have satisfied myself, that cost accounts are being kept, and that the Deputy Chief Engineers know within certain limits what their work is costing. There has not however to my knowledge been any summary of these cost accounts or compilation in detail, against the heads of the project estimate in detail. They are therefore deprived of much of their value. I suggest that the whole work should from time to time be measured up in the way that would be done were it let by contract and the cost placed against each item, whilst in the case of the quarry, it should be considered a separate undertaking selling stone to the works, the total quarry output should correspond with the total sold to the Deputy Chief Engineers and they should be able to check their bills.

I have had very considerable experience in Engineering accounts and with your approval I should like to go into the matter on my return to Bombay after the Monsoon.

My next visit.

As you are aware I visited the works during last Monsoon and satisfied myself that under the most severe monsoon conditions we need have no fear of their stability. I propose therefore to make my next visit about the month of October or early November dependent on the date when dredging operations are renewed.

I am, Dear Sir

Yours faithfully,

(Signed) GEO. C. BUCHANAN.

Bombay, December 15th, 1924.

From

Sir GEORGE BUCHANAN, K.C.I.E.;

To

THE DIRECTOR OF DEVELOPMENT,

Bombay.

Dear Sir,

Since my last report dated 14th February 1924 on the progress made with the Back Bay Reclamation Scheme, work on the construction of the wall and the storm water drains has proceeded according to programme, the work has been well carried out and I have no remarks to make. At the end of the present season 1924-25 the Colaba Section of the wall 11,768 feet in length will be completed except the parapet, and the Marine Lines Section will be completed to 8,000 feet and the gantry to 8,100 feet leaving a gap of 1,771 feet between the Colaba scar end and the end of the gantry.

In 1925-26 it is proposed to build 1,500 feet of wall at the Marine Lines Section leaving a gap of 271 feet which will not be closed for some time as it is intended during the monsoons to house within the harbour created by the walls, the pontoons and pipes in use in Back Bay.

2. I propose in this report to review at some length the position in respect to dredging plant and dredging operations. It has always been realised that the successful reclamation of the area enclosed by the wall, by pumping through pipe lines material dredged from the sea-bed, is the crux of the entire undertaking, and I believe I am correct in saying that dredging operations on this scale have never before been attempted either is India or elsewhere.

Under these circumstances it is not surprising that there have been many difficulties to overcome and that the plan of operation has had to be changed or modified from time to time as new conditions arose.

In the first instance I will describe briefly the various plans discussed since my report dated September 1919 and thereafter I will place before you the programme of operations recommended by the Chief Engineer, the Deputy Chief Engineer, Dredging, and myself in the light of the practical experience obtained to date.

3. The proposal to obtain the material for filling in the area to be reclaimed from the sea, by dredging in the harbour and pumping the material in a fluid state across the Colaba Peninsula to Back Bay, was first considered in 1905 and the detailed survey on which the present scheme is based was prepared by Mr. Kidd in 1911 in connection with what was known as the 1912 project. In this scheme it was intended to have seven pipe lines across the Peninsula between the Harbour and Back Bay, the line farthest North being taken down Church Gate Street.

4. In my report dated September, 1919, I assumed that Mr. Kidd's borings and surveys were correct, and I accepted his conclusions both in regard to quality and quantity of material, but I reduced the number of pipe lines to three that farthest North being designed to be laid along Ormiston Street and thence across the Maidan, entering Back Bay a little to south of the Baths. On this plan the dredger " Sir George Lloyd " and intermediate booster dredger " Colaba " were ordered and designed to pump 2,000 cubic yards of soft clay per hour through 10,000 lineal feet of pipe line.

About the same time the Bombay Government purchased the cutter suction dredger " Kalu "; I believe with special reference to the East Colaba Reclamation Scheme, but the dredger was, on the creation of the Development Directorate, handed over to that Department for general service. The " Sir George Lloyd " arrived in Bombay on the 30th March, 1922, and the " Colaba " on the 20th April, 1922. The delivery of pipes and pontoons began at the end of October, 1921, and by the end of 1922, erection had been completed and the plant was ready to begin operations.

5. In April, 1921, we had sent the Chief Engineer a proposed programme of dredging operations accompanied by a plan No. 3244. We showed on the plan three pipe lines across the Colaba Peninsula, but had shifted the pipe line running along Ormiston Street to a line in the vicinity of Arthur Basin so as to avoid opening up an important public thoroughfare.

We realised that to reach the farthest points of the reclamation the distance of 5,000 feet from the intermediate pumping station " Colaba " would be exceeded, and that it might be necessary to install an additional land booster, but we wished, if possible, to avoid this complication by pumping through the longer line although the output would be diminshed.

6. In May, 1921, the Chief Engineer in letters to us raised the question as to the suitability of the material in the harbour for reclamation purposes, he said it had been very favourably reported on by experts, and he discussed the possibility of obtaining more suitable material in Back Bay. In our letters dated the 22nd June, and the 2nd July, 1921, we quoted the specific statements on the subject made by Mr. Kidd in

his report dated the 3rd August, 1912, and said that we were unable to accept, without much more imformation, the pessimistic reports as to the unsuitability of the material in the harbour, and that it was impossible to come to any conclusion until a dredger had been actually at work for some time on the spot. With reference to dredging in Back Bay we advocated taking borings in the northern section of the Bay, as if there were sufficient soft material to warrant the " Kalu " being put to work, it would be easier and cheaper to reclaim the northern area of the land to be reclaimed by that means than by taking it from the harbour.

7. In September, 1921, we received a letter from the Chief Engineer informing us that the Port Trust and the Director of Indian Marine had raised objections to the dredging of the bed of the harbour in the neighbourhood of the Ballard Pier and Middle ground, and he enclosed a plan showing the revised limits for dredging operations. This reduction in area deprived us of some 15 million cubic yards of material which according to the borings was good clay, and to equalize matters the Chief Engineer had arranged to go farther into the harbour in a South Easterly direction.

8. I visited Bombay in the latter part of 1921 and in my report to you dated 11th February, 1922, I said that although it was impossible to fix definitely a date for starting dredging, I believed it should be practicable to do so towards the end of 1922, and I recommended the early laying of the first pipe line across the Peninsula and the erection of the floating pipe line. In October, 1922, the Chief Engineer submitted his detailed project estimate for the whole scheme and in the covering report he indicated the possibility of obtaining all the material required for the Reclamation from Back Bay itself, and he fixed the date for beginning dredging at one place or the other, for the season 1924-25.

9. In November 1922 I again visited Bombay and was accompanied by Mr. W. T. Halcrow (now a member of my firm). The Chief Engineer had been proceeding with his investigations in Back Bay since my last visit, and on the 8th of December 1922 I convened a conference on the subject of dredging at which were present the Chief Engineer (Mr. Lewis), Mr. Halcrow, Mr. McMurray of Messrs. Simons and Company, and myself. During the conference the Chief Engineer again expressed his fears about the suitability of the material in the harbour for reclamation purposes, and proposed to abandon the harbour and reclaim the whole area from Back Bay; but we pointed out that such a deviation from the original sanctioned project required very grave consideration and that the first thing to do was to ascertain the precise nature of the material in the harbour by a practical test, with a grab or other dredger which was agreed. I also pointed out that the Chief Engineer's programme of work, which did not contemplate beginning dredging until 1924-1925, was not in accordance with our views, which were, that by getting the first pipe line at Colaba laid as soon as possible and completing other preliminary work there should be no difficulty in beginning dredging not later than the end of 1923 monsoon.

10. The result of our deliberations was explained to you in my report dated 10th January 1923, when I said that although I should welcome a supply of good material from Back Bay, I doubted, from the nature of the borings already taken, whether there would be a sufficient depth of dredgable sand and clay in Back Bay to warrant the use of the large dredger, and, whilst agreeing that full investigations should be made in Back Bay area, I was averse to delaying the arrangements already made for dredging from the harbour. I pointed out that dredging in Back Bay involved considerations of navigation, of dredging craft, the effect the deepening of the sea bed might have in increasing wave action, and the best method of dealing with the Eastern Telegraph Company's cables, which traversed the area over which it was proposed to dredge, and I further observed that in our programme we had fixed the date for beginning dredging and filling at Colaba for December 1922, and I still consider it should have been possible to commence dredging that season, if however, no action was taken in laying the first pipe line until all the borings in Back Bay had been made, I was afraid that another season might pass without getting the large dredger to work. I recommended that very early action be taken in putting the dredger " Kalu " into working order and arranging for any additional pipe line required, and lastly I recommended the early appointment of a Deputy Chief Engineer, Dredging, to take entire charge of dredging operations, if an officer with the necessary experience could be obtained.

The laying of the first pipe line at Colaba was put in hand in September 1923 and completed in November 1923. The repairs to the " Kalu " were begun in May 1923 and completed September 1924, and the Deputy Chief Engineer, Dredging, was appointed and arrived in Bombay in August 1923.

11. On the 23rd March 1923 the Chief Engineer sent us a statement showing the results of the borings taken in Back Bay during the year, which showed an average depth of 14·18 feet of dredgable material over the area tested, and on the 3rd May 1923 we addressed the Chief Engineer on the subject, and said that with regard to the general

dredging programme we had prepared a scheme on the assumption that an effort would be made to put both dredgers into commission after the monsoon. Our letter was accompanied by plan No. 3411, and we showed the " Kalu " working in Back Bay in conjunction with the " Colaba," and the " Sir George Lloyd " working in the harbour alone on her own pipe line. We hoped that the " Kalu " and " Colaba " would during the season remove a great deal of the material in Back Bay farthest away from the wall, and that the following season the " Kalu " would operate with her own pipe line only, leaving the " Colaba " free to work in the harbour with the " Sir George Lloyd."

Our letter crossed a letter dated 7th May 1923 from the Chief Engineer in which he gave us the final result of the borings in Back Bay showing that in area A, a volume of 25,333,000 cubic yards of material were available or more than the total required for the whole reclamation.

Mr. Lewis remarked that the material was decidedly good and much more suitable for filling than the material in harbour. He thought the use of this material was clearly indicated, and asked for the opinion on the matter so that arrangements could be made as soon as possible for the next year's work. In acknowledging receipt of this letter on the 21st June 1923, we said that as I was leaving Bombay the following week the matter could be discussed with me on the spot.

12. I arrived in Bombay during the second week in July 1923. By that time the experimental dredging in the harbour had been carried out, and, so far as one could judge, the silt and clay was perfectly suitable for reclamation purposes, so much so that after consideration and several conferences, I wrote to the Chief Engineer on the 26th July and said it was understood that the scheme put forward in our letter dated 3rd July 1923, and shown on drawing No. 3411, would be adopted, and we hoped both dredgers would do good work in the coming season. I wrote to you on the 9th August confirming this arrangement, and said that the most important matter now was to get the dredgers started, and that the alteration I had made in the position of the Colaba cross bund should enable the " Sir George Lloyd " to begin operations some time in November.

13. I left Bombay on the 11th August 1923 and on the 3rd November we sent you a programme of operations on the assumption that the " Sir George Lloyd " would work in the harbour and the " Kalu " in Back Bay, and the " Colaba " partly with the " Sir George Lloyd " and partly with " Kalu," and we remarked that work in Back Bay would be subject to satisfactory arrangements being made with the Eastern Telegraph Company for the removal of their cables, that negotiations were in progress, but that it was matter for regret this matter had not been taken up many months ago.

14. I returned to Bombay in December 1923 and the dredger " Sir George Lloyd " had begun to work in the harbour on the 8th December 1923, but unfortunately the repairs to the " Kalu " were still incomplete, also the pipe line had not arrived from England, so that it was impossible to do any work in Back Bay.

At a conference on dredging operations held in the Chief Engineer's office on the 9th January, the following conclusions were arrived at.

(1) It will not be practicable, so far as one can see to work the " Sir George Lloyd " on double shift this season, or do any work with the " Kalu," but every effort must be made to work both dredgers on continual double shift next season.

(2) The proposed pipe line through the B. B. and C. I. Railway yard near Woodhouse bridge, or alternatively down Ormiston Street involves such an immense amount of costly and difficult work that all idea of a pipe line in that vicinity should be abandoned. Ample material for the reclamation can be obtained from the harbour and Back Bay combined, without dredging from the Northern side of the harbour area. It is proposed to fill areas 1 and 2, *i.e.*, to near storm water drain No. 4 from the harbour pumping through pipe lines, Nos. 1 and 3, and the remaining area from Back Bay in which connection it will be advisable to remove the Telegraph Company's cables.

In forwarding the findings of the conference to you I observed in a covering letter dated 10th January 1924, that after the grave doubts which had been expressed at various times as to the suitability of the material in the bed of the harbour for reclamation purposes, it was an agreeable surprise to see that what was being pumped consisted largely of a hard compact clay with which we had reason to be quite satisfied. I also stated that in view of the nature of the material, I felt justified in dispensing with the stone cross bunds, which would effect a considerable saving.

15. On the 31st January, 1924, my partner Mr. Halcrow, interviewed Admiral Grant the Managing Director of the Eastern Telegraph Company in London, with respect to the moving of the cables in Back Bay, and after considerable negotiations and correspondence, it was agreed that the dredger " Kalu " should begin operations in Back Bay on the area North of the existing cables, and when dredging was completed in that area, the Company would lay new twin core shore cables across that area. The existing cables would then have to be removed and the dredger work over that area.

16. On the 2nd May 1924, the Chief Engineer addressed us at some length on the subject of dredging plant and dredging operations. He sent us a plan of operations showing the proposed locality in the harbour for the " Sir George Lloyd " and " Colaba " in 1924-25, and proposed that the " Kalu " should also work in the harbour pumping through pipe line No. 3 instead of in Back Bay, his reason being that the negotiations with the Eastern Telegraph Company on the subject of shifting the cable would not be finished in time to allow of the " Kalu " proceeding to Back Bay until the season was well advanced, and that she would not do much more than dig the approach channel and the Bell mouth by the end of the season. He also recommended the purchase of additional floating and short pipes and the installation of an intermediate pumping station to work with the " Kalu " in Back Bay. For this purpose he suggested that it might be possible to purchase the " Jinga " and plant the engines, boilers and pump on a barge or pontoon. In our reply dated 5th June 1924, we accepted the position of the " Sir George Lloyd " and " Colaba " for 1924-25, but adhered to our opinion that whatever the future decision respecting the cables in Back Bay, the " Kalu " should begin work in Back Bay operating in the area North of the cables and in order that the work might be begun without an Intermediate Station, we recommended that the " Kalu " should be taken in at high water to the nearest point to the new wall, where she would either dredge a hole for her own flotation or float in a hole already prepared by another dredger. This scheme had the advantage over the previous one that as soon as the hole was dredged the " Kalu " could begin actual reclamation, whereas in the former proposal she would have been occupied the greater part of the season in digging the approach channel and Bell mouth.

In the matter of the pipes we recommended the purchase of an additional 1,000 feet of 42 inches floating pipe line and 5,500 feet of shore pipe line which was less than the Chief Engineer had asked for and we suggested the whole subject might be discussed with me on my next visit to Bombay.

With reference to the Intermediate Booster Station for the " Kalu " we suggested that before taking any action the possibility of using an electrically worked pump should be investigated, as being probably cheaper both as regards capital cost and the working expenses.

17. In order that there might be no misunderstanding on the subject we wrote to the Chief Engineer on the 11th September, 1924, saying that as dredging and reclamation operations were shortly to be resumed we understood that the programme of work arranged for the next working season was as follows :—

(1) The " Sir George Lloyd " to commence dredging at the south-eastern extremity of the Harbour area limits in conjunction with the " Colaba " and discharging through pipe line No. 1 to reclaim the area south of storm water drain No. 1.

(2) The " Kalu " to commence dredging within the dredging area limits north of the Eastern Telegraph Company's cables in Back Bay and reclaim the northern corner of the Back Bay Reclamation.

18. Every preparation was made to begin dredging operations at the earliest possible date for this season's work. It was impossible to dredge the basin for the " Colaba " last season as the floatng pipe line in operation with the " Sir George Lloyd " crossed the site, but negotiations with the Royal Indian Marine for the hire of the bucket dredger " Cachalot " to dredge the basin were begun in May 1924, and it was arranged to commence operations about the middle of September 1924. Dredging was actually begun on the 20th September, which was the first day the weather was sufficiently calm, but on the 27th September the vessel sprang a leak on the port side of the ladder well, and had to dry dock for examination and repair. The " Cachalot " resumed work on Friday the 3rd October, after a delay of a week and on the 9th October, the officials of the R.I.M. decided the material was too hard to be dredged by their vessel and withdrew the " Cachalot " from the work.

The whole time Priestman Grab was then put on, but without satisfactory result and finally arrangements were made with the Port Trust for the use of their Dipper dredger and she commenced work on the 31st October and finished on the 17th November, but on the same evening broke her after spud and did not get clear of the berth until the 19th November. These delays in getting the basin dredged for the " Colaba " amounted in all to 27 days. The " Colaba " which has been lying at anchor in deep water in the vicinity of the new basin, was brought in and moored in position on Thursday the 20th November, and a start made the same day connecting up the pontoons to the shore and on the 21st November work was put in hand connecting the pontoons between the " Colaba " and the " Sir George Lloyd ", which had been moored in position ready to commence work since the 13th October.

Ordinarily the connecting of the pontoons would have been completed in the course of about two weeks, but in spite of the fact that owing to the experience of strong ebb tides last season a number of additional moorings had been provided on the pontoons, they were not sufficient, the anchors dragged and the whole line had to be replaced, a slow and tedious operation. Additional 30 cwt. anchors were obtained as soon as possible and dredging proper was begun on the morning of the 6th December.

19. The delay in beginning actual operations amounts to four weeks which is a serious matter, but speaking with full knowledge, as I have been here all the time, I can say that I am satisfied that the dredging department personnel have done all that is humanly possible to get on with the work. As I have already pointed out, dredging operations on this scale have never before been attempted and difficulties occur which it is impossible to foresee. It is of the very first importance to take every precaution to avoid any breaking of the pipe line during pumping as if such occurred close to the bow of the " Colaba " when she was pumping full pressure, the consequences might be most serious.

It is also of paramount importance to maintain instantaneous communication between the " Sir George Lloyd " and the " Colaba " which are separated one mile from each other and to that end not only is there a telephone which must be maintained in perfect order, but alternative signalling arrangements have been arranged in case the telephone breaks down.

20. As already explained the arrangement for the " Kalu " was, to go into Back Bay and, after digging a hole for her own flotation, proceed with her own pipe line to dredge the area north of the cables. We had hoped that she would be able to rest on the sea bed during the period of Low Water, as she had done when employed upon the Sewree Reclamation, but the Deputy Chief Engineer, Dredging, considered the bottom too hard, and that there was some risk to the vessel involved, so that she had to be moored in deep water, go in at High Water and retire in time to get back to her base before grounding. Once the hole is completed she will dredge continuously. Operations were commenced by the dredger " Kalu " working tide work on the 28th November, and the reason she could not begin sooner was that the men were not yet trained and it was impossible to spare earlier the Senior Dredging Master, who was fully occupied in the harbour. The " Kalu " worked until the afternoon of the 1st December when operations had to cease owing to neap tides, and she resumed again on the 10th December, and had again to suspend on the 14th December. The material met with has proved to be very stiff, and in addition heavy swells have been experienced, making it extremely difficult to connect the stern pipe of the dredger to the first pontoon, this operation alone on several days taking as long as one hour over and above the time required for getting into position and picking up moorings.

21. The foregoing brings the history of the discussions and negotiations in respect to dredging plant and dredging operations up to date, and I have thought it desirable to describe them at some length so that this report may contain a complete record of what has occurred. I arrived in Bombay on the 24th October, 1924, and have spent most of my time working out, in consultation with the Chief Engineer and Deputy Chief Engineer, Dredging, what we hope may prove a final and complete programme which I will now describe.

22. *Quantity of material required and locality from which it is to be dredged.*— Twenty-eight million cubic yards of material is the total amount required for filling the area to be reclaimed, and it was originally intended to obtain the whole of the amount from the harbour.

This has now been found to be impracticable, partly on account of the curtailment of the original area by the Port Trust, and partly the unforseen great difficulties and expense in laying the pipe lines across the Peninsula. The accompanying plan shows the area from which it is now proposed to dredge the material, and the following statement gives the figures in detail.

Available in Harbour.

	Cubic Yards.
Material available in area hatched red on plan	14,364,000
On the assumption that 75 per cent. of the material available is pumped ashore and remains in the reclamation. 75 per cent. of 14,364,000 ...	10,773,000
It is proposed to fill from the Harbour the area in Back Bay from Colaba point up to storm water drain No. 4	14,145,000
Amount available in area hatched red	10,773,000
Balance	3,372,000

This balance will be obtained by either dredging further out into the Harbour or in the enclosed but uncoloured area.

Available in Back Bay.

	Cubic Yards.
Material available North of cables on area hatched red	7,345,000
Material available South of cables and area occupied by cables on area hatched blue	7,750,000
Total	15,095,000
Take 75 per cent. as being the probable amount pumped and remaining in the reclamation	11,321,250
It is proposed to fill from Back Bay the whole of the area from Storm Water Drain No. 4 Northwards	12,733,000
Amount available	11,321,250
Balance	1,411,750

This balance will be obtained by dredging South of the coloured area.

Output of Dredgers.

23. The " Sir George Lloyd " and " Colaba " were designed to discharge 2,000 cubic yards of soft clay per hour through 10,000 feet of 42 inch pipes. Last season the material actually dealt with was not soft clay but silt and stiff clay with some sand and stones which although much better than soft clay from the point of view of suitable material for reclamation is heavier and more difficult to pass through the pipe line.

Until considerably more work has been done it is impossible to say of what the bulk of the material to be dredged will consist, but I think it is safe to assume that we shall not get to the full output of 2,000 cubic yards per hour, and that fact must be faced. If we get two-thirds of the estimated total output we shall be doing well, but naturally the time required to complete the work, and the cost of pumping, will be increased.

Dredging Plant.

24. The sanctioned project estimate was on the assumption that there would be three pipe lines across the Colaba Peninsula and that the whole of the material would be obtained from the harbour, the use of Back Bay as a source of supply being noted in the Chief Engineer's report as a possibility. The dredger " Kalu " was added to the plant specially purchased for the work, and it was stated she would be used either in connection with the " Sir George Lloyd " or independently, as might be found desirable, and 2,500 feet of floating pipe line was provided.

On the programme outlined in this report it is obvious that more floating pipe line is required to enable the " Sir George Lloyd " to reach the farthest points of the dredging area, and in actual practice it was found that insufficient shore pipe line had been provided to enable the material to be promptly distributed through various branches without causing delays to the dredger. The combined length of floating pipe line and the shore pipe line will at the greatest aggregate 12,000 feet, or even more, and as, theoretically, the plant is only calculated to pump 10,000 feet it has been a subject of consideration whether an additional booster on shore would be necessary. On the one hand there is the additional capital cost of the shore booster combined with the difficulty of working a line with three independent pumps on one pipe line, and on the other the disadvantage that with a pipe line much exceeding 10,000 feet in length the output per hour will be correspondingly reduced. Taking everything into consideration we are all agreed that the latter alternative is the most suitable, especially as the very long pipe line does not apply to the whole of the work.

25. In Back Bay for work in conjunction with the " Kalu " an Intermediate Boosting station is an absolute necessity, and we obtained a quotation from Messrs. Simons & Co. for a complete plant the cost of which delivered in Bombay amounts to Rs. 25,00,000, but we think a plant can be contrived at a much cheaper rate, and we recommend that negotiations be opened for purchase of the " Jinga " subject to inspection of the machinery by a competent Marine Engineer. Assuming that the inspection is satisfactory, and that the " Jinga " can be purchased for not exceeding £12,000, we estimate the complete booster plant should be installed for not exceeding Rs. 10,00,000.

Staff.

26. The vital importance on a work of such magnitude of an adequate and competent staff is not generally realised. When I arrived in Bombay last year I found the working of the dredger " Sir George Lloyd " dependent on the health and energy of one man, and if he had fallen sick the dredger would have had to suspend operations. I represented the matter to you and immediate measures were taken to obtain from

home an Assistant Dredging Master. I am disposed to think we still have, to use a homely simile, " Too many eggs in one basket." Last September Mr. Speirs, the Dredging Superintendent, was home on leave, and was ordered to pass a medical examination before he returned to Bombay. He was definitely rejected by the Medical Board, and had it not been for our urgent representations to the High Commissioner, who passed the case on to you, he would not have been allowed to come out, in which case dredging operations would have been very gravely delayed, because we have no other man with such practical knowledge of suction cutter dredgers. The new men are all inexperienced in this class of work, and are being trained by the Deputy Chief Engineer, Dredging, and the Dredging Superintendent, but we have no understudy to the Dredging Superintendent, and I think the necessity for such should be considered.

Summary.

27. It will be convenient now to summarize the position.

(1) It was originally proposed to obtain the whole of the material for the reclamation from the harbour, and for that purpose the " Sir George Lloyd " dredger and the " Colaba " Intermediate pumping station were purchased. It was estimated that this plant, operating for 170 days per annum and working 15 hours a day, would deal with 5 million cubic yards per annum, and that the work of the dredgers would be completed in six years from beginning of dredging operations.

(2) Owing to the curtailment of the area in the harbour plus the difficulties of laying pipe lines across the Peninsula it is necessary to go to Back Bay for a portion of the material, and the proposal now is to take 14½ million cubic yards from the harbour and 13 million cubic yards from Back Bay.

(3) The dredger " Kalu " has been purchased and placed into thorough repair and has cost along with her pipe line Rs. 23,63,367. It is proposed to utilize her for the work in Back Bay, but, without an intermediate boosting station, the " Kalu " can do but little; she could dredge up to near the 4,000 feet line in the area hatched red on the plan but could do nothing in the blue area until the Eastern Telegraph Company's cables have been removed, and they cannot be touched until the whole of the red area has been dredged.

(4) The " Sir George Lloyd " cannot herself work to advantage in Back Bay as she is not built for shallow dredging, but the " Colaba " could work in conjunction with the " Kalu " were she not required to work in the harbour with the " Sir George Lloyd ".

(5) It is improbable, with the class of material now being taken from the harbour, that the " Sir George Lloyd " will do her estimated output of 5 million cubic yards per annum. The total quantity to be dredged is 14,145,000 cubic yards and the time required may be put at, say, 6 years.

(6) If the " Kalu " and a new booster worked simultaneously with the " Sir George Lloyd " and the " Colaba " the whole of the reclamation should be completed in 6 years from the present time.

(7) The alternative procedure, on the assumption that it is decided to use the " Colaba " in Back Bay thus saving the capital cost of the new booster, will be to let the " Kalu " work on her own pipe line for the remainder of this season, and possibly the greater part of next season, and then lay her up until the " Colaba " is available, but this would probably prolong the completion of the work by about 5 years.

(8) On full consideration of all the circumstances I strongly recommend that the programme now submitted be approved, and that sanction be accorded to the purchase of the " Jinga " for conversion into an intermediate pumping station for use with the " Kalu " if after inspection she is proved to be fit for the work and can be obtained at a moderate price, as from all points of view this seems to be the most economic procedure.

Revised Project Estimate.

28. A revised project estimate for the whole work was submitted by Mr. Lewis, the then Chief Engineer, in July last, and was sent to us for our remarks, when we replied that the matter would be taken up by me on my return to Bombay.

The sanctioned project estimate amounted to Rs. 7,02,43,321, and the revised estimate Rs. 7,26,54,401, an excess of Rs. 24,11,080.

There have been material savings in several directions notably in the sea walls and cross walls, and the principal excesses are on dredging plant, dredging and filling, works maintenance, medical and sanitary work and unforeseen charges.

I have gone into the matter very carefully with the Chief Engineer and understand he wishes to submit his revised estimate after the receipt of actuals at the end of the financial year.

So far as I can see Mr. Lewis's figures are generally acceptable, except that the cost of dredging and filling must be an uncertain quantity until we have had experience of this season's work, and that in any case there must be added the sum of 3½ lakhs for removal of cables in Back Bay, and to dredging plant 5 lakhs for the intermediate pumping station to work the " Kalu " if that is approved, Mr. Lewis having already allowed 5 lakhs.

I have asked the Chief Engineer kindly to prepare at once a revised estimate for dredging plant, with an explanatory note of the excesses and final proposals.

I am, Dear Sir,
Yours faithfully,
(Signed) GEO. C. BUCHANAN.

V.—STATEMENT SHOWING THE TOTAL EXPENDITURE ON THE RECLAMATION UP TO JUNE 30TH, 1926.*

Project Item No.	Project heads.	Estimated Provision.	Actual Expenditure. To end of 1924-25.	Actual Expenditure. During 1925-26.	Actual Expenditure. During 1926-27.	Total.

XIII	Murum filling	31.36.712	—	17.018	—	17.018
XIV	Equipment of area with drains and lights.	1.19.95.762	—	—	—	—
XV	Equipment of area with drains.	27.66,750	—	—	—	—
XVI	Storm water drains—					
	(1) Marine lines section	64.28.100	4.37.193	2.55.548	40.552	7.33.293
	(2) Colaba section ...		12.12.170	4.14.089	—	16.26.259
	(3) Kandivlee ...		1.63.087	6.309	—	1.69.396
	Carried forward ...	6.98.45.833	3.53.97.086	43.96.990	5.29.465	4.02.60.813

* NOTE.—These figures are published as received by the Committee. They are not, however, arithmetically correct. For instance : the total given for machinery and buildings, Kandivlee (item VC) is arrived at by subtracting Rs. 17.885 from Rs. 27.38.644, whereas these two sums should have been added together. Further, the total expenditure to the end of June, 1926, excluding interest, is given as Rs. 4.72.06.841, whereas Statement VI states the expenditure over the same period to be Rs. 4.68.05.764. The latter sum appears to be the correct one.

Block No. 1	29,88,480
Total amount to complete	4,53,16,955
Add Establishment charges at 12 per cent.	54,38,035
	5,07,54,990
Add 5 per cent. for contingences	25,37,750
	5,32,92,740
Add total expenditure to 30th June, 1926	4,68,05,764*
	10,00,98,504
Or say Rs.	10,00,98,500

(Signed) H. A. ELGEE,
Chief Engineer,
Back Bay Reclamation Scheme.

* See footnote to Statement V, page 37.

Notes on estimate for the completion of the Back Bay Reclamation Scheme.

Block No. 8.—It is proposed to complete the filling with moorum dry filling.

Block No. 7.—To be completed by dredged filling from the Harbour and moorum dry fillling.

Block No. 6.—As above.

Block No. 5.—As above.

Block No. 4.—To be completed by dredged filling from the Harbour and moorum dry filling. As the area cannot be entirely filled by dredging, one quarter of the filling required, after the sealing of the wall and moorum topping are deducted, is taken as moorum dry filling.

Block No. 3.—To be completed by moorum dry filling only.

Block No. 2.—To be completed by dredged filling from Back Bay and moorum dry filling.

Block No. 1.—To be completed by dredged filling from Back Bay and filling by motor lorries.

Bunds.—Where dredgings are to be deposited the rubble mound will be sealed with moorum dry filling. The Cross Bunds, in the first instance, will be tipped to a top width of 30 feet and after dredging has been stopped will be widened out to a top width of 120 feet.

VII.—SIR GEORGE CURTIS' REPLIES TO THE QUESTIONS ADDRESSED TO HIM BY THE COMMITTEE.

Q. 1.—On 3rd August, 1920 (the date of the announcement of the creation of the Development Directorate), what position did you hold in the Government of Bombay?

Q. 2.—For how long had you held this position?

Q. 3.—When did you leave India?

Q. 4.—Were you the Member in Charge of the Development Directorate, and if so, over what period?

A. 1, 2, 3 and 4.—I was Member of the Bombay Executive Council from 16th April, 1916, to 16th April, 1921. I had charge throughout that period of what was known as the Development Department, which was concerned with questions affecting the Development of Bombay, which did not include the Back Bay Reclamation Scheme. This was dealt with in the Public Works Department, of which His Excellency the Governor had charge. The Development Directorate was constituted on 2nd November, 1920, as far as I can remember. I was in charge of it until the end of December, 1920. I doubt, however, whether during these two months papers relating to the reclamation were dealt with by the Development Directorate; at any rate, no decision of any importance was arrived at.

I left India on 21st April, 1921.

Q. 5.—Give as nearly as possible the date on which you first learnt that the Government of Bombay proposed to re-examine the question of the reclamation of Back Bay?

Q. 6.—How and from whom did you so learn it?

A. 5 and 6.—I first heard of the proposal to re-examine the Reclamation scheme in 1909. I was then Survey Commissioner engaged on a scheme to re-map Bombay Island, and I remember Mr. W. L. Cameron, then chief engineer, mentioning the project to reclaim and emphasising the importance to the engineers of an up-to-date map which would show accurately the littoral and other important areas. In spite of opposition the survey scheme went through, and the result has been the existing map. At the end of 1912, I think, I remember Lord Sydenham's Government placing before the Legislative Council Mr. Kidd's report with a sketch of the Reclamation proposed. I read the report, but, as I was then a mofussil officer, I did not pay much attention to it. In 1914 or 1915, when I was Chief Secretary, I remember Mr Kemball, then Chief Engineer, trying to arrange a meeting between myself and Mr. Kidd, who was then in Bombay, with a view to a consideration of the Reclamation project. Mr. Kemball stated that Mr. Kidd was an engineer of the highest qualifications and that in his opinion the scheme was feasible and "had to come." In 1916 and 1917 I became aware that there were two big syndicates backed by Indian capital, as well as two English

firms, who were endeavouring to obtain the concession to reclaim. Having been familiar from my youth with the history and financial results of the first Back Bay Company, I was very unwilling to grant a concession to any private firm, and I was intensely relieved on my return from leave in September, 1918, to learn from my colleague, Sir Ibrahim Rahimtulla, that his proposal to have the project re-examined by a competent engineer on Government behalf had been accepted. My next recollection of the scheme is of a conversation with Sir Claude Hill in April, 1919, and the appearance on the scene of Sir George Buchanan.

Q. 7.—Between the period 16th December, 1918 (the date of Lord Lloyd's arrival), and the 31st May, 1919 (the date of Sir George Buchanan's departure from India), did you have any, and what, conversations or consultations with :—

(1) Lord Lloyd.
(2) Sir George Buchanan.
(3) Any other and what members of Government.
(4) Any and what officers of Government subordinate to you.
(5) Any and what official or officials of the Port Trust and Royal Indian Marine.
(6) Any and what officials of the Public Works Department relating to—
(*a*) the feasibility of the scheme;
(*b*) the expediency of undertaking the work at the prices of material, plant and labour then prevailing,
(*c*) or on some other and what cognate subject?

Please answer specifically in relation to each and all of the person or persons, officials or public bodies above mentioned.

A. 7.—As regards conversations with the persons mentioned in your question, I must ask the Committee to remember that the period from January, 1919, to June, 1919, was one of the most anxious periods for the British Government in India since the Mutiny, that I was the member of Council primarily responsible for the maintenance of law and order, and in that capacity I passed through a most trying time. To make matters worse, there was a bad epidemic of influenza at Mahabaleshwar in May, which laid low my colleague, Sir George Carmichael, the Chief Secretary, Mr. Mead, and my own Secretary, Mr. Thomas. I had stayed in Bombay in order that in the event of trouble there should be someone on the spot; so I escaped. But for most of the month I was doing three men's work. Consequently I find myself quite unable at this distance of time to recall conversations with individuals, with the exceptions to which I refer below. Further, it must be remembered that except as member of the Government I had no direct concern with the Reclamation Scheme. My own task—a very difficult one—was to evolve a scheme for the adequate housing of 200,000 of the working classes and to elaborate projects for the development of Bombay City which would do away with the appalling overcrowding, which was the cause of so much disease and misery. At the risk of seeming egotistical, I would add that every one from the Secretary of State downwards looked to me to accomplish this task. The "Times of India" went so far in 1918 as to make unflattering comparisons between the expectations based on my reputation as an active mofussil officer and the poorness of my performance in Bombay. Consequently I am compelled to admit that the Reclamation scheme did not occupy the first place in my thoughts. As Mr. Kemball had said, the Reclamation "had to come." Three Chief Engineers, as well as Mr. Kidd, had pronounced the project feasible, and from an intimate knowledge of land values I was certain then, as I am certain now, that all land in the first six blocks would fetch at least fifty rupees a square yard. Provided, therefore, the Engineer was competent, there was no possible ground on which the scheme could be opposed.

The exceptions to which I refer are the following :—

(1) This conversation was with Lord Lloyd.

I must premise that when I took charge of "Development" I was handed by my predecessor Sir William Sheppard a thick volume containing the evidence recorded before a committee convened by Sir Claude Hill to consider the Development of Bombay. The Committee was remarkable in that nearly every one who was anybody in Bombay was either a member or a witness; for instance, Sir Stanley Reed, Sir Ibrahim Rahimtulla, Sir Pherozsha Mehta were members: Sir Lawless Hepper was a witness. This committee, in due course, submitted a report at the beginning of which they remarked that the first question to be settled by them, on which all others depended, was whether Colaba station was to be retained or not. They answered this question in the affirmative. I held and hold the opposite opinion. Leaving on one side historical considerations, as well as those of the convenience of the travelling public, I felt that from the point of view of the Reclamation this question was one of crucial importance. Here, I reflected, was Bombay about to spend five millions sterling on a reclamation,

to which the only access from the business quarter as regards two-thirds of the land was by the level crossing at Church Gate Station, a crossing which, as the line came to be electrified, and the trains are frequent, must of necessity be closed to traffic for thirty minutes in the hour. Consequently I determined, as my contribution to the reclamation, to devote my energies to the removal of Colaba. I was encouraged in this course by the discovery, on closely examining the surroundings of the station, that its removal would make available an area which, when combined with the Cotton Green and other vacant spaces and the small reclamation on the East of the military area (see paragraph 21 of Mr. Kidd's report), could be developed into a most attractive high-class residential area (for detailed lay-out please see the plans and project prepared by Mr. Mirams).

The result of this was that when Lord Lloyd arrived I took him on his first trip, not to the classic slum areas, to which Lord Sandhurst, Lord Northcote, Lord Lamington, Lord Sydenham and Lord Willingdon had always been conducted, but to Colaba Station, the Cotton Green, the disused docks to the south of this, and to the site at which the small reclamation was projected by Mr. Kidd. Eventually, as a result of the visit, he agreed to support me in my struggle to remove Colaba, and it is pleasing to think that its contemplated removal has since received the approval of every section of the public. But the station was not the only the feature which attracted our attention. The small reclamation was obviously an easy scheme to carry through, and when combined with the vacant areas existing it might provide the additional land for which the public were clamouring in a minimum of time without any great expense. Consequently, somewhere in April, after the consideration of the big Reclamation scheme, I was summoned to Lord Lloyd's Office in order to discuss the smaller scheme with him and Sir George Buchanan.

(2) Conversation with Lord Lloyd and Sir George Buchanan.

I must remark that I did not as a rule take part in discussions of this nature because the Reclamation was not my subject; also that at the time I was so busy with my own immediate duty of keeping the peace and controlling the forces that made for disorder that Lord Lloyd and my colleagues kindly spared me as much as possible. But on this occasion I was present because the development of the eastern side of Colaba was my pet project. After the discussion, I remember that Lord Lloyd asked Sir George Buchanan whether, in the event of Government deciding to proceed at once with the smaller reclamation scheme, it would be possible to procure a small dredger without delay at a reasonable price. Sir George, if I remember right, replied that he had just been working in Mesopotamia with several dredgers, that these would shortly be for sale, and that it would be easy to procure a small dredger, which would be useful for the small reclamation and for general work. He promised to communicate with the Admiralty and let us know his views. His letter to my address, dated 24th September was, I think, it may be inferred, the result of this conversation. It was the only letter which I ever received from him, just as the conversation was the only one which I ever had with him. Consequently the purchase of this dredger was the direct result of his recommendation.

I notice in your questionnaire that you ask whether I had any conversation with the officers of the Royal Indian Marine on the subject of the Reclamation. The question puzzles me, because I cannot conceive what rights or responsibilities the Royal Indian Marine can have had outside their own dockyard. In any case they were (they have since been abolished) an Imperial Department who prided themselves on the fact that they were independent of the local Government and it was for the Government of India to see that their privileges were not infringed.

Q. 8.—Between the period 31st May, 1919, and 3rd August, 1920, did you have any, and what, conversations, of the kind referred to in the preceding question with all or some, and which of the persons or public bodies set out in the preceding question?

Please deal with each person or group of persons, or public bodies specifically.

A. 8.—I find it impossible to recall with any definiteness conversations which occurred seven years ago, except in the following cases:

I had an interview with the Viceroy, Lord Chelmsford, at which Lord Lloyd was present, in July, 1919. On this occasion the question of Bombay Development was discussed and the Reclamation was mentioned. But the Viceroy laid special stress on the urgent necessity of evolving some scheme for industrial housing and the orderly development of the city in order to enable the lower classes of the population to obtain decent habitations at a reasonable price. I had received a similar admonition from the Secretary of State personally in 1918. This was followed by an interview with certain members of the Government of India, at which the principal matter discussed was whether Colaba Station should be retained. It was decided to transfer the terminus to Grant Road, and to notify accordingly.

In August I had an interview with the most prominent mill-owners of Bombay in order to discuss various schemes for constructing industrial tenements as a co-operative or contributory basis. In the course of the discussion the plan was evolved (which was eventually adopted), of constructing these tenements by departmental agency and financing it by the levy of a town duty of one rupee per bale on raw cotton.

In August Mr. Lewis arrived on his way home and after inspection informed me that he did not consider that the Reclamation offered any difficulties.

Apart from these conversations I frequently discussed the Reclamation with my colleagues and subordinates as well as officers of other departments and members of the public. There was no question of any secrecy about the plans. I have never heard any doubts raised as to the feasibility of the work or the reasonableness of the estimates.

Note 1.

As regards your question concerning my conversations on the subject of the feasibility and cost of the reclamation between June, 1919, and August, 1920, it seems to me that the Committee are under some misapprehension regarding the place occupied by that scheme in the general development of Bombay. Your printed note states that the Committee convened by Sir Claude Hill submitted their report but that it was not dealt with owing to the War. This is incorrect. The report was under consideration for five years and the speech delivered by Lord Lloyd on 3rd August, 1920, was intended to be and was accepted by the Press and public at the time as being the views of Government on the Committee's proposals. The fact is that the Committee's report started with the enunciation of what is now recognised as a wrong principle, viz : the necessity of retaining Colaba station, and was silent regarding the policy to be pursued in connexion with the burning question of the time, the housing of the industrial classes, as well as the policy to be followed in connexion with the Improvement Trust, its future control and utilization and the general lines on which the future development of the City was to proceed. And this leads me to the enunciation of what was and still is my general conception regarding the problem facing us in Bombay. Looking back over sixty years our troubles have been nearly always due to a failure to take a sufficiently long view. The Back Bay scheme in 1866 was based on the idea that the proper place for the docks and industrial quarters of Bombay was at Chupatti and under what is now the road to Government House. It failed with a crash that brought down the Bank of Bombay. This failure was the greatest blessing that could have befallen the City. It gave Bombay its western sea-front, it led to the opening up of Malabar Hill and it relegated the docks to the eastern side of the Island. But this was entirely unforeseen. The Government of India imposed the Cotton Excise Duty in 1896. The yield was not much to start with but by 1917 had risen to something like a million pounds a years. If, instead of diverting the proceeds to Imperial purposes, some reasonable proportion had been left to the local Government to be used in subsidizing the construction of industrial tenements, we should not have had to face the scandalous state of things, which brought about the personal intervention of the Secretary of State and Viceroy in 1918. In 1909 Lord Sydenham's Government selected as the site for the Central Post Office a spot immediately facing the Eastern approach to the Victoria Terminus. If they had foreseen the removal of Colaba and convenience of bringing the long-distance Baroda trains in to the Eastern side of the Terminus, we should not, in 1920, have been faced with the objection that, owing to the Post Office, the carriage traffic could neither enter or leave the station and had to consider a terminus at Grant Road. The same Government about the same time allowed the G.I.P. Railway to erect huge carriage and wagon shops at Parel, completely blocking all traffic from Mahim to the Eastern side of the island. And so on. In my judgment the great point about the Reclamation is and was that it furnishes (in view of the completion of Block 8, I advisedly use the present tense) the administration with what the French call a " masse de manœuvre " which can be utilized to put in motion a general re-arrangement of the southern half of the City. Let us see what I mean. Block 8 is finished. Block 7 is to be put in hand at once. Blocks 1, 2 and 3 are in hand. Obviously " Colaba " must go. That removes Wodehouse Bridge, and leaves the whole of the Station with its yard free for amalgamation with the cotton green, the godown area behind and all the miscellaneous docks and prehistoric cotton presses down to the Colaba Land and Mill and transformation into a modern residential area. Next, with the purchase of Block 8 by the Military authorities the infantry barracks, hospital, and bungalows in Marine Lines will be vacated. There will be space at once for a bridge or subway connecting Blocks 1 and 2 with the business quarter of the Fort as well of course for flats suitable for housing the ordinary business man. Next to this again we now know that, as foreseen by me in 1920, the Royal Indian Marine is to be abolished, and that the Bombay Dockyard is to let. (Incidentally anyone who had seen as I did, the manner in which the 8,000 men employed in that Dockyard during the War were

housed, would say that any Government who were parties to the continued employment of a large body of artificers in this yard without providing housing accommodation ought to be impeached). The staff required for the new Indian Navy consists of a few Royal Navy Officers who can be comfortably accommodated in flats on Block 8. This will leave the whole of Campbell Park free for office or residential purposes. The greatest danger which faces Bombay and India at the present moment is Yellow fever. It is bound to come via the Panama Canal in the next ten years. When it does, Bombay has no quarantine station. The only possible site for such a station—Butcher's Island—is occupied by the Military wireless installation. Obviously this installation must and can be moved to Block 8, or if that is not big enough, to a site on the Colaba Reclamation and Bombay will be saved a repetition of the horrors of the plague visitation.

I could go on indefinitely but will not. I set down these observations as one who started forty years ago with associations with two at least of the members of the Bombay Government who were concerned in the first Back Bay scheme. For thirty years I harboured a fixed resolve to have nothing to do with any Reclamation scheme. But in 1918 I had to change.

Note 2.

There is a statement on page 13 of the printed note which appears in a different form in some of the witnesses' statements and which it would be as well to amplify, viz. : " The final sanction to the proposed taxation and to the draft bill was received in June, 1920."

The schemes conceived dealt with a number of projects of which the Reclamation was only one. From the humanitarian point of view the most important was that for industrial housing. It is important to note that this was the only project which required legislation and the only project that required taxation. And in this case the legislation as originally conceived was of the simplest kind, namely, an addition to the octroi schedule of the Bombay Municipality empowering it to levy a town duty of rupee one per bale on all raw cotton imported into Bombay, the proceeds of the duty so levied on cotton subsequently exported to Japan and elsewhere being allocated to financing a scheme for the construction of 50,000* industrial tenements and the duty on the cotton retained for consumption in the local mills being retained by the Municipality in order to finance schemes of local improvement, more especially to meet a possible loss on housing schemes undertaken by themselves or through the Improvement Trust in the North and East of the Island. It would have been perfectly simple to put this scheme before the Legislative Council by itself. But in order to give the greatest possible publicity to the views of Government, which were eagerly awaited, the whole scheme was explained in the speech which introduced this small measure, discussion was invited and special care was taken to make the Select Committee of the Council which dealt with it as influential and representative as possible. Writing from memory, that Committee included Sir Dinshaw Petit, Sir P. C. Sethna, Sir Henry Macnaughten, Sir Parsotumdas Thakurdas, Sir Chunilal Mehta, Sir Lalbhai Samuldas, Sir Goculdas Parekh, Mr. Manmohandas Ramji and Mr. E. G. Turner, I.C.S. Among these there must have been at least five, possibly six. members of the Port Trust. At the meeting of the Legislative Council, in September, which dealt with this Bill, another measure promoted by the Bombay Port Trust was taken into consideration for which Mr. Hatch, I.C.S., the Chairman of the Trust, was appointed an additional member. So that at least half the Port Trust members were present when the general scheme received unanimous approval.

Q. 9.—As regards questions 7 and 8, do you know if there exists any written record made by you of any such conversations? If so, where can it be found?

A. 9.—

Q. 10.—Did you study Mr. Kidd's report of 1912?

A. 10.—I read Mr. Kidd's report in 1912 when it was first prepared and many times since. It was a common subject of jesting 12 years ago that he drew up the estimates and at one time proposed to carry out the work, stipulating for a commission of 5 per cent. on all savings effected.

Q. 11.—Did you study Sir George Buchanan's report of September, 1919?

A. 11.—Yes.

Q. 12.—Did you appreciate that the success of the scheme depended upon the existence of a clay of a character and extent suitable and sufficient for the proposed reclamation?

A. 12.—I realized that the work involved dredging, and knew that Mr. Kidd had found sufficient material for the purpose. As to the character of the stuff to be moved I

---

* *Note.*—25,000 tenements, costing £3,000,000, have been built free of charge in Bombay.

knew nothing. I presumed that it was similar to that used for the huge reclamations at the north end of the docks, which I had myself seen converted by the Sun from soft pudding-like material into hard stuff resembling " the pisa " used for building cottages on the Continent.

Q. 13.—Did you notice that Mr. Kidd described the clay as " stiff "?

Q. 14.—Did you notice that Sir George Buchanan described it as " hard "?

Q. 15.—Did you notice that Messrs. Simons & Co. in their letter of 12th September attached to the Report of Sir George Buchanan limited their specification of a dredger to one capable of dealing with " soft clay "?

Q. 16.—If you did notice it did you consult any and what person or persons and what opinion and/or advice did one or more give you? Who were they?

Q. 17.—In particular, did you on any and what date mention these discrepancies of description to :—

(*a*) Lord Lloyd,
(*b*) Sir George Buchanan,
(*c*) Sir Lawless Hepper,

or any other and what person or persons?

Q. 18.—Did you notice the broad similarity of the Reports of Mr. Kidd and Sir George Buchanan in relation to the details by which the amounts of the estimates were arrived at? (Compare page 13, Tables A and B of Sir George Buchanan's report.)

A. 13, 14, 15, 16, 17 and 18.—I cannot say whether I did or did not notice the description given by these persons of the clay. The matter was one for experts. I was far more concerned at the time with rates for reinforced concrete used in building industrial tenements and that for filling up rice land with earth in the north of the island, which were of importance in connexion with the projects, for which I was responsible.

Q. 19.—Were you generally aware that there was a great rise in prices of plant, material and labour in the year 1919 as compared with the year 1912?

Did you not know that the prices in 1919 were at least twice as high as those in 1912?

A. 19.—I knew that prices had risen but they were not as a matter of fact double those of 1912. I considered that as the currency Commission had recommended in 1919 that the rupee should be stabilized at two shillings, general prices must fall, as soon as the effects of the War had passed away. I did not foresee that when the Committee had enunciated this principle Government would let the rupee drop to 1s. 4d. in ten months. I should be a richer man now if I had.

Q. 20.—Did it occur to you that if Mr. Kidd's estimate of 325·23 lakhs was a fair and proper one it was impossible for the work to be done in 1919 and onwards at a cost of 367·61 lakhs?

Q. 21.—If you did notice this point did you discuss it with :—

(1) Lord Lloyd,
(2) Sir George Buchanan,
(3) Any official of the Secretariat,
(4) Any official of the Public Works Department,
(5) Any other and what person or persons?

Q. 22.—If so, state the substance of the conversations and the advice (if any) given by any such persons?

A. 20, 21 and 22.—It had always been understood that Mr. Kidd's estimates were too high. I considered that Sir George Buchanan's reasons for his estimates were adequate. I did not discuss whether his figures were sufficiently high or not. He had come to us with the recommendation of the Government of India, and I considered then and consider now that I was not responsible for details of a technical nature. I have dealt in the past with irrigation projects involving millions and have always been strictly warned that I was debarred from criticizing or making suggestions regarding technical matters.

I noticed in the reports of the evidence that some of the witnesses state that there was undue secrecy over the preliminary proceedings connected with the preparation of plans and estimates for the Reclamation. One at least claims to have found justification for his statement in a remark of my own in a paper which I wrote for the Royal Society of Arts. I have not a copy of the paper here, but my impression is that I intended to refer to the very large schemes of improvement contemplated in the north of the island, not to the Reclamation. The fact is that about this time values of land were so much, to use a slang expression, " on the jump " that it was necessary to be ultra-careful in order to avoid leakage. An instance of this occurred in the case of the Colaba scheme, the estimates for which were entirely upset by the gambling which took place in

the shares of the Colaba Land and Mill Company, due to the fact that the existence of the scheme became known in May 1919. The situation was complicated by the fact that there were numerous proposals involving the acquisition of land, some in Bombay Island, some in Salsette, which had nothing directly to do with the Development scheme. I may mention the following : Removal of Jail, removal of Mint, removal of Government Press, removal of Technical Institute (since carried out), removal of Byculla schools (since carried out), removal of B.B. & C.I. workshops (now proceeding), removal of G.I.P. workshops (decided on), construction of Mussulman College (proceeding I believe), construction of Edward VII Hospital (completed), construction of aerodrome (completed), removal of headquarters of Thana district etc. It is, I submit, obvious that in launching big schemes involving large acquisitions in the north of the island it was necessary to secure as much secrecy as possible. But this did not apply to the Reclamation.

G. S. CURTIS.

VIII.—SIR CLAUDE HILL'S REPLY TO THE COMMITTEE'S INVITATION TO HIM TO GIVE EVIDENCE.

Government Office,
Isle of Man.
8th October, 1926.

My dear Ewbank,

I have received your letter of the 6th October, with enclosures, and I write to say that my official engagements here preclude the possibility of my absenting myself from the Island within the next ten days, or indeed during the month of October.

In regard to the first of the terms of reference of the Back Bay Inquiry Committee, I would refer you to the Bombay Development Committee's Report of 1912/13. That Committee was presided over by me, and the Report represents my views at that date as to the need for expanding the area of the southern portion of the Island of Bombay, and for developing the North of the Island. I have reason to believe that that Report was the foundation upon which was later developed the detailed scheme of Back Bay Reclamation. I have nothing that I can usefully add to it as to the urgent need for providing an enlarged area round the business centre of the City. I believe that the views then expressed were sound and are so still.

I have perused the questions drawn up by the Committee, but I cannot see that I can give the Committee answers to any of them, as I left the Government of Bombay in April, 1915, and have not had first hand contact with the Reclamation problem since that date.

As Member of the Viceroy's Council in charge of the Public Works Department, I was made acquainted officially with the project for proceeding with the Back Bay Reclamation Scheme which had been foreshadowed and recommended by the Bombay Development Committee. I was naturally in favour of the scheme in the abstract, but the Government of India's interest and responsibility in connection with the scheme as submitted was limited to the technical and financial aspects of the project. On the technical side the Committee have already had the advantage of hearing the evidence of Sir Sidney Crookshank, who was my technical adviser on the scheme when it came under examination in the Public Works Department; and I could add nothing to what he has said. The investigation of the proposals on the financial side was made in the Finance Department.

Reverting to the second of the terms of reference of the Committee—namely, " to make recommendations as regards future operations "—I do not imagine that I could furnish material help to the Committee, since anything I could say would be merely matter of opinion. I would only like to offer the remark that I noted with approval that one or two of the witnesses examined (as reported in the " Times ") have drawn attention to the fact that the whole project was not merely a scheme designed to be profitable financially, but one to meet the urgent needs of the City of Bombay if she is to expand and develop, and at the same time to safeguard the health and amenities of the inhabitants. For what it is worth, my opinion is that if it is at all possible to finance it, the whole scheme should be carried to completion. It is, in my opinion, the sole means whereby the future expansion of Bombay can be assured.

Since, as I have already stated, I am not able to answer any of the questions, and since this letter states all that I am in a position to state, I venture to think that the Committee will not consider it worth while that I should come to London.

Yours sincerely,
(Signed) CLAUDE H. HILL.

IX.—REPLIES OF THE G.I.P. AND B.B. & C.I. RAILWAY ADMINISTRATIONS TO THE COMMITTEE'S INQUIRIES REGARDING THE TRANSPORT OF MOORUM.

Copy.

GREAT INDIAN PENINSULA RAILWAY.
Agent's Office,
Victoria Terminus,
Bombay.
27th August, 1926.

No. 12640 H/6.

R. B. Ewbank, Esq., C.I.E., I.C.S.,
Secretary,
Back Bay Inquiry Committee, Bombay.

Dear Sir,

Your Letter No. 441, *dated* 21/8/26.

In reply to your letter quoted above, I beg to inform you that it will be possible for this Administration to work 10 trains of moorum into Bombay daily provided a fixed time table is worked to, and also provided the B.B. & C.I. Railway are able to take them over from us at Dadar Junction.

2. The charge for a train of 50 wagons, each of 16-ton capacity, will be Rs. 225/- per train This does not include the supply of trucks. It is understood the Bombay Development Department could supply a certain number, and this railway would be asked to supply the balance. The charge for G.I.P. Railway trucks with be Rs. 2/8/0 per truck per day, this, of course, in addition to the train charge quoted above.

Yours faithfully,
(Signed) T. G. RUSSELL,
Ag. Agent.

27th August, 1926.

From The Agent
To R. B. Ewbank, Esq., C.I.E., I.C.S.,
Secretary,
Back Bay Inquiry Committee, Bombay.

Subject:

Carriage of ballast trains of the Bombay Development Department.

Dear Sir,

With reference to your letter, No. 442, of the 21st inst., and the interview I had yesterday with Sir M. Visvesvaraya and Sir F. T. Hopkinson, I understand the Committee desires to have a reply before sailing for England on Saturday. In the short time available I have not been able to examine the matter in great detail, but I give below an estimate of what we could do. As intimated in your letter, this estimate is to give an idea of the position, and is not to be taken as a definite undertaking.

At the interview of yesterday I gathered that, in addition to 10 trains a day from quarries on the B.B. & C.I. Railway, the possibility of running 10 trains a day at the same time from quarries on the G.I.P. Railway should be considered. These 10 trains would come on to this railway at Dadar Junction, and thus 20 trains a day would have to be dealt with from that point to Chowpatti Junction.

I estimate that we could take this number of trains a day from the time that the erection of our electrification overhead gear is completed, but it would require close working, and it would be essential that the trains should be worked rigidly to a time table which would be fixed with reference to our services. It would be necessary for the Development Department to provide ample facilities in the way of reception lines, etc., at Kandivli and Chowpatti to permit of working to such a time table.

It will not be possible for us to take more than four or five trains a day until the erection of electrification overhead gear is completed. The date for completion of this work is the 1st May, 1927, but some delay is anticipated owing to the coal strike in England. The extent of this delay is not known, but for purpose of estimating it might be taken as three months.

The Bombay Development Department at present run two trains a day from Kandivli, and the scale of charges is :

(1) Rs. 300/- per train when only one train is run per day.
(2) Rs. 275/- per train when two and up to four trains are run per day.
(3) Rs. 250/- per train when over four trains are run per day.

I estimate that we could quote Rs. 225/- per train for over six trains a day, and we might be able to quote Rs. 200/- per train for 10 trains.

These charges are for trains from Kandivli to Chowpatti, and do not include the supply of trucks. The Bombay Development Department at present supply their own trucks.

I understand that the railway would be asked to supply the balance of trucks required. The number required for 10 trains a day would depend on the rate at which they were turned round. I think, however, that we could supply all that would be required either from our own stocks or from other railways. The charge for trucks supplied by this railway would be Rs. 2/8/- per diem per truck, this being in addition to the train charge quoted above.

Yours faithfully,

(Signed) M. W.,

for Agent.

X.—BOMBAY GOVERNMENT'S PRESS NOTE, DATED 16TH OCTOBER, 1926.

BACK BAY RECLAMATION.

Government Decide to Complete Block 7.

An *ad interim* report submitted by the Back Bay Enquiry Committee at the request of the Government of Bombay regarding the next season's work has been published for general information by the Government of India.

2. In that report the Committee unanimously recommend the reclamation of Blocks 1, 2 and 8; block 1 by dredging from Back Bay in the next working season, and thereafter both blocks 1 and 2 by either dredging or dry filling, whichever may prove more economical or advantageous. The dredger, they say, should work three shifts. Block 8 should be completed as quickly as possible by dry filling. Storm-water drains 6 and 7 in blocks 1 and 2 should also be completed, and parapets in blocks 1 and 8 constructed in due course. This recommendation, confirming, as it does, the recommendations of the majority of the Advisory Committee and Mr. Kay's Committee, has been accepted by the Government of Bombay, and work in blocks 1 and 8 will proceed accordingly during the ensuing working season.

3. With regard to block 7, the Committee note that its area is 6,54,000 square yards, and that the quantity of dredged filling required to fill this block is two million and fifty thousand cubic yards. They consider that if the dredger is worked efficiently for three shifts daily, the block should be completed, so far as the dredged material only is concerned, in the course of the season, at a rate of eight annas per cubic yard, and that this rate is much below the cost of any other method of filling at some future date. The cost of moorum topping, development, interest and depreciation has, of course, to be added to this. The Committee note also that dredging plant is available on the spot, and that the superior staff cannot be dispensed with without six months' notice. At the same time, they are impressed with the uncertainty regarding the date and rates at which the land, if reclaimed, could be disposed of, and this makes them doubtful if it would be a sound proposition financially. They therefore consider, in the circumstances, that it is for the local Government to decide for themselves whether any action, and if so, what, should be taken in respect of this block pending the decision of Government on the final report of the Committee.

4. In paragraphs 30 and 31 of their report, the Kay Committee recorded their conclusion, on the figures of cost adopted by Mr. Neilson's Committee, that the present value of the total cost of completing block 7 would amount to Rs. 48.50 lakhs, as compared with Rs. 36.97 lakhs, the estimated present value of the recoupment, and that the reclamation and development of the area would not be a paying proposition. They accordingly recommended that the reclamation of block 7 should not be proceeded with at present.

5. Government have now re-examined the financial aspect of the completion of this block in the light of the remarks made by the Back Bay Enquiry

Committee in their *ad interim* report, with the following result. It would not be possible to work the dredgers three eight-hour shifts until additional staff could be obtained from England, and it would be necessary to provide accommodation on shore for the extra men, as that on the dredgers is fully occupied. It is quite possible, however, under suitable arrangements, to work the plant two 12-hour shifts with the existing crews; and it is estimated, on the actual figures of the season 1925-26, that, if this is done, it should be possible to obtain an output of 20,21,300 cubic yards of consolidated filling during the coming season at a cost of Re. 0.62 per cubic yard, based on the total working costs of the plant incurred, and to be incurred, during the period 1st June, 1926, to 31st May, 1927.

6. As regards the output, the quantity of dredged filling required to complete block 7 is 20,50,000 cubic yards, which is slightly more than the estimated output of the plant for 2 twelve-hour shifts, based on the actuals of 1925-26. During that season, however, 17 working days were lost owing to the necessity of stiffening the Colaba, and 10 working days on account of bad weather, and there seems no reason to suppose that in a normal season's working, with 2 twelve-hour shifts, the quantity of dredged filling required for block 7 cannot be obtained.

7. In regard to the rate, this, as stated above, is estimated at Re. 0.62 per cubic yard, which includes, however, the expenditure on dredging staff, maintenance, etc., already incurred during the current year since the close of the last dredging season on 31st May, 1926. Moreover, if it is decided to abandon dredging, the present superior staff have to be given 6 months notice. These two items total Rs. 3.50 lakhs and represent expenditure, which cannot in any case be avoided, corresponding to a cost of Re. 0.17 per cubic yard of consolidated filling. Allowing for this, the difference between the rate of Re. 0.50 per cubic yard suggested by the Back Bay Inquiry Committee, and the departmental estimate of Re. 0.62 per cubic yard, is only Re. 0.05, and it seems reasonable to suppose that the rate given by the Committee represents the additional expenditure in which they consider Government will be involved, if it is decided to continue dredging during the coming season, the fact that the departmental estimate is slightly lower being probably due to its being based on 2 twelve-hour, instead of 3 eight-hour, shifts.

8. Apart from the question of output and rate due to working the plant 24 hours per day, Government are of opinion that in one other respect the forecast on which Mr. Kay's Committee based their conclusions may reasonably be modified. The forecast is based on the assumption that the disposal of the land will take 20 years, but provision is made for the completion of the development, i.e., roads, drains, lighting, etc., in 5 years. It is unusual to undertake such expenditure so far in advance of actual disposal of the land, and it is considered reasonable to spread it over 15 years, the development being completed, even then, 5 years before the last plot is sold.

9. On the basis of working the plant 24 hours per day, and taking 15 years for the development of the area, the financial position is estimated to be as follows :—

COST OF RECLAMATION.

Season 1st October, 1926, to 31st May, 1927.

	Rs. lakhs.
(*a*) Moorum filling (sealing wall and bund) 1,44,000 cubic yards @ Rs. 1.57	2.26
(*b*) Dredged filing 20,50,000 cubic yards @ Rs. 0.62	12.71
	14.97
Establishment charges @ 15 per cent.	2.25
	17.22
Deduct expenditure already incurred or inevitably to be incurred	3.50
	13.72

Assuming this expenditure to be evenly distributed over the eight months, and writing it back to 1st October, 1926, the present value cost on that date would be Rs. 13.45 lakhs.

Season 1927-28 No work done.
Season 1928-29 } Work of moorum topping to be spread over these two years.
Season 1929-30 }

	Rs. lakhs.
Moorum topping	
5,84,000 cubic yards @ Rs. 1.57	9.17
Establishment at 15 per cent.	1.38
	10.55
Written back from 1st April, 1929, to 1st October, 1926, i.e., $2\frac{1}{2}$ years, the present value cost is	9.12
The total present value additional cost of reclamation is therefore	
13.45 *plus* 9.12	22.57 lakhs.

10. *Cost of Development.*—Mr. Kay's Committee assumed that the gross area of 6·54 lakhs square yards in block 7 would yield a net building area of 3·40 lakhs square yards based on Mr. Davidge's provisional lay-out. This can be increased by a further 60,000 square yards by (1) throwing part of the proposed recreation ground into the building area, and (2) reducing by 20,000 square yards the area under roads. Thus a total building area of 4·00 lakhs square yards can be obtained, and the cost of development be reduced by Rs. 2·40 lakhs. This Rs. 2·40 lakhs may, for purposes of the forecast, be taken to balance the extra expenditure which Mr. Kay's Committee anticipate may have to be incurred on temporary arrangements for disposal of sewage. Taking then the figure accepted by Mr. Kay's Committee, Rs. 26·5 lakhs, as the cost of development spread over 15 years from 1930-31, the present value of the expenditure on 1st October, 1926, would be Rs. 13·96 lakhs. The total present value of the cost of completion of block 7 is, therefore :—

Present value cost of reclamation	Rs. 22·57 lakhs
Present value cost of development	Rs. 13·96 lakhs
Total present value cost of completion	Rs. 36·53 lakhs

11. *Recoupment.*—4·00 lakhs square yards at Rs. 25/- per square yard spread over 20 years, i.e., 20,000 square yards per year, bringing in Rs. 5 lakhs per annum for 20 years from 1931-32.

The value on 1st October, 1926, of Rs. 5 lakhs per annum for 20 years from 1931-32 is ... ... 45·43 lakhs

According to this forecast, therefore, if the plant is worked 24 hours a day during the coming season, and the cost of development is spread over 15 years, the completion of block 7 will result in a reduction of debt at present value of 45·43 − 36·53 = Rs. 8·90 lakhs.

12. There are two subsidiary points raised in the report of Mr. Kay's Committee in regard to block 7. The first is as regards the supply of moorum, paragraphs 22 and 23 of the report. The fear is expressed that if block 7 is undertaken, the diversion of moorum, for sealing the sea wall and bund, may prevent the completion of block 8 by the estimated date 31st March, 1928. Government have had this matter investigated and have ascertained that arrangements have already been made with the B.B & C.I. Railway for doubling the supply of moorum with the existing rolling stock, with the result that not only will there be sufficient moorum for block 7, but the completion of block 8 can be considerably accelerated.

13. The second point is that of sewage disposal in block 7, dealt with in paragraphs 26 and 27 of the report of Mr. Kay's Committee. It will be seen that the Committee apprehended very considerable expenditure on temporary sewage disposal arrangements, owing to the probability that the construction of the proposed municipal outfall at Colaba might be indefinitely postponed. On an examination of the conditions it has been found that it will be quite possible to lay the system of sewers in the area in their final position, and, pending the construction of the municipal intercepting sewer, to provide a sump from which the sewage can be pumped into a septic tank, the effluent from which will

flow into a neighbouring storm-water drain. The additional cost of the temporary work, over and above the cost of the sewers included in the cost of development, will amount to approximately Rs. 1·13 lakhs which will be more than covered by the saving, Rs. 2·40 lakhs, due to the proposed reduction of the area under roads.

14. After taking all the factors in the case into consideration, Government have come to the conclusion that the balance of advantage is in favour of the completion of block 7, and they have accordingly decided to proceed with dredging from the harbour into block 7 during the coming season, working the plant 24 hours a day.

Government do not propose to take any further action until they have had an opportunity of considering the report of the Enquiry Committee appointed by the Government of India.
